The Nation.

NEW YORK, THURSDAY, JANUARY 5, 1905.

The Week.

The siege of Port Arthur, which ended on Sunday, will go down in history as one of the most memorable in all the annals of warfare. There have been longer sieges—the Allies lay three hundred and fifty days before Sevastopol and sacrificed 100,000 lives in order to reduce it; but none more stubbornly contested. The investment of Plevna, which lasted one hundred and forty-four days, ended more dramatically with Osman Pasha's fruitless sortie. Port Arthur, the most elaborately fortified city in the world, was forced to capitulate because, isolated by land and by sea, all its great resources in the way of men, ammunition, and supplies were at an end. The event enforces the old truth that what man has built up, man can tear down; and makes it plain that, in the historical contest between the assailants and defenders of fortified positions, the chances still favor a well-directed and sufficiently vigorous attack. Port Arthur was the first beleaguered fort to be defended by the aid of the latest modern inventions. It had its electricity, its searchlights, its telephones, even its wireless telegraphy. Barbed-wire defences, mines, high-power explosives, the latest range-finders, the newest machine guns, all failed to stop the most determined assaults of modern times. The very recklessness of life displayed by the Japanese—in violation of that principle of warfare which proclaims him a great general who achieves his end with a minimum human sacrifice—made a successful outcome of the defence impossible so long as Nogi had troops to hurl against the entrenchments. For the Oriental character, as contrasted with the Western, this is a great triumph. The troops of a first-class European Power would also have accomplished the fall of Port Arthur, but it may well be questioned whether it would not have taken much longer and become purely a matter of starving out Gen. Stoessel.

So far as that general and his men are concerned, their defence is the most creditable event in the long chronicle of Russia's defeats and disasters. It was known long before the Japanese surrounded Port Arthur that Russian soldiers were the ideal defenders of fortified positions, and Gen. Stoessel has strongly emphasized this truth. Not until the whole history of the siege is before us can the final word be said about his leadership, and whether he showed all the initiative his position demanded. But his fame is secure even though he has added nothing new to the military theory of sieges, and was forced in the end to succumb to the historic methods of mining and countermining and of concentrating a tremendous artillery fire on one link at a time in the chain of forts with which Port Arthur was provided. If Gen. Stoessel's naval allies had shown one-tenth the courage and determination which seem to have inspired him and his subordinates, the whole story of Port Arthur might have been different.

Concerning the general strategy of the Russians, there is already a sharp difference of opinion among experts. Capt. Mahan was of the belief last summer that the defence of Port Arthur was the salvation of the Russians; that every week's detention of Nogi's army there made for Kuropatkin's eventual success in the North. An English military writer declares, on the other hand, that the history of the campaign is one "of criminal ignorance of the first principles of strategy by sea and land"; that the retention of Port Arthur was a worse entanglement for the Russians than Ladysmith for the British in South Africa; that in consequence the entire campaign "resolved itself into a costly, useless, and stupid effort to relieve a fortress deliberately isolated," with the result that the Russian army broke and spent itself in one frantic effort after another to attain the unattainable. All this is very easily said on the Strand; but Russia could no more have abandoned its enormously costly fort without firing a shot than the British could have abandoned Sir George White at Ladysmith, on the ground that strategical considerations made it advisable. Moreover, it cannot be gainsaid that Stoessel's heroic defence has cost the Japanese very dear, not merely in men, but in money and military *matériel*. In all three her resources are limited; if Russia wins in the end, it will be for this reason, and further praise will then be showered upon Stoessel for his share in bringing the Japanese to a state of exhaustion.

Upon the disposal of Port Arthur hangs ultimately the destiny of Northern China. After the Russians had signed the lease of the Kwantung peninsula, there followed the German descent upon Shantung and the temporary occupation of Wei-hai-wei by the English. Would the restoration of Port Arthur to China be the signal for the Germans also to withdraw? That, perhaps, is too much to hope. Indeed, the future of the Liao-tung province is too obscure to afford a safe basis for speculation, but this much is certain: that Japanese ascendency in southern Mantchuria, whether direct or through a protectorate, would mean a sharp check to European aggression in North China. One hears already that the Chinese army is to be thoroughly reorganized in that region; and the news of the expulsion of the Russians from the Mantchurian littoral cannot but have a great effect in quickening all Eastern Asia to national self-consciousness. It will behoove the Western nations to profit by Russia's example and accept the facts that the Far East is coming to its own, and that the habit of regarding China as so much unclaimed area to be marked for exploitation has become a perilous anachronism.

Among the newspapers there is a pathetic unanimity of assent to the Government suit against the General Paper Company. Even the journals that see in all actions against the Trusts the impending dissolution of the Federal system, hold their peace. It makes a difference whose raw product is monopolized. Indeed, the secretary of the company showed a sense of the situation when he said he feared the suit would have uncommon publicity. His remarks on the formation of this selling company were, as reported, of almost infantine candor; so far was the General Paper Company from breaking any law, State or national, that it had followed the unusual procedure of employing the most learned counsel, so that the company might not clash, even accidentally, with a statute. The appeal from a United States court to one's own counsel is certainly unusual, but in view of the prevailing temper of a portion of the press it may yet have to be admitted. It is too much to hope, however, that so needful a change in procedure will take place in President Roosevelt's time. In all seriousness, there is every reason to believe that the General Paper Company is only the front that a burdensome monopoly presents to the public. And so long as Congress withholds some such general corporation regulation as Mr. Garfield urges, there is nothing to do but to use the at best cumbersome machinery of the various anti-monopoly acts.

Testimony before the Interstate Commerce Commission at Chicago on Thursday furnished added proof of the President's wisdom in making Secretary Morton spokesman of the Administration in the matter of nefarious railway practices. It appears from the evidence that, while Mr. Morton was traffic manager of the Santa Fé Railroad, secret rebates were given by it to the Colorado Fuel

and Iron Company. Their result was, and was intended to be, to kill off a competitor and create a coal monopoly. If the facts are as alleged, the railway officials entered into an unlawful agreement, amounting to a conspiracy, with the Fuel Company. Secret circulars of instructions to agents were laid before the Commission, showing that the Fuel Company was inducing or compelling the railroads to give it such rebates that it could sell coal at a price equal to the bare freight rates exacted of other shippers. If Mr. Morton knew of this arrangement, and assented to it, he was a violator of the law; if not, his being in charge of the Santa Fé traffic was only a joke. In either case, his present earnest championing of national control of railroad rates seems strangely like the attitude of a man begging the Government to restrain his criminal propensities.

Another United States Senator under indictment for fraud and bribery, with a Representative joined to him in the same distinction, reminds us in what a strange borderland of morality too many of our public men dwell. They become habituated to acts so near the margin of the law that they scarcely know themselves when they step clean over. Representative Hermann plaintively says that "we all" do the sort of thing for which a jury has indicted him. In other words, when called upon to serve a constituent, a Congressman is expected to stop at nothing. As to Senator Mitchell, the chief surprise at Washington is, unhappily, not that he did the things alleged, but that he was so little astute as to be caught at them. Of course, fair-minded men will suspend final judgment in these particular cases until the legal proofs are forthcoming: but enough is known to show that the land frauds, like the postal thievery, disclose the seamy side of prosperity. When it means, as it is too often made to mean, a mad rush to be rich, public servants cannot escape the demoralization. In Grant's second Administration, George F. Hoar, then a member of the House, made a startling exposure of the lengths to which official corruption had gone. Mr. Roosevelt can save his second Administration from a similar reproach only by insisting that the prosecuting officers hew to the line.

Our State Department regards the situation in Morocco as serious, and so evidently does the French Government, but how lucky Mr. Hay must now think it that he did not get "Raisuli dead" last June. "Perdicaris living" to-day comes forward to affirm that the terrible Raisuli is the only man who can maintain order in Morocco, since he is "superior in many respects to any of the officials among his countrymen." Should he by any chance come to the direction of affairs in Morocco, we hope that he will be magnanimous, and not treasure up against the United States the dispatch demanding his head. If he is as astute as Perdicaris asserts him to be, he will know that the dispatch was intended solely for the Republican Convention. With the election, that particular bit of blather expired. A living dog is better than a dead campaign lion; and Raisuli may congratulate himself that the Administration was merely slaying him with its mouth.

Secretary Taft seems to be proceeding in the matter of tariff reductions on Philippine products much as Gen. Grant, when a boy, went about selling his father's horse. "The price is $150, but I will take $100." "I am hoping," says Secretary Taft, "to get the tariff on sugar and tobacco down to 25 per cent., but I suppose I'll take what I can get." No further notice to the other side is required. Mr. Taft wants Congress to do an act of justice to the Filipinos, but if it won't—why, he will put up with injustice. He has tried this method of speaking the devil fair with such poor success in the past that we should think he would now be ready to make experiment of a stand-up fight. In the matter of secret conciliatory negotiations, the protected interests, which do not care if the Filipinos starve, can beat him every time.

Governor Carter of Hawaii, in his annual report, makes a plea for relaxation of the Chinese immigration laws. So far we are with him, holding that these laws are barbarous in principle and oppressive in their actual application. But before any friend of the Chinaman goes the whole way with the picturesque Governor of our distant possession, let him consider what kind of Chinese immigration is wanted in Hawaii. As to that, Governor Carter expresses himself with exemplary frankness, and says he desires only "a limited number under restriction, requiring their return at the end of a given number of years and confining them entirely to these islands." These business-like words cover an old abuse—bonded coolie labor with its attendant circumstances of shiploads of temporary serfs, guarded compounds, forced labor, and fugitive-slave laws. In other words, Governor Carter wants for Hawaii what Lord Milner, in the Chinese Labor act, demanded for the Transvaal. If the earth is to be exploited at a speed pleasing to the great commercial nations, some such system is necessary. But it, even confirmed Imperialists will admit, is the shady side of the Imperial idea. Yet whenever the matter comes seriously before Congress we shall doubtless have an opportunist clergy fairly outdoing their British brethren in demonstrating that the coolie compound is a providential means for spreading, with the blessings of civilization, those of Christianity.

Though the impression seems to be growing that Addicks will again fail to get his coveted Senatorship, this can hardly be attributed to an access of political virtue among Delaware voters. They have sent to Dover 23 members of the Addicks faction, as against 10 of the Regular Republicans and 20 Democrats. The Legislature of two years ago, which broke the deadlock by a compromise that gave the longer term to an Addicks man, contained 22 Addicks and 8 Anti-Addicks Republicans to 21 Democrats. Col. Dupont's fitness for the Senatorship is appealing more strongly to the legislators now that Addicks has begun to economize on his political expenditures and the candidate of the Regulars has stepped into the breach. Meanwhile, the national Administration is helping the anti-Addicks faction, and the last three Federal appointments have come from that side. A credible correspondent reports Senator Ball's confident prediction that his seat in the Senate will be filled by "somebody other than Addicks." The Republican National Committee's benediction this year does not seem to have brought good luck. The Spooner faction, which it "recognized" in Wisconsin, was badly beaten; and, for all the stamp of "regularity" which it gave to Addicks, he may be farther than ever from the object of his ambition.

The New York Municipal Civil Service Commission has laudably done away with the "re-rating" scandal in competitive examinations. The would-be civil servant is naturally as likely as the college student to take issue with the examiner who gives his paper a low mark, yet the practice of allowing appeals for revision, unless in cases of palpable error in marking, is subject to the worst abuses. The candidate's identity is unknown to the examiner, being designated only by a number, but when he appeals for a re-rating his name must, of course, appear, and whatever "pull" he possesses can become effective. Again, in a competitive examination, the marks are in any case only relative, graded according to a standard in the examiner's mind, and a re-rating of one paper without examination of the others means a departure from the whole principle of the comparative test. The number of unsuccessful candidates who have appealed to the municipal board has been enormously large in the past. In the first half of this year there were 1,615 appeals, 1,449 of them for changes in the examination papers themselves. The United States Civil Service Commission in a year heard but 419 appeals and the New York State Commission only 25.

Massachusetts has very few appeals, while Buffalo and Chicago have abolished the right entirely except for manifest error. The great number of appeals in this city, fortunately, does not imply that a corresponding proportion of re-rating is actually made. Out of the 1,449 appeals, only 206 were granted, while of the 150 appeals heard by the new Commission in October but 4 were granted. But the system gave opportunities for favoritism, to say nothing of unintentional injustice, and the Commission has but learned of experience in abolishing it.

The reported plan of burning a million or two bales of cotton in the South, so as to keep up the price, is doubtless not to be taken too seriously. As with the old panacea of "reducing acreage," each planter will count upon some silly neighbor, or an idiot in the next county, to apply the remedy, while he himself pockets the gains. There is, however, striking evidence in this alleged scheme of the way in which protection has turned our economic notions topsy-turvy. We admit, of course, that the unexpectedly large crop has its awkward side for the cotton trade, and especially, just at present, for the cotton manufacturers. Yet it is fairly astounding to find scarcity thus held up as the great blessing. For that is what this worship of high prices really comes to. Apparently intelligent men act as if the great aim and result of civilization were *not* to enable the world to be fed and clothed as cheaply and comfortably as possible. When drought or flood or fire cuts off the food supply, or when war makes the necessaries of life vanish, we account it a terrible calamity; but if we can approximate the same state of affairs by vexatious laws or artificial interference with the bounty of nature, we pose as benefactors. This only goes to show how protection may befuddle a whole people. Bastiat would find new material for his 'Economic Sophisms' in the seeming devotion of Americans to the idea that plenty is a curse.

The President has with other potentates given his name to a committee for the excavation of Herculaneum—a watering-place in which the "cottagers" lived neither the strenuous nor the simple life. Yet the life of those wealthy Romans had something to be said for it. The owners of those great villas by the sea lived in an elegance such as the world has rarely seen since. The casual tourist about Naples probably fails to realize that the most beautiful objects came from Herculaneum, and that the prevalent quality of Pompeii is cheap and vulgar. Perhaps too much pains have been spent upon the uncovering of that godless Asbury Park; it is easy digging, and there is a tempting amount of rather third-class antiquity to be revealed. The select colony of Herculaneum, on the contrary, was covered by lava mud, not cinders, and it will presumably cost as much to excavate single villas as it does to bring up entire quarters in Pompeii. But the reward should be great. The splendid bronzes and the manuscripts in the Naples Museum are from Herculaneum. In fact, we can imagine no drawback to the scheme which Dr. Charles Waldstein is promoting so efficiently, except the expense.

Mr. Choate's retirement from the English Embassy follows a service officially satisfactory, and attended by popularity. The American Ambassador to England long since ceased to be merely a diplomat. Most of the official business is now done direct between Washington and London, and the routine duties can be discharged by any red-tape mind. But it is as the representative and mouthpiece of the American people that our Ambassador has come to hold his unique position. To interpret us to England; to enter easily into the intellectual life of English literary and artistic and university circles; to be a dignified figure on public occasions, and to speak the right word when some anniversary or historic celebration brings out the spiritual kinship of the two nations—such have been his high functions. In discharging these, Mr. Choate has necessarily suffered, as any man would, from standing in the shadow of his predecessors. His wit was not at first appreciated, and his literature has occasionally had the air of being improvised. Still, Mr. Choate's flexible talent enabled him soon to adjust himself to his position, and his retirement is to be regretted.

Earl Roberts, like Kipling and other military lights, would transform all England into a voluntary training camp as a substitute for enforced army service. Because conscription in time of peace is impossible, the Field Marshal would have every able-bodied Englishman, no matter what his station in society, undergo "some kind of military training in youth sufficient to enable him to shoot straight and carry out simple orders, if ever his services are required for national defence." In other words, the Salisbury idea of universal rifle clubs is again revived, only in a less crude form. Kipling's "Army of a Dream," with its schoolboys spending their Saturday afternoons outmanœuvring and defeating the picked Imperial Guards, is still a bit beyond Earl Roberts's vision, and will, fortunately for England, continue to be such stuff as dreams—or nightmares—are made of. But England's Imperialists will find much in the noble Earl's views to make them believe that they can indulge in Imperialism at a lower price than Continental nations. For this is what it comes down to. England wants not merely the greatest navy, but an army whch will permit of her placing some 250,000 or 300,000 trained troops in an over-sea country as soon as war is declared. But, being a nation of shopkeepers, her people naturally resent the idea of being forced to give up one or two years of their lives in drilling that Balfours and Chamberlains may carry out their ideas of territorial aggrandizement across the seas.

Whether Earl Roberts's proposals are practical remains to be seen. One thing is certain: there will never be any agreement among military men as to the amount of training your fledgling Britisher should have. Field Marshal Roberts might be content with qualifying boys as marksmen and as proficient in the manual of arms, but Field Marshal Smith or Jones would be certain to insist upon a universal knowledge of guard and picket duty, open-order formations, and the elements of military engineering, as essential to the nation's safety. Of course, Earl Roberts states well-known facts when he writes that the new weapons necessitate new methods of fighting, and diminish the control of officers over their men. Almost everybody knew this before the Boer war except the British army, which has had another object-lesson in the readiness with which Japanese sergeants and corporals assume responsibilities—even to commanding battalions—when their superiors are shot down. No one will question Earl Roberts's right to demand thousands of trained reserve officers, but many people will add that the best way to get good reserve officers is to have efficient and well-trained active officers.

Amid confusion of comment on the Czar's reform ukase, nothing is more instructive than to note that practically all the changes asked by Count Tolstoy some three years ago have been approved in principle. At that time the venerable quietist believed himself to be dying, and addressed to the Czar a personal letter asking the abrogation of the laws that afflict peasants and workmen as such. Obviously, the promises made in the imperial rescript are the literal answer to this appeal. Accordingly, if the Russian situation is as black as it is painted, it is not because of any reactionary policy of the Czar, but because of the incalculably disturbing influence of the disaster in the Far East, or the too precipitate temper of the reformers. It is possible that all the news from Russia recently has had an unduly alarmist coloring, and, in particular, that criticicm of the Czar's ukase has been based upon ignorance of the actual conditions and possibilities of reform in Russia.

THE CONVERSION OF GRIGGS.

Several corporation lawyers have suddenly seen a great light since the Garfield report, and have discovered that they always were the stoutest of State's-rights men; but from no eyes have the scales fallen more marvellously than from those of the ex-Attorney-General, John W. Griggs. He sees a terrible usurpation threatened in the proposal of Federal licenses to do interstate business. That would mean that "almost every right of the States can be destroyed." Mr. Griggs has not so read the Constitution; and unless specific power to do so is nominated in that bond, he would shrink with horror from the thought of making the Federal Government "the critic or corrector of the States." Many have been strict constructionists, but it would seem that Mr. Griggs surpasses them all.

Hence one's first feeling is that it must have been some other Griggs who, as Attorney-General of the United States, argued the Insular cases before the Supreme Court almost exactly four years ago. *That* Griggs did not waste his time groping about among the literal provisions of the Constitution. He was boldly and loftily for having this nation exercise "all of the ordinary and necessary sovereign powers of an independent nation." "Why," he asked with impassioned eloquence, "seek needlessly to limit and restrain the national functions?" "Why should this Government be considered to have less freedom of action than other nations?" And the Griggs of that occasion laid down the following canon of Constitutional interpretation: "Instead of seeking strict and narrow construction," he said, "the powers of the Executive and of the legislative branches were to be so construed as to give them a wise and safe discretion." But at that time, of course, it was only a question of extinguishing the national existence of 8,000,000 of people. The Constitution, under a Griggsian construction, was adequate for that; but when it is proposed to have this same sovereign and all-powerful nation clip the claws of a corporation, Mr. Griggs sees the whole Constitutional structure crashing about his head.

We forbear to press the comicality of all this; a Saul among the prophets may safely be left to the risibles of his audience. But it is late in the day to begin arguing against a broad application of the Constitutional power of Congress to "regulate commerce" among the States. Historically, it may well be true that the clause was intended simply to deprive the States of power to vex each other's commerce—a power exercised so calamitously under the Articles of Confederation. Yet a long line of judicial decisions has sustained multiform legislation by Congress under that grant of power; and to-day it stands as one of those general principles, or legal maxims, out of which measures to suit the need of the hour may easily be drawn. Certainly it is no great abuse of the Constitution to take a clause designed to prevent one State from hampering the commerce of another, and use it to prevent a corporation chartered by one State from oppressing the citizens of another.

Commissioner Garfield quietly sums up the law and the facts when he closes his review of the Constitutional powers of Congress over corporate business by saying:

> "Briefly, as to interstate and foreign commerce, the United States is one country, one legislative area; and when Federal regulation of such commerce enters any given State for the purpose of operating on such commerce, it enters it not as foreign territory, but as a part of its own jurisdiction."

Insensibly yet inevitably this idea has come to pervade the public mind. Prof. J. W. Burgess, in his St. Louis address last September on "Present Problems of Constitutional Law," which is published in the current number of the *Political Science Quarterly*, mentioned the national regulation of commerce as a matter now calling for action in the United States. Said this philosophical and detached commentator:

> "Whatever may have been natural a century ago, when the settled parts of the commonwealths of this Union were separated from each other by comparatively impassable districts of primeval forest and there was comparatively little intercourse between them, now, when these obstacles have entirely disappeared and intercourse is so active that no man notes his passage from one commonwealth into another, it has become entirely unnatural and scarcely longer endurable that the law governing commerce should not be exclusively national. The existence of the common law as the basis of the law of the commonwealths upon this subject has minimized the difficulty of a great nation getting on with systems of local commercial law; but the differences in detail, at first hardly noticeable, have now, on account of the vast development in the complexity of these relations, become almost unendurable."

Professor Burgess would have the matter dealt with, preferably, by Constitutional amendment; but if it cannot be done in that way, "then the United States judiciary must put a much more liberal interpretation upon the existing commerce clauses of the Constitution."

No sensible man counsels any sudden or violent step in this business. The whole matter will have to be thresned out in the press and in Congress. Meanwhile, we cannot but feel that it is delicious impudence for the men who have for years been appealing to Cæsar, now to make a great outcry when told that to Cæsar they shall go. They have run to the general Government for every imaginable aid to their business. They have lobbied for land grants, log-rolled for tariff stealings, plotted for ship subsidies, schemed for appropriations, intrigued for Government contracts, conspired for new territory to exploit; yet when it is proposed that the Government which has thus fed leviathan shall now put a hook in his jaw, we are told that all such resorts to Federal authority are fraught with dangers to liberty. Protest does not lie in the mouth of Mr. Griggs and men like him. It is not for them to make such an ado when their own chalice is commended to their lips.

PROMOTIONS IN THE GOVERNMENT SERVICE.

In a remarkable letter to the *Sun* of Saturday last, a writer, vouched for as a "distinguished officer," made a plea for radically changing our system of naval promotions by making them rewards for the best men eligible for advancement. He would have the inefficient stay behind until they had reached a certain age, when they should retire without having reached command rank. As matters stand now, promotion boards hesitate to find a man unfit for advancement, because rejection generally means ejection from the service at an age when an officer is unfitted to turn readily to a civilian employment. The same condition is found in the army, except that there an officer has the privilege of a second examination at the end of a year if he fails in his first. Since this procedure was established, thirteen years ago, no officers save second lieutenants have been dropped as unfit for promotion, and not a dozen of these.

This does not mean that all the officers advanced were really fit for higher rank. In the case of majors and lieutenant-colonels there is no examination at all, while there are plenty of captains who slip through the last examinations merely because their fellows will not discharge a man whose first gray hairs have begun to appear. One of our recent Secretaries of War bemoaned the fact that he could not even get retirement boards to retire incapacitated officers. In one case known to us a captain who could not get on a horse or march two miles, was solemnly passed by a board of moss-backed comrades who were quite ready to swear that he was fit to command a battalion in the field. It is human nature not to turn out a man to starve when he is fifty. And, besides, there is a feeling that an officer's commission gives him a permanent tenure. The Government may retire a man for age or disability, but it must not dismiss him unless he is publicly intoxicated or embezzles by duplicating his pay accounts.

This whole question of the permanence of Government employees and their advancement is not limited to the military branches of our Government. Proposals for removing the dead-wood within the civil service appear at every session of Congress, as do plans for the creation of a retired list for superannuated employees. Mr. John Sharp Williams's plan is to appoint clerks for a

long term, such as sixteen years. If inefficient, they could be turned out then, and if valuable, they could be reappointed. Army and navy retired lists were not established until after the outbreak of the civil war, when it became necessary to get rid of a lot of aged and infirm officers. Hence those who are working for some kind of pension for civil employees take heart by remembering that the classified civil service is not as long established as was the army when it got retired pay for officers and men. But the mere establishment of pensions does not reach the difficulty with which the army and navy are especially confronted—how to get the same amount of efficiency out of a man who has been twenty years in the service as that which he displayed on entering the Government's employ. In civil occupations a man must at all times keep abreast of his work and the developments of his profession or business. There are no tender-hearted retiring boards to retain him on full pay when he has reached the limit of his usefulness.

Civil service reformers are ready to admit that some solution for this question must be found before the system will be beyond criticism. A head of a department has, of course, the right to dismiss an inefficient subordinate at any time on the presentation of charges in writing. But the procedure results in so much trouble in the form of protests and visits from politicians that it is generally resorted to only where there is obvious misconduct, or neglect of duty through absence. The power of dismissal is practically of no avail as a stimulus to efficiency, while promotions are hardly more a recognition of exceptional service than they are in the army or navy.

No elaborate legislation is needed to make advancements, in either the army or navy, rewards of merit. In the army it would require a statute prescribing the examination of every officer up to and including the rank of colonel as to his mental, *moral*, and professional fitness for the rank to which he is eligible. As matters stand now, many officers are passed on upward who can drill a company without an error and pass a required text-book examination, but the examiners have no right to question a man's moral fitness or his capacity to command. He may be a roué or a notorious gambler, or so destitute of the power to lead and discipline his subordinates that his men desert in blocks of five; but if he can explain the theory of Cossack outposts and reel off a hastily memorized manual for advanced guard duty, he is passed with flying colors. Should an officer fail in his mental examination, after fifteen or twenty years' service, he ought to have the right of retirement on half-pay; if he should be found unfit by reason of personal misconduct or bad habits, the Government would be under no obligation to pay him a single cent beyond the year's pay now granted to an officer honorably discharged for failure in examinations.

Practically the same regulations would accomplish for the navy precisely what is urged by the writer in the *Sun*, always provided that the moral and professional tone of both services can be raised so that examining and retiring boards will do their duty. If this spirit of sinking personal feelings in the interest of the Government cannot be instilled at West Point and Annapolis, or by the civilian officials of the respective departments at Washington, then there should be appointed examining and retiring boards, composed partly of retired officers and partly of civilians, who could be relied upon to dispense justice without fear or favor. Much more could be done by the secretaries of the navy and of war than is now attempted. For instance, the threat to court-martial such a board as passed the captain above referred to would have a remarkably tonic effect. Similar permanent examining boards before which civilian clerks should appear at intervals, or when up for promotion, may yet be established; for if permanence of tenure is essential to the proper conduct of the Government business, it is no part of the contract between it and its employee that the latter shall accomplish only 50 per cent. as much as his brother who works for the electric-light company across the way.

THE TRIUMPH OF OPTIMISM.

"I had as lief submit my claims to sit here to the electorate of New York as to the Legislature of New York. When my term expires, I shall have reached a period of life when it will be exceedingly doubtful whether I shall care to come here again."

These words are from a speech of Chauncey M. Depew, delivered April 11, 1902, in a debate on the election of United States Senators by popular vote. On Thursday, when he emerged from the conference in which Gov. Odell capitulated, he announced:

"It's all settled. Optimism wins. The optimistic man usually gets there, in my experience."

In his willingness to submit his claims to the electorate of New York, Senator Depew gave a touching exhibition of optimism. In looking for a reëlection at his "period of life," he was still more optimistic; and in hoping to succeed against the opposition of Odell he rose to the superlative degree. But his faith, combined with the backing of the New York Central and other corporation interests, has tunnelled, even if it has not removed, mountains.

As to the attitude of Odell there can be no doubt. In his public statement he admits that his "sympathy" was with Black. *Sympathy* is a feeble word. All Odell's intimates, in and out of the delectable Tapeworm Club, were shouting for Black. Congressman Littauer, "Lou" Payn, State Senator Brackett, William L. Ward of Westchester, and William C. Warren of Buffalo were hot partisans of Black. The Troy *Times*, in a leading editorial, explained that Black had really been forced into the field by the importunities of his friends; and the New York *Press*, the chief anti-Platt organ, announced some time ago that the election of Black had been a settled fact for weeks. As late as Thursday morning, the *Press*, to which Gov. Odell ought in decency to have given a quiet tip, gravely reiterated the reasons why the Senator must be Black and not Depew. The Odell faction was thoroughly committed; and yet, before the threatened blow fell, Depew managed to muster enough strength to arrest Odell's mailed fist.

The result must be a deep mortification to the retiring Governor. During his four years as chief executive he has painfully built up a machine— a steam-roller, his detractors call it—that has enabled him to crush his old benefactor Platt, and to claim the succession as boss. Before the moment came for laying down office, Odell's power seemed invincible: he held the Legislature with an iron hand; he controlled the State Conventions of 1902 and 1904. His obvious purpose was to proceed in the exhilarating work and have a United States Senator of his own, some one through whom he could demand a share of the Federal patronage. He went about the task with his usual firmness and confidence. His adherents were so sure of the outcome that they had begun their feasts of celebration, and their brass bands were already playing "See, the Conquering Hero Comes." In this hour of humiliation Senator Depew has tried to save Odell's face by praising his magnanimity and diplomacy. The Senator may even have made concessions on patronage; but the brute fact remains that Odell was, as Speaker Nixon is said to have told him, "up against it." He was forced to back squarely down, while the angry partisans of Black damned him to his face as a "quitter."

The secret of this ignominious retreat may never be fully told. It would be idle to deny that the extended ramifications of the Vanderbilt railroads in business, journalism, and politics have been of vast assistance to Senator Depew. But this aspect of the question is not novel; it is older than many of Senator Depew's most famous jests. The new factor in the reckoning has been Governor-elect Higgins. He more than any other one man is probably responsible for the reëlection of Depew. He has held his own tongue—held it at a time when, to the distinterested observer, utterance would have seemed more courageous and effective. But his judgment

is apparently justified in the event. He promised to be "no man's man," and thus far he has lived up to his word. He has supplanted with an appointee of his own Charles S. Boyd, Gov. Odell's personal friend, the Superintendent of Public Works. As Mr. Boyd, presumably with Odell behind him, wanted to keep the office, which controls an enormous amount of patronage, this change must perceptibly weaken the Odell organization. More significant still was the quiet passing from mouth to mouth of the assurance that Governor Higgins would not let Odell "punish" members of the Legislature who voted for Depew. This, with a number of Senators and Assemblymen, must have been the weight which turned the scales.

Republican newspapers are, of course, shrieking in glad acclaim over the settlement. Governor Odell, Governor-elect Higgins, Senator Platt, Senator Depew, ex-Governor Black, and all the rest are great and good. Never were statesmen more far-sighted, never were they more willing to sacrifice their private ambitions to the welfare of the Grand Old Party on which the salvation of the country depends. Never have New York Republican politicians formed such a happy family; never has harmony been so harmonious. And all this ecstasy because the party boss has failed to have his own way. One is tempted to ask why, when all these blessings flow from a single act of rebellion, the position of boss should not be left unoccupied permanently. Such an arrangement would bewilder many legislators, who would not know how to vote unless they had a boss to tell them; it would disorganize the present scheme of government by which the representatives of the people take all their instructions from a man who is responsible to no one but himself. Yet, revolutionary as the idea is, it might be worth trying—if only as an amusing experiment in political science.

WHERE IMMIGRANTS ARE WANTED

In his administration of the immigration bureau, Commissioner Sargent has lately taken up the plan of diverting the stream of arriving aliens, by some means as yet undiscovered, into the channels where it will do least harm. "Least harm" rather than "most good" has, in fact, been the idea dwelt upon in most of the recent discussion of the immigration problem, both official and otherwise. The problem of relieving the herding of immigrants in large cities, highly important as of course it is, has been approached generally from that side.

Yet while these great cities are concerning themselves over the inundation of unassimilable foreigners, and the manufacturing centres generally are complaining of the danger to the American standard of living, it is interesting to glance at some of the communities which are still anxious for immigration and trying their hardest to get the sort they want. Only a few days ago a plan was set afoot in South Carolina for a general convention of State and Government delegates, railroad officials, and sociologists, to discuss the problem of attracting immigration to the South. The suggestion was made to the South Carolina Immigration Commissioner at a time when that official had just received requests for information from Virginia, North Carolina, and Florida, all of which States were anxious to follow any plan that had proved successful with their neighbor. "I believe," wrote a Northern man interested in the problem, "that such a Congress would attract great attention, and at it there might be solved some of the problems which beset the Government, now that it has entered on a career of reform as to immigration."

The plans which come to South Carolina's Commissioner, Mr. Watson, are varied enough in character. One company is being formed, in Charleston, which proposes to reclaim by drainage thousands of acres of land now unavailable, and settle these new areas as far as possible with Scandinavian immigrants. A former Swedish consul in this country is in charge of the colonizing features of the scheme, but native South Carolinians are behind it, and the Commissioner endorses it. He has recently been asked also to provide a plan for colonizing Russian Jews in the State. While the proposal seems to be only tentative, it has a special interest in that it is an effort to draw southward one of the classes of immigrants most inclined to congestion in the cities.

Mr. S. B. Sargent, who has been connected for twenty years with manufacturing in New England, sends the results of some of his own observations to the Charleston *News and Courier*. Pointing out that Southern cotton manufacturing has heretofore been most successful in the Piedmont section because of the abundance of cheap labor, he calls attention to a gradual change of conditions in this particular, and predicts that when the mills now closed or curtailing their production shall again be run to their full capacity, "the mill managements will then more seriously turn their attention to the problem of securing a portion of the most desirable of the immigrants who are continuously streaming into the northern parts of our country." Continuing, he calls attention to the Portuguese as a most desirable class of labor, both for factory work and for the development of lands for agriculture.

Further south, in Louisiana, the demand for labor is urgent, alike on plantations and on public works. Work is now being done on the levees, for instance, under more than fifty contracts, national, State, and local. Meanwhile, the country negroes have continued to gravitate to the city. When a ship came in a month or two ago at New Orleans with 1,500 Italian immigrants, agents of the contractors competed with planters from inland counties in making terms with them. In all the South, however, the persistent negro question, with the lack of good public schools, is the great deterrent to foreign immigration of the better class, just as slavery was before the war.

"What stronger evidence of the necessity of a board of immigration can be given than can be found right here in St. Paul?" asks a Minnesota legislator who has interested himself in the plan, and proposes to push it again this winter. "Here is an establishment maintained by the Candian Government—suite of offices, a full corps of agents, and an abundance of literature setting forth the advantages Manitoba affords. Every expense is met by the Canadian Government. Is it any wonder that, with such energy on the part of the Canadians, and with inactivity, disinterestedness, and paralysis on our part, they get the settlers and we get few, if any? Ever since the Canadian land boom, Minnesota has seen a stream of desirable settlers actually passing through her territory to settle on lands where, behind the tariff wall, they are lost to our markets." "Heretofore," remarks the St. Paul *Pioneer Press*, "we have depended on the railroads for the advertisement of the opportunities offered by Minnesota and for the personal campaign by which settlers are secured. But the lands of the railroads in Minnesota are dwindling, and their main efforts have for some years been directed to the building up of the population of States farther West. With the Canadian Government, they are strong and enterprising competitors against whom no headway can be made without an organized effort."

These are but a few of the phases of the immigration situation which have became matters of news interest in the past few weeks. The Industrial Commission has recently made a special investigation of the larger aspects of immigration to the South. These latest data represent a side of the problem which is easy to lose sight of in the thickly populated and fully developed States. Dislike of the immigrant in places where he is not wanted, has never been an effective force for making him go elsewhere. But the inducements of places that do want him must be the strongest aids to Mr. Sargent's plan for distribution. Once a respectable number of the arrivals are diverted to the South, for instance, the same desire to follow friends and kindred which has kept the foreigners in

their own "quarters" in the North, should help to keep up the supply.

ECCLESIASTICAL TRIALS.

The Holy Spirit, said John Selden, referring to the complacent *nobis et Spiritu Sancto* of church councils, resides in the odd man—that is, in the man who casts the deciding vote. The generalization is not wholly unfounded. When Benjamin Tredwell Onderdonk, one of the most eminent Episcopalians of his generation, fourth Bishop of New York, was tried for immorality, just sixty years ago this month, he was "suspended from all exercise of his episcopal and ministerial functions" by a vote of nine to eight in the court of bishops. Bishop Ethelbert Talbot of Central Pennsylvania also escaped trial by a vote of five to four in the committee which acted on the first presentment against him in the Irvine case.

The facts in this matter are, briefly, as follows: The Rev. Ingraham N. W. Irvine, D.D., is an Episcopal clergyman who has more than once had disputes over methods of administration with either his parishioners or his bishops. Whether his own infirmities of temper and defects of character or those of his opponents have been at the bottom of these troubles, is hard to determine in the face of conflicting evidence. For example, the statement is made and contradicted that he was once suspended a year for immorality. The probabilities are that he has not been entirely blameless. Five or six years ago, when rector at Huntingdon, Pa., he came into collision with a Mrs. Alexander Elliott, who is described as a woman of wealth, a social leader, prominent in church work, and a friend of Bishop Talbot. She asserted that money which she had contributed to pay a church organist had been misappropriated, and Dr. Irvine denied the charge.

In that juncture his conscience became very tender about Mrs. Elliott's activity in the parish, for she was then living with her fourth husband, and she had, according to current report, divorced at least two of his predecessors. Mr. Elliott also had obtained a divorce from a first wife on the uncanonical ground of desertion. In order to set his mind at rest, Dr. Irvine set forth in a hypothetical case the points in regard to Mrs. Elliott and asked Bishop Talbot for counsel. The bishop replied that the woman was by her own act excommunicate, and advised him to urge her to withdraw without open scandal. But when it turned out that the hypothetical woman was really Bishop Talbot's friend Mrs. Elliott, Dr. Irvine found himself in conflict with his superior, who wanted Mrs. Elliott reinstated. There were charges and counter charges of lying, there was a dismissed accusation of forgery against Dr. Irvine, and the affair was dragged into both the civil and the ecclesiastical courts. Bishop Talbot requested Dr. Irvine to resign, but he refused, and his church stood by him. Finally, Bishop Talbot succeeded in stripping the frock from Dr. Irvine, whom he described as a "slimy fellow." The rector sued for redress in the civil courts, which declined jurisdiction, but which at the same time declared that Bishop Talbot and Mrs. Elliott had "undoubtedly combined to prefer charges against Irvine in the church court," and that "they also hated him."

Through all this tribulation Dr. Irvine was able to retain the sympathy of powerful friends, who carried his plea to the General Convention of the Episcopal Church in San Francisco in 1901. The committee to which the subject was then assigned refused, by a vote of five to four, as related above, to bring Bishop Talbot to trial. The adherents of Dr. Irvine have nevertheless kept up their interest, and have framed a new presentment against Bishop Talbot. This is based upon a letter in which Bishop Talbot accuses Dr. Irvine of being a "plausible romancer," and of being grossly immoral in his relations with women. Bishop Talbot further names eight bishops who will verify these charges; and some of these bishops have insisted that the use of their names is unauthorized. This second presentment will shortly be laid before a committee, or board of inquiry, and that body will decide whether Bishop Talbot shall be tried by his fellow-bishops.

In this procedure popular sympathy will as a matter of course be with Dr. Irvine, not because anybody now has at command the evidence upon which to form a sound judgment, but because the rector appears at first glance to be the under dog. He was, according to his partisans, deposed from the ministry by a tribunal which Bishop Talbot selected, so that Bishop Talbot was practically both judge and accuser. To this theory of persecution the legal processes of the Episcopal Church lend some color; for they assume that the bishop is neutral, or perhaps even anxious to save a rector from disgrace. There is also a widespread distrust of the impartiality of ecclesiastical tribunals. When Charles Kingsley wrote that "truth, for its own sake, had never been a virtue with the Roman Catholic clergy," he expressed a prevalent prejudice against clergymen of all denominations. They are, says the man on the street, more concerned to maintain the dogmas of their sect than to discover and utter the naked truth, more eager to build up the reputation of their denomination, to secure financial aid for it, than to dispense justice in a complicated case. If Dr. Irvine be reinstated, the decision will merely confirm the suspicion that he was outrageously abused; if Bishop Talbot be sustained on a technicality, the comment is likely to be that the Church dared not, for its own fair name, pluck the lawn sleeves from a bishop.

The existence of this prejudice makes an unusual demand upon the courage and candor of the Episcopal authorities. Their conduct must be such as to stop the whispers that High Church or Low Church partisanship has had a preponderant influence, that Dr. Irvine, in spite of grave lapses, has had the thick-and-thin backing of one clerical faction or another. This time at least the facts should be investigated so thoroughly, the trial be so complete and unbiassed, the results so fully published, that no man who will read the evidence can have warrant for talking about a star-chamber verdict.

RED RIBBONS AT COLLEGE.

Foreign travellers have frequently commented on the rather childish joy we Americans take in the great variety of secret and honorary orders. Our millionaires must go abroad for titles and decorations, but our butchers are well supplied with what is technically called "regalia." Even our collegians, who should represent a very democracy of intellect, are subdivided into grades as definite as those which mark off a simple wearer of the red ribbon of the Legion from him whose lapel displays the greater or smaller rosette. Frequently the undergraduate hierarchy is as complex as that suggested by the polychromy of a gowned faculty procession. One has only to recall the senior society system of Yale, the even more intricate ranking of the Harvard Institute of 1770 by "tens," and the mushroom honorary societies that spring up in the smaller New England colleges. The tendency is everywhere well marked.

Naturally, a custom that runs counter to democratic sentiment often meets with opposition. Last week, for example, the *Harvard Crimson*, the official student organ, refused to print the elections to the "Institute of 1770," on the ground that the list is of slight interest as news, and the elections themselves unrepresentative. It may be explained that this ancient sophomore society consists of about a hundred members elected in the following way: Ten freshmen are elected by the outgoing sophomores. This first ten elects a second, and the society is thus recruited by tens until the number is complete. The basis of election is college prominence, athletic, social, or literary; with a leaning to social. Thus, to be in the first ten is satisfactory because it represents the belief of your immediate superiors that you are a man of great prominence. To be in the second ten is also most desirable, because the distinction is conferred by an élite of one's classmates. In general, the early "tens"

bestow an honor like the red ribbon; the later "tens" are consolation prizes like the French *Palmes Académiques*, which we have known to be simultaneously conferred upon an illustrious savant of the Collège de France, and upon a janitor of that venerable institution to celebrate his jubilee of dusting and sweeping. Moreover, the way to all further college honors is, generally speaking, through the Harvard Institute. This body comprises only less than a quarter of an average sophomore class, and in effect its elections are a summary relegation of the remaining three-quarters to collegiate obscurity, if not to outer darkness.

It is easy, then, to understand the opposition to a sophomore pantheon of this sort. Naturally, the earth-dwellers murmur and question the credentials of the happy gods, and the Olympians themselves make tardy and somewhat grudging concessions to the discontent of the mortals. They do well to do so, for at Yale, where the supreme undergraduate distinction was limited to the thirty members of the two senior societies, rival societies have appeared, and already "Bones" and "Keys" have lost much of their pristine glamour. In fact, such perverse conditions as are obtaining in colleges that cling to a ranking system are due less to deliberate intention than to the attempt to put new wine into old skins. College tradition is inveterate. A scheme started in jest among a handful of intimates becomes a law for an undergraduate body of two thousand members. The college caprice of a century ago becomes the college abuse of to-day. It would be interesting to inquire into the singular inflexibility of college customs and organizations. In undergraduate communities are absent most of the events that lend romance to the history of cities or nations. Conscious reform movements rarely are attempted; to conduct a propaganda of any kind is to transgress an unwritten law of good taste; revolutions practically never occur. Custom and precedent are upheld with a fairly superstitious respect. One who really knows undergraduate life might well be inclined to maintain the paradox that youth is really the age of conservatism, and our academies the chief repositories of old and dear abuse.

We judge, then, that such peremptory challenge as the *Crimson* makes of the Institute is not likely to be effective. Indeed, reform of any system of college honorifics is likely to come only through pressing the idea *ad absurdum*. When Harvard has an anti-Institute, and an anti-anti-Institute, possibly the absurdity of the whole matter will begin to appear; and, when the grace of humorous introspection comes to the college body, the descending scale of "tens" will seem little more defensible than the rating of eggs as "good," "fresh," and "extra fresh."

Logic, finally, may some day prevail over most of these little college aristocracies, if only because of the unnecessary duplication of honors they provide. For every specific service to his Alma Mater an ambitious student is appropriately rewarded. If an athlete, he may sport the coveted college initial; if literary, there are editorships within his grasp; if socially acceptable, numerous clubs or fraternities open their doors to him; even scholarship has its emoluments and decorations, and, if Macaulay refused to wear his school medals, his spirit has not entered into the average winner of a Phi Beta Kappa key. In short, it would be difficult to show that genius in college is ever in danger of too little recognition, and we confess that pretty much all the petty pantheons whose membership is so eagerly sought seem to us to fall among the more superfluous branches of the gentle science of honorifics.

BARONESS DU MONTET'S REMINISCENCES—I.

PARIS, December 13, 1904.

Among the minor contributions to the history of our time may be cited the 'Recollections of the Baroness du Montet,' just published. They extend from 1785 to 1866, covering not far from a century. They are published by Count de la Boutetière, who received them from his father, to whom they were left by Madame du Montet. The elder Count was the author of several historical works on Poitou, where he chiefly lived, and La Vendée. He was, during the siege of Paris in 1870, commander of a battalion of the *mobiles* of La Vendée. He was wounded during the battle of Champigny, and died prematurely in 1881 from the consequences of his wounds. He was the nephew of Madame du Montet, and always intended to publish her Recollections, though she said that they deserved to be forgotten "like the dead leaves of the past season."

Marie-Henriette-Radegonde Alexandrine Prévost de la Boutetière de Saint-Mars was born at Luçon on the 30th of January, 1785, of one of the oldest and most distinguished families in La Vendée. Her father was captain of cavalry in the Orleans regiment, and her mother the daughter of the Marquis de la Fare and sister of the Bishop of Nancy, who became during the Revolution the agent of Louis XVIII. at the Court of Vienna, and was, after the Restoration, Archbishop of Sens and cardinal. Alexandrine was six years old when she followed her parents in the emigration. Her mother left Memoirs (published at Angers, in 1844), in which she told the history of the miseries she had to endure in foreign lands. In 1796, thanks to the protection of her uncle, Bishop de la Fare, the Archduchess Marie-Anne, sister of the Emperor Francis II., abbess of the chapter of the Canonesses of Prague, took charge of her education. She was placed in the Convent of the Visitation in Vienna, and remained there several years, during which she became acquainted with the daughters of the best families of the Austrian capital.

In 1801, Alexandrine returned to France with her parents; their castle had been burned, their land had been confiscated and sold. Nine years afterwards, in 1810, she returned to Vienna, to be married there to the Baron du Montet. He was the son of the President of the Parlement of Nancy, and belonged to a family which had always been attached to the House of Lorraine. He left France, still very young, at the time of the emigration, and entered the Austrian army, becoming colonel; but the state of his health obliged him to leave the army, and he was appointed chamberlain to the Emperor of Austria. Madame du Montet found herself quite at home in Vienna. She was appointed lady-in-waiting to the Empress. Her charming manners won all hearts at court. "It was," says her editor, "the most interesting period of her life. Under her eyes took place the most interesting events of an agitated time; she saw many illustrious personages, and her experiences were the source of many interesting recollections. She, however, never forgot France, a country, she said, 'one leaves with pain and to which one returns to die.'" She did return to it in 1824, ten years after the first Restoration, and established herself with her husband at Nancy, the capital of Lorraine. Had she lived in Paris, her reputation would probably soon have become extensive; she was content with her provincial life, and with her Lorraine salon, where she sometimes received a visit from some distinguished traveller. She died in Nancy, on the 16th of January, 1866, at the age of eighty-one years, having seen from her retreat three more revolutions in France—of 1830, of 1840, and the *coup d'état* which paved the way for the Second Empire. Had she lived only four years longer, she would have witnessed the fall of the Second Empire and a fresh invasion of France.

She was occupied during her last years in putting in order what she called "mes petites feuilles délabrées"—a modest expression, which well expresses the character of these "Recollections," for they are not historical pictures and developments, but are essentially anecdotic. Their most interesting passages relate to Napoleon and Marie Louise. In March, 1812, the Emperor and Empress of Austria went to Prague, Teplitz and Dresden, where they saw the Emperor Napoleon. Metternich was with them, and gives in his memoirs an account of the interview which took place between the sovereigns:

"Napoleon received the Emperor at Dresden, at the foot of the stairs; he embraced him, and kissed the hand of the Empress, his mother-in-law. Napoleon sat next to her at table. . . . Marie Louise is not in the poor state which was supposed; she is thinner, but she looks the prettier for it. She gave her mother a gold toilette and twelve gowns—not a majestic present. Napoleon, they say, is of an *humeur massacrante*, except towards the Empress of Austria, whom he finds charming."

In her notes on Dresden, the Baroness says that the King of Prussia had expressed a desire to go to that city, but was told that the interview was to be merely a family affair. There were great fireworks one evening, and in the midst of them appeared an enormous Sun, with the device, "Il [Napoleon] est plus beau et

plus grand que lui." Napoleon said very loudly: "Il faut que ces gens-là me croient bien bête." At a magnificent banquet given by the King of Saxony, Napoleon, finding the repast too long, asked for the dessert. On the King making some apologies to him, he answered by simply asking for the coffee. Napoleon asked Prince Kinsky, who wore the Hungarian costume, "Of what country is your wife?" "Sire, she is of the Empire." "Of what Empire?" "Sire, she comes from Coblentz." "Then say that she is French."

There was much talk at Dresden of a proclamation which Napoleon was to make to his army, announcing that he would be on the 15th of July in Saint Petersburg. There, he said, he would fix limits to the Empire of Russia. "Marie Louise," writes Mme. du Montet, "wept much over the departure of Napoleon. She is now at Prague. She loves him very frankly. She is singularly beautified, and is now very elegant, and consequently hardly recognizable." Mme. de Staël was in Vienna at the time, not at all pleased with the little enthusiasm shown towards her. "Many things are said; there is talk of a *grossesse*, of a certain M. de Rocca, of a secret marriage." We have a curious extract from a letter written by Baron du Montet to his wife after a visit paid him by Mme. de Staël:

"Mme. de Staël has come and gone. . . . Our first interview with her was a tête-à-tête. I sat next to her on a sofa. The conversation became interesting for what she put in it; as for myself, I fell into my distraction, so that I know only half the beautiful things she told me. Poor Alexandrine, how I pity you! Mme. de Staël is convinced that your husband is but a fool. . . . She seemed to say to me that she was persecuted because she would not burn incense to King Napoleon. I answered, without thinking: 'So there are but three independent Powers in the world—England, Russia, and you.' . . . I thought that I had said a foolish thing. Not at all; my answer was thought original and witty, and she pressed my hand with emotion."

He speaks afterwards of the Chevalier de Rocca, "whom Madame de Staël treats like an obedient son rather than as a lover, and who is nothing extraordinary."

We find a few details regarding the famous Queen Caroline of Naples, who died on the 8th of September, 1814, at the castle of Hetzendorf. The Empress Marie Louise, who retired to Austria after the fall of Napoleon, often saw the Queen, who was her grandmother. She brought to her her son, the little Napoleon (the "Aiglon"). Queen Caroline never called him otherwise than "Mon petit Monsieur"; when she heard of the marriage of the Archduchess with Napoleon, she said: "Nothing was wanting in the list of my misfortunes but to become the grandmother of the devil." Speaking of Napoleon, she used to say: "Hell is in his heart, and chaos in his head."

Madame du Montet was at Vienna during the famous Congress of 1814. Immense preparations were made to receive the sovereigns. Feasts were given every day; the Prince de Ligne called the congress *un congrès dansant*. There are long and rather amusing descriptions of the balls given for the sovereigns, Madame du Montet, though her lot had been cast away from France, remained a Frenchwoman at heart, as is well shown by a few lines she writes at the time of the entrance of the Allies into Paris: "There," she writes, "is a letter which has thrown my pride as a Frenchwoman into despair. I am furious; all the more so because this letter tells the truth." It was a letter written by a Frenchman, in the service of Austria, M. de Lort, a friend and comrade of M. du Montet, and describes the state of Paris in 1814.

"The men, who are always the same, have never so signally manifested as now the neutrality of their selfishness. Marshals, ministers, senators, courtiers are hastening to abandon their idol. . . . Gold was never more abundant in Paris than at present; millions of gulden circulate every day; the shops are emptied. . . . The Allies glory in their victory; the French marshals and the Senate thank God for their own defeat; epidemic outbursts, general joy, drown the sighs of a few familiars of Napoleon; the women especially, in their joy, electrify by the spontaneous expression of their royalism; the Emperor Alexander gives fraternal kisses to marshals and senators."

This letter from an *émigré*, written after a grand review in the square where Louis XVI. had been executed, reminded me of the lines of Jules Barbier:

"J'ai vu nos femmes, belles d'impudeur,
Aux regards du Cosaque étaler leur poitrines
Et s'enivrer de son odeur. . . ."

To do justice to Madame du Montet, though she kept this letter, she did not wholly share the sentiments of the writer, while unable to disagree with the last sentiment expressed: "All this inspires me with an ironical contempt for *Messieurs les Sénateurs*, who, under the new Constitution, have, with paternal care, assured the fate of their dear posterity at the expense of the posterity of others."

Correspondence.

THE CRUSADE AGAINST BORAX.

To the Editor of The Nation:

Sir: In your valuable issue of December 15, 1904, you have an article headed "The Pursuit of Pure Food." It is certainly alarming to the public at large to read the sensational reports of the detrimental effects of one-half gramme of borax on the human system. Dr. Wiley made his experiments for a period of fifty days, and considered it a very severe test. He well knows that England has been consuming boraxed foods for a quarter of a century, and she partakes of boraxed foods daily. She does not have periods of rest to recuperate from the evil effects of borax on the system, because no ill effects are noted. If Dr. Wiley's conclusions are logical, why are not the same symptoms he describes visible in the English nation? Dr. Wiley could not have fed his "poison squad" on nice, fresh, sweet quail for thirty days without detrimental results. Dr. Wiley had the same menu for all his boarders, which is not logical. His method of administering borax or boracic acid in capsules was not logical.

I was recently in Washington, and I visited the Bureau of Chemistry building and saw the dining-room where Dr. Wiley is making his experiments, and I can assure you the conditions and surroundings in the dining-room, hall and kitchen would certainly conduce to deprive a normal human being of his appetite, and the odors of chemicals, oils and gas would cause a dull headache and a nauseating feeling. It certainly is not to Dr. Wiley's credit to conduct scientific experiments in such an unscientific manner. If funds are not available to furnish clean, hygienic quarters for a kitchen and dining-room, I would suggest that a tent be used for the purpose. A tent would certainly be free from obnoxious odors, and a nice green grass floor would be cleaner and more healthful than a soiled cement floor.

Borax and boracic acid are the mildest antiseptics known, and if Dr. Wiley condemns them, what substitute has he to offer? Under existing circumstances, it is absolutely essential to use some method for preserving perishable articles of food. England was forced to use some preservative, and, after a most searching investigation, she learned that borax and boracic acid were the best preservatives she could employ to have her meats and butter arrive in a sweet, healthful and palatable condition. I presume the Englishman takes more borax into his system in a fortnight than Dr. Wiley's boarders did in their fifty-day siege. Nevertheless, the English nation is recognized as one of the most healthful nations on the face of the globe. With these facts before us, how can we consider the result of Dr. Wiley's experiment logical?

I most heartily approve of labelling all articles of food, said label to show amount and kind of preservative used, thus acquainting the purchaser with the nature of the articles purchased, and letting the consumer learn from experience (as the English nation has learned) the value and innocence of borax and boracic acid as a mild, excellent, wholesome preservative.

Yours very truly, H. H. Langdon.

427 W. 22d St., New York, December 29, 1904.

AMERICAN PRICES FOR ENGLISH BOOKS.

To the Editor of The Nation:

Sir: The price charged by the American publishers for the third volume of Saintsbury's 'History of Criticism' ("printed by William Blackwood & Sons, Edinburgh, Scotland") does not sustain Mr. Howells's contention, in the Easy Chair of the December *Harper's*, that we are to-day paying much more for our English books than we should be but for the existence of the international copyright law. The American publishers mail the volume in question for $3.70 net. The price of the book in England is twenty shillings net, which, with the added postage, makes the book cost an English purchaser fully $1.25 more than he would have to pay if he imported the book from America. All of which is pleasant enough for us, but likely to be, I should think, a bit irritating to the English book-buyer. D. M.

Notes.

Further announcements from Macmillan Co. are the first volume of Prof. Edward Channing's 'History of the United States,' to make eight in all; 'Western Europe in the Fifth Century,' by the late Edward A. Freeman; 'An Unwritten Chapter in the History of Education,' viz., of the Society for the Education of the Poor in Ireland, 1811-1831, by Dr. H. Kingswell Moore of Bal-

liol; 'Progress and the Fiscal Problem,' by Thomas Kirkup; 'Sir Walter Raleigh,' by Sir Rennell Rod; a 'Pocket Biography of Shakspere,' by Alfred Ewen; 'Franz Hals,' by Gerald S. Davies; and 'The Cathedral Church of St. Asaph,' by P. B. Ironside Bax.

'Legends and Tales,' of Jewish interest, compiled by Isabel B. Cohen, will be published this month by the Jewish Publication Society of America.

The present month will also witness the bringing out by the University Press of a facsimile of the autograph MS. of Keats's 'Hyperion,' in an edition limited to 195 copies. This manuscript belonged to the late Lord Houghton, and contains twenty-one hitherto unpublished lines.

Simultaneously with the completion of the fund commemorative of the late Sir Leslie Stephen (amounting to nearly $4,000, employed partly in producing a large photogravure of Watts's portrait of Stephen, and the remainder in founding a lectureship in literature at Cambridge bearing his name), Messrs. Putnam bring out a first instalment of the author's own monument—to wit, his Essays, Literary and Critical. The 'Hours in a Library,' in four volumes, makes this group; to be followed early in the present year by the Essays on Free Thinking and Plain Speaking, and later by still others. We need not review again the 'Hours in a Library.' Their present form is elegant, yet simple, and the page very legible. Amid the various periods and nationalities surveyed by Stephen in this series, we may remind our readers that the two American writers considered are Jonathan Edwards and Hawthorne. Few essays can be more profitably kept at one's elbow, or give greater intellectual pleasure.

The current *Critic* makes formal announcement of its having absorbed the *Literary World* of Boston, a journal exclusively literary, which underwent many vicissitudes of editing and publishing in its three decades of existence.

From Lemcke & Buechner we receive the two annuals whose eclipse would darken any New Year—*Minerva* and the *Almanach de Gotha*. *Minerva* presents anew the result of an endeavor to satisfy the learned world whose personnel it records, while not exceeding the bounds of expense and of bulkiness. Minor institutions whose relation to mankind at large is relatively unimportant have been dropped in favor of new ones of dignity and promise. A few names are thus erased from the Register, which is the crowning utility of this invaluable year-book. *Minerva's* portrait this year is of the genial, German-looking Pietro Blaserna, director of the Physical Institute in Rome, and president of the Royal Accademia dei Lincei. His graduating thesis at the University of Vienna was, indeed, in German. This veteran physicist and author is now in his sixty-ninth year.

The *Almanach's* frontispiece for its 142d issue is a portrait of Caroline, the Grand Duchess of Saxony; the Grand Duke's follows, and the regulation third and fourth are of Frederick, Prince of Solms-Baruth, and of Count Lamsdorff, Russia's Minister of Foreign Affairs. In attempting to record the respective armaments of the two great Powers at war in the Far East, the editor says that Russia has given information freely, as heretofore, but it cannot be trusted on account of the changes caused by the campaign, while Japan on her part declines all information. The lost ships are marked with an obelisk. Other editorial difficulties have grown out of extraordinary changes in the personnel of Cabinets and diplomacy, and of increasing demands on space, some omitted features having had to be restored in consequence of reclamations.

Two other annuals of great utility reach us from London, 'Whitaker's Almanack for 1905' (thirty-seventh year) and 'Whitaker's Peerage.' Both exhibit new wrinkles, and both retrench. Pertinent to present economic discussion in Great Britain is the Almanack's section displaying the Movement of British Commerce in 1904. The Peerage now claims for itself a high degree of authority for the proper "designations and styles of the relatives of Peers." The note on the colonial use of the term "Honorable" has been revised and made more definite.

The Iliad in a nutshell, and Boswell's Life of Johnson in one volume—a miracle of compactness, achieved by the Oxford University Press (H. Frowde) by printing its two-volume edition of 680+744 pages on its famous thin paper, so that one may carry the book with ease in his coat-pocket, and, what is more, enjoy a letterpress fit for aging eyes. There are two portraits of Dr. Johnson, and an index of 45 pages.

A like compression has been similarly effected in George Newnes's 'Journal to Stella, together with Other Writings relating to Stella and Vanessa' (Scribners). Here we have, in a thin oblong book with flexible covers, 713 pages packed away, index included, of very fair type, with a portrait of Swift and an ornate title-page. Prettier still, partly because of a thicker, more opaque, paper, and marked by the same accessories, is 'Early Italian Poets from Ciullo D'Alcamo to Dante Alighieri (1100-1200-1300) in the original metres, together with Dante's Vita Nuova, Translated by D. G. Rossetti' (Newnes-Scribner). This is a delightful reprint of a classic.

We have spoken often in praise of the meritorious reprint of the First Folio of Shakspere carried through in a scholarly manner by Charlotte Porter and Helen A. Clarke (Crowell). The latest to appear in the handy series is "Julius Cæsar," with the customary apparatus of introduction, notes, glossary, variant readings, and selected criticism.

In one of his letters to Mathilde Wesendonck, Richard Wagner describes eloquently the difficulty he and his French assistant experienced in translating his "Tannhäuser" poem into another language. "Parsifal" is more difficult than that early work. Several attempts to give its equivalent in English have been made, some of them with considerable success; but the latest surpasses all the others in combining fidelity to the text with good English and intelligibleness. It is by George Turner Phelps of Harvard, and makes a volume of eighty-five pages of German text and the same number of English pages (Richard G. Badger). The insertion between the lines of the poem of indications as to orchestral interludes ("orchestra, three bars," "orchestra, nine bars") seems somewhat whimsical, although the translator gives his reason for it: "In order to suggest the elaborate fulness of the orchestral score, and to prevent the impression of the drama as being a simple tale, quickly told, and easily slipped over in a casual half-hour, the more important shorter breaks are included," etc. There are a few misprints, and in the preface the word "orchestration" occurs in an unusual sense; but in all essential matters Mr. Phelps's little volume is excellent; it should be in the collection of every Wagner lover. He has evidently no sympathy with those who hold that "Parsifal" reveals Wagner's declining powers; to him it is "the product of a mind gifted with marvellous creative imagination."

Two other recent little books on "Parsifal" call for brief mention—'The Legends of Parsifal,' by Mary Hanford Ford (H. M. Caldwell Co.), and 'Parsifal, Lohengrin, and the Holy Grail,' by Alice Leighton Cleather and Basil Crump (G. Schirmer). The first of these tells the story of the opera and compares it with its sources; the second brings together two of Wagner's works which, though chronologically separated by more than thirty years, have their common basis in the legend of the Holy Grail. Much interesting matter relating to the two operas is contained in this book; among other things a photographic facsimile of the end of a letter in which Wagner signs himself as "Your grateful Buddhist" ("Ihr dankbarer Buddhist"). Wagner's library contained all the sacred books of the East; as regards his scholarship in general, we are told that "a historian might have selected those books on ancient national customs, a philologist those on myths and saga, a sculptor or architect those on the plastic arts, and a poet that treasury of epics and dramas."

Since photography and process work have enabled publishers to bring out illustrated books at relatively modest prices, it must have occurred to more than one sincere person that the great demand for art books was due much more to an interest in the reproductions than in the text they embellished. As these texts have too often been not only dull and unreadable, but ignorant or misinformed, the same sincere person wished them abolished or at least curtailed, and their places taken by more illustrations. It was sure to come to this, and in the English series of "Newnes's Art Library," and in the far superior German "Klassiker der Kunst," we have in each volume a large number of reproductions of our great masters' works, prefaced by a brief introduction, and followed by a summary catalogue. They are very good for the money, and very convenient. For the last volume in the English series, on Benozzo Gozzoli, we should have nothing but praise if both introduction and catalogue were omitted, and if some pictures had not slipped in which have no relation to the subject.

The American Folk Lore Society have published through Houghton, Mifflin & Co. 'Traditions of the Skidi Pawnee,' by George A. Dorsey, curator of the department of anthropology in the Field Columbian Museum. The collection of these traditions was carried on for nearly four years, first under a special grant made by the Museum, and later with funds provided by the Carnegie Institution of Washington. The Pawnee, according to Powell's classification, are a group of the Caddoan linguistic stock, and the Skidi are closely related to the Arikara. From the beginning of their history until a recent date the Pawnee have been a people of the great plains, dwelling

in buffalo-hide tipis, or in earth lodges of the type which studies of the Mandan and Arikara have made familiar. As a plains people they were largely dependent upon the chase, but gave also considerable time to agriculture. The social organization was based upon the village. No trace of the clan has been found. In religion they reached the highest development of any of the plains tribes, and their ritual was elaborate, "a star cult of the very highest order." It will be seen that here is offered a most valuable field for investigation, and the work has been well and thoroughly done. The book is a very important contribution to American folk lore. Included in the volume are a number of "Coyote Tales." Coyote was as clever as Brer Rabbit.

The Fulani, the ruling race in Northern Nigeria, are the subject of a suggestive article in the *Geographical Journal* for December, by Major Burdon, Resident of the Sokoto Province. Simple shepherds a century ago, they have developed, through their responsibilities as rulers, into a people who in some respects excel all other Africans. A striking characteristic is "the very deep-rooted desire for constitutional government. The emirs are elected by the will of the people as voiced by the Council of Elders, and this council must be consulted by them in their public acts." The method of appointment to office is interesting. A man's name is suggested, and the emir "promises it his favorable consideration, allows this fact to be published, and then waits for a month or so to see whether the proposal is acceptable to the people. If no notice is taken of the suggested promotion, the matter is dropped as unpopular. But if congratulations pour in, and the officer-elect begins to be universally addressed by the new rank which is promised him, it is a certain sign that the appointment meets with approval, and it is then carried into effect. . . . Through these Councils of Princes the future emir enters the service of the State, climbing the ladder of promotion by force of character, wealth, and public service till he reaches, at a ripe age, the position of heir apparent, from which he succeeds by right to the emirate." The aim of their English overlords is to "make of these born rulers a high type of British official, working for the good of their subjects in accordance with the ideals of the British Empire, but carrying on all that is best in the constitution they have evolved for themselves, the one best understood by, and therefore best suited to, the people." The occupation of the country by Great Britain has been too recent to permit of any definite statement as to the attitude of the native towards the foreigner. Among hopeful signs, however, is this incident: "A little while ago, in a town where less than a year before men had died happy cursing us as infidels, the Resident lay dangerously ill. He was publicly prayed for throughout the mosques." Dr. H. R. Mill describes the physical features of England and Wales as an accompaniment to a surface-relief map on which there is a new nomenclature adopted by the Royal Geographical Society for the larger features.

Petermann's Mitteilungen, number ten, contains a description of the physical features and geology of the Karadagh on the northern frontier of Persia. It is a summary of the results obtained from the explorations of some Russian mining engineers who had secured from the Persian Government a concession for exploiting the mineral wealth of the region. Professor Lendenfeld treats of the ancient glaciation of the Australian Alps, appending to his article a bibliography of the literature of the subject.

The proposal to make a Jewish settlement in East Africa seems likely to be realized. At a meeting of "Friends of Jewish Freedom," recently held in London, Sir Harry Johnston, who was originally opposed to the scheme, declared himself in favor of it as now practicable. He described the land offered as about equal in area to Wales, covered with rich alluvial soil, well watered, with a climate "near perfection," and practically uninhabited. The Uganda Railway passes within twenty or thirty miles of part of the territory. It is proposed that, if the colony is established, it shall be constituted as a separate province of British East Africa, administered locally by a Jewish governor. Three commissioners have gone to visit the region, and are expected to report to the next Zionist Congress.

The longest Neo-Punic inscription extant has lately been found by M. de Mathuisieulx in Tripolis. It is finely made and well preserved. According to its text, a temple of Ammon stood at the place where it was found, and this is a votive inscription. Fortunately, there can be no doubt as to the date, namely, 15 or 16 A. D., and the find is probably the most valuable ever made for the history of the Punic language.

Of the Archæological Atlas of Algeria which is being published with the assistance of the French Cultus Ministry by Stéphane Gsell and a large corps of specialists, the two first *fasciculi*, consisting of sixteen sheets, have just made their appearance. The Atlas is based on the chart published by the Service Géographique de l'Armée, on the scale of 1:200,000. This will give a total of fifty-one sheets. All historic localities, remnants of walls, roads, names, etc., are marked in red. Each sheet is accompanied by a detailed descriptive text, in which special prominence is given to old and modern geography. In the case of the leading ruins, plans on a larger scale are furnished, with full data concerning the inscriptions found there and the distribution of troops.

In connection with the University of Berlin, a special seminary for East-European history and kindred subjects (*Landeskunde*) has just been established. For the present season four special courses are announced; one, by the director, Professor Schiemann, on Russo-English Treaties; another, by Professor Schalfejin, on the Russian language; a third, by Professor Kretschmer, on the Historical Geography of the South European Peninsula; and a fourth, by Dr. Ballod, on Russian Finances and Trade.

The Massachusetts Civil-Service Reform Auxiliary renews its offer to furnish free of all expense pamphlets on civil-service reform to all high schools, normal schools, and colleges willing to make these pamphlets the subject of a lesson in their Civics course. During the past three years more than 70,000 of the pamphlets have been distributed to about 1,000 schools and colleges scattered throughout every State and Territory of the United States. Copies of 'The Merit System—The Spoils System,' by Edward Cary, and 'The Merit System in Municipalities,' by Clinton Rogers Woodruff, together with other of the Auxiliary's publications, may be obtained free on application to the Assistant Secretary, Miss Marian C. Nichols, 55 Mount Vernon Street, Boston, Mass.

—Mr. Frank A. Vanderlip, in *Scribner's* for January, begins his series of papers on political problems of Europe as they interest Americans. Assuming the commercial point of view as the most important, he devotes his first paper largely to a consideration of the chances for stability in the existing European governments, since commercial development, and consequent ability to compete with American products, depend largely upon political stability. His general conclusion is that for many years to come the present situation will remain practically undisturbed. The death of the present ruler will not disrupt even the badly coherent empire of Austria-Hungary, since conditions are not such as to lead any other Power to desire its territory. Mr. Vanderlip recognizes the immense burden of the present military system of the European Powers, and finds no reason whatever to hope for any lessening of the burden, but still thinks that in some way it will be carried without political disaster. He does not consider the arbitration movement as of sufficient power to restrain any ruler or people that really wishes to fight; and still less can it originate an effective movement towards disarmament. Continental European parliaments he regards as practically a failure, and the constant ferment in which they are kept by questions of the relations of Church and State should lead us to look with some complaisance, he thinks, upon the charge that we are a nation of dollar-worshippers, concerning ourselves with only such political questions as affect our pocketbooks. Thomas F. Millard writes of some of the lessons on the conduct of war to be derived from the present conflict between Japan and Russia. He finds no encouragement for those who have been hoping for a mitigation of the evils of war from the very deadliness of its modern appliances. Troops will endure a certain amount of carnage before they will give up the conflict, no matter how or under what conditions that carnage is produced. In changing its methods, war has not changed its real nature, its objects, or its results.

—The hopeful feeling with regard to the future of Austria-Hungary which Mr. Vanderlip expresses in *Scribner's* is not apparent in the paragraph which Andrew D. White devotes to "the sorrows of Francis Joseph," in his diplomatic reminiscences in the *Century*. "His empire," says this writer, "which is a seething caldron of hates, racial, religious, political, and local, is held together by love and respect for him; but, when he dies, this personal tie which unites all these different races, parties, and localities will disappear, and in place of it will come the man who by force of untoward circumstances is to be his successor, and this is anything but a pleasing prospect to an Austro-Hungarian, or indeed to any thoughtful observer of human affairs." Mr. White's reminiscences are very sugges-

tive reading to any one who takes a reflective interest in our relations with other lands. Randall Blackshaw's paper on "London in Transformation" is another reminder of how rapidly old things are passing away under the spirit of the present age. The renaissance of energy has taken root even on such stony ground as Spain, as we learn incidentally from a brief paper in the same number by Christian Brinton, on Zuloaga, the Spanish painter. "The Spain of to-day is a vigorous, progressive nation, which is rapidly advancing politically, commercially, and æsthetically." Zuloaga, as Mr. Brinton sketches him, would make a fine subject for romance—the restless and discontented boy, put unsuccessfully to one occupation after another by his family; so discouraged by his first attempts to secure recognition as an artist that he throws it all up and enters the bull-ring, triumphant over eighteen bulls, only to be gored back to the brush and canvas again by the superior strength of the nineteenth; finally to win world-wide recognition as one of the great artists of his time. An "open letter" calls attention to Sainte-Beuve's engagement in 1869 as an occasional contributor to the *Evening Post*, and includes Sainte-Beuve's letter to Mr. John Bigelow regretting his inability, from lack of time and strength, to continue the contributions.

—Professor Münsterberg's German book has been done into English by Dr. Edwin B. Holt, his assistant in the Harvard Psychological Laboratory, and makes a handsome volume which is a credit to its publishers ('The Americans,' McClure, Phillips & Co.). The original work was reviewed at length in these columns, so that all that now remains to be done is to speak of the merits of the translation. While the book is easily readable, being written in a fluent style and betraying little of the awkwardness which attaches to so many translations and at once betrays them as such, a cursory examination of passages taken at random reveals not a few infidelities, inaccuracies and ineptitudes. In some places the translator does not quite correctly reproduce the original, and in others he unnecessarily adds to it. Where the author says that the "American yields to inconvenient social requirements," the translator says he "lends himself to social situations which are otherwise inconvenient"; where the author speaks of amiability (*Liebenswürdigkeit*), the translator renders it "good-nature." The translator, again, speaks of the American Constitution as having "given the American body politic its *remarkable and* permanent" form, and of the "events which to-day arouse the *keenest* public interest"; in both of these cases the words we have italicized are absent from the original. It is often necessary in a version to transpose words in order to avoid ambiguity or an unidiomatic construction; the present translator does this where there is no reason and no necessity for it, and where it actually weakens the phrase. An instance in point is Dr. Holt's speaking of American ambition being directed toward "athletic virtuosity and wealth," while in the original the word "wealth" comes first, in conformity with the elementary rule, followed unconsciously by men who have the literary instinct, that of two nouns, one qualified by an adjective and the other not, the latter should, if possible, come first. Again, in speaking of the decline of the theological predominance, Professor Münsterberg says: "*As late* as 1790, 150 of the 350 pages of the book-catalogue of Harvard College were filled with theological books. *To-day* Harvard has nearly a million of books, the greater part of which belong to the domain of literature, history, philology, philosophy and jurisprudence." This is what his translator represents him as saying: "*As early* as 1790 the catalogue of Harvard College contained 350 pages, of which 150 were taken up by theological works. Harvard has to-day almost a million books, mostly in the department of, etc." Aside from infelicities of rendering there are occasional inelegancies, or, to speak more precisely, grammatical slips, as when we are told that "*the demand* for shorter hours and higher wages *were* the main issues."

—Among "distinctive features" of the Cambridge Edition of Wordsworth, just issued by Houghton, Mifflin & Co., Prof. A. J. George proposes the following desiderata (p. v.): "the latest text adopted by the poet"; "the chronological order of the poems"; "the date of composition and that of publication of each poem"; and a "bibliography of Wordsworth's works." In reproducing Wordsworth's text, aside from an occasional lapse from his use of capital letters, the publishers have succeeded well; in preparing it, the editor has evidently neglected the well-known textual criticism by Mr. Hutchinson in his preface to the Oxford Edition. In attempting a chronological arrangement of the poems, more than once Mr. George has slipped obviously. For example, he inherits (p. 70) a traditional misplacing of "The Birth of Love" (? 1795), allowing "The Reverie of Poor Susan" (1797) to precede it, as in the Globe Edition (p. 72); similarly, with the poems of 1811 he includes (pp. 399, 400), as does the Globe Edition (pp. 404, 405), two "Inscriptions" improperly dated 1808. In assigning dates of composition and first publication, Mr. George has fared ill. Following his records simply up to the year 1826, we find fifty-nine cases of agreement with faulty dates in the Globe Edition, which derives, of course, from the Edinburgh; we may wonder wherein the editor's acknowledged debt (p. vi.) to more trustworthy sources consists. A proper use of Mr. Hutchinson's Oxford Edition—not to speak of his article in the *Academy* for August 26, 1893—might have spared the sponsors of the Cambridge Edition some post-mortem regrets. In compiling his Bibliography, Mr. George has omitted not merely Mr. Hutchinson's reprint of 'Lyrical Ballads,' but even Professor Knight's indispensable Eversley Wordsworth. No excellence of type, inclusion of supplementary material like that in the Globe Edition, or of miscellaneous Notes from all quarters, whether properly supplied with quotation-marks and references or not—not even the presence of "The Recluse," hitherto guarded by a Macmillan copyright—can atone for such evidences of editorial incompetence, which might be multiplied.

—Two new periodicals in the field of Celtic philology have made their appearance within the year just closed—the *Celtic Review*, to be published quarterly in Edinburgh, and *Eriu*, of which two numbers a year are to be issued by the School of Irish Learning in Dublin. The Scottish Gaels, though they have maintained their language in literary use and produced such eminent Gaelic scholars and writers as Campbell of Islay and Alexander Cameron in the last generation, or Dr. Macbain and Mr. Carmichael in the present, have nevertheless borne a comparatively small part in the recent revival of Celtic studies. It is the object of the new review to stimulate them to greater productivity. The editors are Professor Mackinnon and Miss E. C. Carmichael, and the first number contained articles by English, Irish, and Continental scholars, as well as by the Gaels of Scotland, who are likely hereafter to be the chief contributors. The programme of the review provides for essays and notes upon all subjects of Celtic interest, philological, literary, or historical, and we judge from the first two numbers that popular articles will be admitted as well as those which are severely scientific. An important part of the work will be the publication of inedited Gaelic manuscripts, of which many are preserved in Scotland; and Professor Mackinnon has begun with an edition of the story of Deirdre from the Glenmasan Manuscript in the Advocates' Library.

—*Eriu* is edited by Profs. Kuno Meyer and John Strachan, the directors of the newly established School of Irish Learning in Dublin. They also announce as one of their chief objects the publication of texts, and it is hoped that the Dublin school will train a good number of competent editors. The Irish libraries (particularly those of Trinity College and of the Royal Irish Academy) possess a great quantity of manuscript material in the Irish language, and much of this is not only inedited, but very imperfectly catalogued. A group of young scholars working every summer under the direction of such expert Celticists as Professors Meyer and Strachan ought to be able to make rapid inroads on these collections, and to render thereby considerable service to both literary and historical studies. The work of the school, as we understand it, will bear somewhat the same relation to regular university teaching in Celtic that the work of the archæological schools in Athens and Rome bears to the classical instruction of the universities. The directors, who are themselves professors in English universities, do not undertake to supply the entire training of a Celtic philologist, though they offer vacation courses in Irish grammar and literature. But while they do not duplicate the work of the universities, they supplement it most effectively by placing the materials of research in the hands of men already possessed of some special knowledge and training, and by guiding them in their investigations. Students of this sort will be able to make best use of the opportunities offered by the School. At the same time the directors mean to bring together native Irish speakers, and turn their knowledge to account. Some of these can be trained to become competent copyists or editors of modern manuscripts, and others will undoubtedly be encouraged to acquire the more complete equipment of the philologist. The School has already selected one man of spe-

cial promise, and sent him to study on the Continent. The friendly coöperation of trained scholars with native speakers is one of the best features of the undertaking. In view of this and of the abundant material for research accessible in Dublin, the new foundation ought to prove an important event in the history of Celtic studies. The first number of *Eriu* is of a character to confirm our hopes and strengthen our interest in the School. It contains a series of excellent articles (chiefly editions of texts), contributed by both directors and students, and representing all the periods of Irish literature. We may add, also, that it was to meet the exigencies of instruction in the School that Professor Strachan recently published his 'Selections from the Old Irish Glosses,' the only Old Irish reading-book at all adequate to the present needs of students beginning the subject.

LANG'S HISTORY OF SCOTLAND.

A History of Scotland from the Roman Occupation. By Andrew Lang. Vol. III. London: William Blackwood & Sons; New York: Dodd, Mead & Co. 1904.

This History of Scotland is an interesting illustration of the change that has come over the manner of writing history—an illustration the more interesting in respect of the character and gifts of the author of the book. Mr. Andrew Lang is a literary man of high, and deservedly high, reputation. He is a poet, whose verses have indeed been few, but have been good, with the true spirit and touch of poetry in them. He has also written an historical romance, and has in his more elaborate treatises on myths and folk-lore shown himself a scholar and inquirer of a high order. No man might have been deemed more likely to write history in a romantic spirit, to tell his tale with dramatic skill, to lavish upon the striking situations and brilliant personalities which Scottish history presents all the resources of his literary art. But the tendencies of our time have been too much for him. His labor has been given to the collation of authorities and the ascertainment of facts. He marshals and examines the divergent or contradictory statements of contemporary writers; he engages in arguments with other recent historians; he seems to take no pains to please the reader by any highly finished passages either of picturesque description or of philosophical reflection. Indeed, he takes little or no thought about style, but simply jots down the facts in a succession of short sentences. He is sometimes arid and precise enough to satisfy the soul of a German Dryasdust, or of the Cambridge professor who maintained that history, if it was to be good, must begin by being dull. The modern passion for scrutinizing all the sources and presenting their results in the most plain and summary fashion has seized and carried away this accomplished man of letters.

For the pains he has taken, the utmost credit is due to him. Whether he is always, or even usually, right or not, no one can pronounce without following his steps through the dreary labyrinth of the often obscure and almost always prejudiced and partisan authorities whom he quotes. With his general views of the period many students will not agree. We personally think him quite wrong, though we cannot argue the matter within the limits of an article. But all must recognize his diligence and his acuteness. He loves a riddle, and throws himself eagerly into the effort to solve it. Though in this volume he encounters no mysteries quite so perplexing as the Gowrie conspiracy or as some episodes in the life of Queen Mary of Scotland, there are here, too, some problems, such as the so-called Incident that befel Charles I., worthy of his labors and his ingenuity; and he has thrown a light upon them from which every successor will draw benefit.

The chief blemish of the book is the spirit in which it is written. A contemporary historian is almost inevitably influenced by the sentiments of his sect or his party, or by his personal likings and aversions. No one expects impartiality from such writers as Clarendon or Burnet. Mr. Bancroft did not attain it; still less did the earlier historians of the American Revolution. Mr. Lecky, who was eminently fair when he dealt with the history of Ireland in the seventeenth century, became a partisan when he touched the nineteenth. We might have expected Mr. Lang, in dealing with men and events that lie two centuries and a half behind him, to show that calmness and detachment which befit the philosophic historian. But he writes about the Presbyterians of Scotland in the days of the Stuart kings with an unceasing bitterness which becomes positively wearisome. This volume is one long-drawn-out gibe or sneer at their folly or their hypocrisy; the clergy being, of course, the chief victims of his satire. Let us for the sake of argument assume them to have been stupid, ignorant, cruel, arrogant, bigoted; their Covenant to have been, as Mr. Lang represents it, a grotesque conceit; their political notions fit for Bedlam; and if this be so, let Mr. Lang say it once for all, and thereafter consider it to be taken as part of the situation. It is the iteration and reiteration of petty pin-pricks, the unending process of that sort of scolding which is called in Scotland "girding," the constant ironical use of phrases like "the godly," "the pious," etc., that fatigue a reader who may or may not deem the objects of Mr. Lang's sarcastic fleering to be just as unwise as Mr. Lang does, but who realizes that as nearly all men in the seventeenth century had notions about politics and religion entirely unlike ours, there is no use in perpetually insisting on the absurd results of those notions. One of the consequences of this way of treating the leaders and the ideas of the time is that we lose the perspective of events and tendencies, and are helped but little to understand what was really passing.

In the sixteenth and seventeenth centuries other people as well as the Covenanters did strong things, inconsistent with their Christian professions. A Pope gave thanks for the massacre of St. Bartholomew. Good men conspired to murder the enemies of their Church. But Ranke does not think it necessary to be always reminding his readers that the conduct of the Popes was not quite what we should now expect from the Vicar of Christ. In one place (p. 285) Mr. Lang says, "We must try to display the serene calm of history." He seems, however, to have been goaded out of that serene calm by reading one or two recent Scotch books in which the Covenanters have apparently been depicted as patriots and martyrs; and, in seeking to redress the balance, he forgets to give us that fair and penetrating view of the whole position, and of the circumstances which drove to excesses a people not specially fierce or fantastic, which we look for from a writer of his knowledge and his capacity.

However treated, the history of Scotland for nearly a century after her native king went to reside in the far larger and wealthier realm which passed to the Stuarts on the death of Elizabeth, is a dismal story. Had the King stayed at home, he would probably either have been dethroned, or been forced to comply with the dominant sentiment of the nation in ecclesiastical affairs. Trying to coerce Scotland from his position of power in England, he provoked a civil war there; that civil war accelerated the outbreak of another civil war in England. Scotland was herself in the end conquered by an English army under Cromwell, and, after a brief lull in the storm, the Restoration of Charles II. opened another period of bloodshed, oppression and cruelty which ended only after another civil war, with the establishment of the Presbyterian system under William and Mary. In this dreary tale Mr. Lang finds only one noble figure, only one character standing out from the general folly or turpitude, the figure of Montrose. The best parts of his book, and certainly the most readable, are those which describe the campaigns of that brilliant leader. If we cannot go so far as Mr. Lang does when he calls the burial-place of Montrose in St. Giles's Church (in Edinburgh) "the most sacred spot in Scotland," we can admire the chivalric spirit of the great Marquis, his energy and resource in war, the courage that sent him to his death in the cause of a faithless and contemptible prince. He shows to great advantage by the side of the time-serving and selfish Argyll, and indeed of nearly all the Scottish nobles of that generation. They were not as ferocious as had been their grandfathers in the days of James the Fifth and Mary, but they were almost as tricky and unstable. Yet lovingly as Mr. Lang dwells on the military exploits of his hero, he does not make Montrose as living and real a figure as we had hoped he would. A more definite impression is conveyed to us of Lauderdale and of Sharp, the Presbyterian minister who became archbishop of St. Andrews, and, having incurred the wrath of the extreme Covenanters by what they deemed his apostasy as well as by the severities which he bore a part in inflicting, was murdered on the Magus Moor, in Fifeshire. Cromwell moves across the scene, but little is said of him, and nothing of the other Englishmen who came into the story. It is a pity that Mr. Lang does not keep his readers better informed of what was passing in England from 1638 to 1651; he seems to assume that they are carrying it all in their minds. This no doubt they ought to do, but it would be convenient to them to have the main facts given, if only in an occasional note.

Scotland produced no first-rate statesman or leader of the people during all this troublous time, hardly even any man high in the second rank. She had not only no Cromwell, but no Hampden and no Pym. This may be set down to chance; there was no

man in the French Revolution big enough for the events till one came from Corsica. Yet perhaps it is not merely chance. We feel through all these civil debatings and ecclesiastical wranglings, breaking out ever and anon into wars, the want of that kind of solid common sense and public spirit and reasonable view of things which show themselves in England even in her most distracted days. Was this due to some inferiority in the Scottish character, to a hotter sort of passion, to a tendency to look at things "in the aibstract"? Or can it be ascribed to the difference in the social and economic conditions of the two countries, and to the absence in Scotland of that long experience of political life which the English had? Ever since Henry the Third's time, they had been accustomed to work a Constitution—a Constitution loose, no doubt, according to modern ideas, but still a Constitution which had its rules and its maxims. They had long known and prized their Parliament, a Parliament which had come scathless through civil wars in the fifteenth century and a kingly power that was almost despotic in the sixteenth. They knew what politics meant, and they did not let religion swallow up politics, even when they were most furious against the Pope, or when the soil was seething with new and strange sects — Anabaptists, Brownists, Quakers. Scotland had never had any such regularly working Constitutional assembly. She had been the prey of incessant disorders. She was really as far behind England in the political side of civilization as she was in wealth and the comforts of life. The Scotch had already shown, since the days of Alexander of Hailes and Duns the Scot, that there was no lack of intelligence among them; but they were among the least known and least regarded of European peoples, and no one could predict the place which, small as they were, they would ultimately win.

The distemper of religious passion had been raging all over Europe for a century when the Scots raised the standard of the Covenant in 1638—that standard round which the two factions fought till Presbyterianism, if not the Covenant, finally triumphed, after fifty more years of bloodshed, in 1689. Scotland was only one of many countries that suffered from it, and some of the other countries carry their scars to this day. But Scotland was the only country in which the idea that the nation as a whole must legally pledge and bind itself to God, after the fashion of the bond which united Israel to Jehovah in the Old Testament, came to dominate men's minds and become the centre of controversy. Why this happened is a curious problem which Mr. Lang has still an opportunity in his concluding volume of endeavoring to solve. He shows himself so well read in Covenanting literature that he doubtless possesses the materials, if he will try to handle them with a little sympathy, for helping us to a solution. With his exceptional gifts he will, it is to be hoped, give us, before his narrative comes to a close, a philosophic study of the forces that were at work through Scotch history, together with a fuller account of the social phenomena of Scotch life, and the part played by the classes that stood below these mostly repulsive nobles who fill the foreground of his pictures. No one should know better than he does how to extract a gleam of humor from the dismal record of raids and skirmishings, and intrigues, and abominable yet futile persecutions which makes up the greater part of the history of this seventeenth century in Scotland. But the gloom of the time is too much for him. We have now and then a touch of fun in watching the tergiversations of such men as the elder Argyll and Atholl, now and then a happy quotation, like that of the Scotch proverb, which he applies to the Remonstrants, that some men are "kittle to shoe behind." But these do little to relieve the sombre monotony. Our author is too much occupied in pouring out the vials of his wrath upon the sectaries whom he dislikes, and in showing that every atrocity committed upon Presbyterians had its justification, or palliation, in some other atrocity committed by Presbyterians upon Roman Catholics or Episcopalians, that he gives us far less entertainment than might have been expected from such a pen as his.

One curious moral stands out from the whole story. If Mr. Lang is right, every one in Scotland was either a persecutor or persecuted. Nobody would even tolerate his opponent, much less allow that his opponent might possibly have some glimmer or fragment of the truth. It was left for the English Cromwell to say, in his letter to the Commission of the General Assembly in August, 1650 (p. 233): "Is it therefore infallibly agreeable to the Word of God, all that you say? I beseech you in the bowels of Christ, think it possible that you may be mistaken." Yet the doctrine of full and absolute liberty of conscience, dimly hinted at by one or two stray thinkers in the Middle Ages, had already been proclaimed in England, and, in the very year when the Covenant was adopted by the people of Scotland as the basis of its national existence, that doctrine had been made by Roger Williams the foundation of his colony at Providence, which has grown into the State of Rhode Island. Like other peoples before and since, the Scotch fell under the dominion of the Old Testament so much as to forget the New. Their faith brought them not peace, but a sword. "Tantum relligio potuit suadere malorum" might be the motto for the history of the Scottish Reformation in this century.

THE FIRST JAPANESE CAMPAIGN.

With Kuroki in Manchuria. By Frederick Palmer. Illustrated from photographs by James H. Hare. Scribners. 1904.

This first of the Mantchurian war books is likely to be excelled in no vital quality by any part of the library yet to come. The author went to Japan, from Japan to Korea, and thence into what was Russian Mantchuria, with a cosmopolitan experience in the observation of warfare that compelled him to write to the point. Accordingly he wastes no time upon himself; he ignores, except as they illustrate conditions in the field, the discomforts and trials that civilians attached to a marching army must undergo, and he describes public not private affairs. A civilized island race, transformed from fighting with swords and bows to fighting with small-bore rifles and battleships, and impelled to acquire room on the mainland for its congested population, is, nearly in Mr. Palmer's words, one factor of the situation that presented itself. Korea as a geographical dagger pointed at the heart of Japan with a foreign hand upon the hilt—Yamagata's view of the situation—is the other. So the Japanese contention is plausible, that this is a war of defence in anticipation of invasion, an imperative effort to delay if not to terminate the "glacial approach" of Russia, whose uncontrolled possession of the seaboard would not only practically blockade the islanders, but would be a constant menace to the integrity of their empire. However, the book is a narrative of facts, not a discussion of statesmanship.

An excellent example of even-tempered intelligence is the recognition of the problem that the foreign press presented. More disastrous than the South African plague of flies and women, which only tormented the disabled, the budget of a prying newsgatherer, once opened to the world-pervading telegraph, might readily prove a Pandora's box to too obliging hosts. The unwelcome company of journalists, so easy to become more than a risk, a positive although undesigned danger, appears to have been the only contingency unanticipated in this prearranged war of precision. Japan had forgotten that wheresoever the carcass is, there will the eagles be gathered together. But upon their arrival the authorities did not hesitate to do what American, and doubtless European, generals have often prayed might be done. Better than a censorship of the pen, although presumably combined with it, they restrained the writers themselves until the armies were well under way, and afterwards held them in a careful leash. It was Japan's war, and Japan could afford to expose no part of her plan for the gratification of curious or sensation-loving foreigners. Mr. Palmer appreciates this at its full value, and it has not prevented his giving interesting and instructive views of the wonderful conflict without those querulous complaints that have been heard elsewhere. He recognizes that an army fighting for its country has another mission than to furnish "copy." But "the contention that a modern army cannot keep its secrets and have correspondents in the field, has been made ridiculous by the Japanese success in this respect. It can never be used again to excuse military incompetency." However, that these correspondents were ingulfed in the sea of an unknown tongue has greatly assisted in maintaining that secrecy.

What impressed the author among the conditions that he has succeeded in placing before the reader, was not merely the tactical skill of the Japanese in taking up offensive positions and deceiving the Russians as to their probable points of attack, but the ingenuity with which every man not necessarily in view and every gun were masked. There was no bravado nor spectacular play, no revelation before the time. But when the hour struck, the blow fell. At the crossing of the Yalu, the breaking out of the infantry from behind their natural ramparts and the batteries from their artificial screens reminds one of the manifestation of a Virgilian deity, in the good old days of Æneas, from its nimbus, its pillar of cloud. This unmasking was of Mars himself. In the immediate presence of the enemy, these fighting furies did not hesitate to conceal themselves before the combat, nor with infinite pains to

extemporize from cornstalks and shrubbery effective "covered ways" to veil from hostile observation the passers-by, whether coolies or cannon. But, once in motion, they persevered. When Ord led the Army of the James from Farmville to bar the way of Lee, fleeing before the Army of the Potomac, he stimulated his men by a series of little roadside speeches, insisting that if they would only maintain their gait they surely would win; that good marching would terminate the war. And legs won, for the presence of that infantry across the Lynchburg road made Appomattox what it was. Jackson's "foot-cavalry," sometimes overrated it may be, but, despite its stragglers, extraordinarily effective, gave another illustration of the efficiency of vigorous infantry, properly handled. It is so also in the East. After the Yalu was forced, when an average army, having accomplished its immediate object by severe and prolonged effort, might have sat down, this army pursued. It justified the prophecy of one of its officers, that the mobility of the infantry would be used to offset that of the Cossacks, and "these little men, who had been ceaselessly at work for thirty-six hours, were only beginning the day. . . . [The advance] followed up its advantage with stubborn persistence." This persistence resulted in the capture of 1,000 prisoners, besides twenty-one field-guns, six Maxims, and small arms and transportation in proportion. The Russian casualties, other than the prisoners, were as two to one as compared with those of their assailants. All this occurred at Hamatan, miles away, where the vigorous pursuit overtook the sluggish retreat. This consecutive vigor augmented the victory. The Russians were immeasurably outnumbered from the first, but through sheer folly they suffered these losses. They invited the disaster by turning, without preparation therefor, an action that at best could have been only one of delay into a formal battle, with no more regard for lines of retreat than was the boast of a general in our civil war. Mr. Palmer philosophically accounts for their behavior by combining the contempt of a white for a yellow man with the character of the Siberian troops engaged, and the condition of the old commanders, inactive over their samovars, through eons of peace.

Much acute observation and sensible comment is met with in these pages. Especially interesting is the contrast between the Chinese and the Japanese national character. The Chinaman, intensely attached to his family and beyond it to his clan, seems incapable of appreciating the claims of country. For instance, although not mentioned here, in the war of 1894 the Chinese fleet at the mouth of the Yang-tse positively declined to coöperate with the fleet in Korea Bay, not from affirmative disloyalty, but because the admiral failed to recognize any reason why he should embroil his squadron with the happenings at the north. At the same time, the individual Chinaman has a most satisfactory contempt for death when the motive for exposure appeals to him. That motive is usually pecuniary. The Japanese burns with martial ardor, whose inspiration is the identity that he maintains with the Mikado as the real father of his people, and hence with the whole nation as of the same family; and in their defence or aggrandizement he sacrifices everything. Thus, the humblest bearer, ineligible for military honors and beyond the possible range of personal praise, receiving the merest pittance and condemned to constant drudgery, serves the military host with an industry and a spirit that leave nothing to be required, all because of this essential patriotism.

Those who have seen an army in the field will be filled with admiration for the man in the ranks, the short, stocky "buttress," not the scraggy-necked, long-legged "pole," who bears his forty pounds to the end of his day's march and remains in line. Judging by the illustrations, he carries the old type of knapsack, which progressive officers have so long attempted to discard, "the monkey on the back" that breaks down the average soldier, that crushes the ordinary recruit. But Nippon Denji, the Man of Japan, whom Mr. Palmer apostrophizes from time to time, comes through, knapsack and all, without delay, and, best to know, without straggling. The marches, shorter than those over the superb roads of Europe, are the tireless advance of the whole body, exactly as the system of precision foreordains. This war has demonstrated not only the possibilities of machine-like movements, but at least two conditions for soldiers to remember. It has shown that the bayonet (which seems to be a sword-bayonet and not a sharpened steel rammer) is not obsolete, and that night attacks, not merely surprises at dawn, are again fashionable and convincing.

It is fascinating, this collection of field letters; and chapter nineteen alone, because it was written by a man who had other standards for comparison, is worth cords of the grumbling of the correspondent who finds the little yellow man to differ from the Seventh New York, let us say, and therefore thinks ill of him; and is better than clouds of incense from the enthusiast who praises the successful soldier because he is successful, he knows not why. The chapters on the campaign against Liaoyang—the book closes there—are an admirable popular exposition of active war, where audacity counts as well as the more formal rules of the game.

The only observed blemish that a subsequent edition might omit is the statement, which is repeated, that in his youth Marquis Ito cut off his queue when he went abroad surreptitiously. In those days the Japanese did dress their hair with a sort of top-knot, but it was not a flowing queue *à la Chinoise*, as might be inferred. Some other designation for the style had better be used, less likely to lead the unwary to imagine that the Mantchurian badge of conquest had once been naturalized in the Land of Sunrise. And then, when one finds "different to" (p. 141), he is almost deceived into taking the writer to be imported. One had rather retain him without such disguise. That such a war should come is lamentable; having come, this truthful and vivid portrayal is delightful.

THE STANDARD OIL COMPANY.

The History of the Standard Oil Company. By Ida M. Tarbell. 2 vols. McClure, Phillips & Co. 1904.

Few luxuries are greater than to give way to righteous indignation, and the prosperity of the wicked has from the days of Job afforded the chief opportunity for this indulgence. We are all secretly conscious that our merits are not fully appreciated, nor our deserts properly rewarded, and we are only too ready to believe that great success is attained by evil means. The man who has to support a family on a dollar a day thinks it unjust that his employer should have ten dollars, and his employer is quite sure that no one can honestly earn a hundred. When it comes to incomes of a thousand dollars a day, the condemnation becomes general, and the richest man in the country is the object of universal execration.

This book seems to have been written for the purpose of intensifying the popular hatred. The writer has either a vague conception of the nature of proof, or she is willing to blacken the character of Mr. John D. Rockefeller by insinuation and detraction. She undoubtedly knows her public, and it is unfortunate, from the dramatic point of view, that Mr. Rockefeller has been caught in no worse crimes than underselling his competitors and getting rebates from railroads. When we come to look into the matter, we find that the directors of the Standard Oil Company did not, as is commonly believed, conspire to blow up a rival oil refinery in Buffalo. But this does not discourage our author. A still did explode, or come near it, and there was a trial on a charge of conspiracy. A whole chapter is devoted to this episode, on the ground that it illustrates the evil results of "the Standard policy of making it hard for a rival to do business," and shows the judgment to be expected from a hostile public. The public "read into the Buffalo case deliberate arson." It refused to admit that there was no evidence of the guilt of the Standard Oil directors, "but demanded that they be convicted on presumption." The inference to be drawn from this chapter by the ordinary reader is that, while Mr. Rockefeller perhaps did not personally blow up the still—it is not clear that any one tried to—he would probably not have grieved had the attempt been successful if it had been made; and that he is at all events no better than he should be.

His depravity appears again in a transaction with a widow whose husband had left her a refinery in Cleveland. This property the widow had offered for sale to another party at a price considerably less than Mr. Rockefeller paid for it two years later, which price Mr. Rockefeller avers was 50 per cent. more than the property was worth. He states, indeed, that the works for which he paid $60,000 could have been replaced for $20,000. He avers further that when the widow told him that she was afraid of the future, and especially that she could not get cars enough to transport her oil, he offered to lend her his cars, or do anything else in reason to assist her. As she still wished to sell, Mr. Rockefeller's agents attended to the transaction. It is asserted by the seller that Mr. Rockefeller had told her that she might retain some of the stock in the company, a promise repudiated by his agents. The widow wrote to him at once in complaint, and the day after he received the letter Mr. Rockefeller replied, to the effect that he had understood her to prefer to receive the whole price in money, but that if she wished stock she could have it, or that he would, if she

chose, return the property. When this offer was received, the seller declares that she had made such arrangements that she could not conveniently accept it, and indignantly threw the letter containing it into the fire. This transaction is represented by Miss Tarbell as taking a deep hold on the public sympathy, and as contributing to make the superstitious fear of resistance to Mr. Rockefeller almost insuperable. It is undoubtedly true, Miss Tarbell concedes, that this widow was not obliged to sell out; nevertheless, "she gave up her business to avoid ruin."

It is a matter of public notoriety that Mr. Rockefeller is offensively reticent. The most enterprising reporters cannot induce him to talk, and his perversity is so well known that the most unscrupulous do not dare to invent "interviews." Miss Tarbell complains of this exasperating taciturnity, although she tells us that the officers of the Standard Oil Company have offered her every assistance and discussed every episode in its history with her; but she has hit upon a simple and ingenious method of defeating its odious purpose. It is only necessary to attribute certain cruel and hateful intentions and sentiments to Mr. Rockefeller, and then to express them between quotation marks. This imparts crispness to style, and the ordinary reader may be trusted to be careless enough, or prejudiced enough, to carry away the impression that he has heard the monster's *ipsissima verba.* But a careful study of the records made by any one who is able to distinguish assertion from fact, does not make it clear that Mr. Rockefeller ruined all his competitors. He seems to have usually bought them out, representing that they were in danger of being beaten in the race, and to have advised them to become partners in his concern. The Standard Oil Company, like the railroad companies, has exercised a kind of eminent domain. In order to systematize a business conducted with frightful waste, property was condemned; but the owners received compensation.

Another rhetorical device is personification. In impassioned, if turgid, language, a desperate struggle is described between the powers of evil incarnate in the Standard Oil Company and the powers of goodness appearing in a metaphysical entity called the "Oil Region." This being, it appears, loved virtue for its own sake; it believed in independence and fair play; it hated rebates and secret rates; it hated, but it also feared, its adversary. Very eloquent appeals for our sympathy with this generous being are made; but when we descend to the concrete our feeling cools. The "Oil Region" means a number of men engaged in the wildest kind of speculation, many of whom proved themselves willing to engage in every kind of wickedness of which the Standard Oil Company was accused. They conspired with one another and with the adversary. They accepted secret rates and rebates when they could get them; they sold out; they limited production, they put up prices by combination, they destroyed the property of their rivals, they violated their agreements; and all these sins are attributed to them by Miss Tarbell herself. She tells us of a man who confessed that he had been stealing oil for two years from the Standard Company, and who was found innocent by a jury, the verdict being approved by the Oil Region. The blame for this apparent lapse from virtue is laid upon the victim of the theft. The hideous mien of the monster had been seen too oft; the iniquity of the Standard Oil Company was contagious; and the Oil Region might say, like the French deputy to his constituents, "So intense was the corruption that even I did not altogether escape."

Men who can remember the discovery of petroleum will smile at the suggestion that the early producers and refiners were of different stuff from what is to be found now in a mining camp. Miss Tarbell tells us that they counted on profits of 100 per cent., and had no conception of economical production. They spent their profits as fast as they got them, and when the price of oil fell they denounced every one but themselves. The managers of the Standard Company seldom made such profits; they certainly did not spend them. They paid moderate dividends, and put their surplus earnings into their property. They displayed very great skill in carrying on their business, and it is by no means incredible that their good management resulted in economies that were equivalent to a large profit. One of the best chapters in the book is that on the legitimate greatness of the Company; and, although the particulars are inadequately given, enough is told to show that ordinary competitors could not possibly have succeeded even if their great rival had been indifferent. Yet it is true that there are and always have been independent refineries and pipe-lines. Miss Tarbell accuses the Standard Oil Company of many odious practices in the way of underselling and espionage. That such practices are odious is true; but competition is necessarily odious. Competition means that A will try to sell to B's customers, and B to A's, and the only escape from conflict is in combination. It is absurd to represent "Standard Oil methods" as peculiar.

In one sense this book is a history. It tells us profusely what was said, what was believed, what was suspected, what was charged. It repeats to a tedious extent and adopts slurs, insinuations, slanders—possibly, sometimes perjuries. But as to what was done, the record is imperfect. The great matter involved was the transportation of oil. The managers of the great railroads, in the seventies, were engaged in desperate competition. They apparently lied to one another and to their customers. They broke their agreements and granted all sorts of rebates in order to get business and to keep it from being diverted from them. Deplorable as it was, the managers of the Standard Oil Company were compelled to fight the devil with fire. If they had not obtained special rates, they would have seen their business pass into the hands of rivals who were less scrupulous. A vast mine of wealth was suddenly disclosed, great fortunes were to be made, and it was a question who should make them. Had the men who made the Standard Company never existed, other men would have done what they did, with perhaps equal gain to themselves and perhaps less gain to the consumers. It was a condition and not a theory that confronted the oil refiners, and they met the condition as best they could.

The theory of rates on which Miss Tarbell bases her denunciation is altogether untenable. She labors under the impression that rates are equal, just, and fair, only when the charge for carrying a barrel of oil is the same proportionately as that for a carload or a trainload. She tells us that in 1872 Mr. Rockefeller shipped daily from Cleveland to New York sixty carloads of oil. By moving these cars in solid trains, the time for a round trip was reduced from thirty days to ten days, the number of cars needed was reduced from 1,800 to 600, and the investment in cars from $900,000 to $300,000. To charge the same price for transportation which costs less is not to maintain equal rates; it is to discriminate in favor of small shipments, to furnish a service which costs more at the same price as one that costs less. Until this truth can be beaten into the heads of the public, the various nostrums which are presented to Congress will continue to embarrass the country, and to arouse expectations that will surely be disappointed. To determine the actual cost of carrying any commodity is literally impossible; to define precisely what rates are "equal" is beyond human capacity; and to fix rates from Chicago to New York and Philadelphia that will be accepted as fair by both cities and the rest of the country, can be done neither by the Interstate Commission nor by all the courts that now exist or can be hereafter constituted.

We have dealt with this book at length, not because it is to be taken as serious history, or because Mr. Rockefeller and his associates are in want of sympathy, but because it is desirable to protest against attempts to treat grave problems sensationally. To stir up envy, to arouse prejudice, to inflame passion, to appeal to ignorance, to magnify evils, to charge corruption—these seem to be the methods in favor with too many of the writers who profess a desire to reform society. They will not accomplish reform in this way, but they may conceivably bring on revolution. They are doing their best to stir up hatred and to excite bitter feeling. They propose to educate the people by unfitting them for calm judgment and rational inquiry. We need reforms badly enough, but we shall not get them until we have an electorate able to control its passions, to reserve its condemnation, to deliberate before it acts. When that time comes, a railing accusation will not be accepted as history.

George Canning. By W. Alison Phillips. E. P. Dutton & Co.

The most striking feature of this short biography is the passage with which it closes. Mr. Phillips admires sufficiently the imposing presence, the personal force, the wit, the eloquence of Canning, and admits that his ambition was of the noble sort. But none the less he declines to join in the unstinted praise which was poured upon their lost leader by the Tories of 1827.

"That he did a great and necessary work for England," says Mr. Phillips, "is true enough, . . . yet what has been said of Metternich seems to be true also of him: that he was less skilful in discerning the direction and force of the great undercurrent of human affairs, than in dealing with those phenomena which from time to time appeared on the surface. His great speeches on Reform, so impressive when delivered, form curious reading now. The 'will of the people' has long been expressed in Parliament; yet who will say that Edward VII. is less firmly seated on the throne than George IV.? Or who will affirm that the

House of Lords is impotent to stem the violent onrush of democratic legislation?"

Even the foreign policy of Canning, which has been so generally extolled, Mr. Phillips will not admit to have been suggested by the highest wisdom, despite its effect in raising England from the fifth place among European nations to the position of umpire. And here he seizes for his crucial point upon Canning's favorite principle of nationality:

"The Grand Alliance had been established in the interests of peace; Canning proclaimed that the interests of peace would be best served by studying the rights of nationalities. Yet the clamor of nationalities for their rights has been since, and will yet be, the most fruitful cause of bloodshed; and in our own day, as the direct outcome of the principle which Canning championed, we have the nations of Europe weighed down under the crushing burden of an 'armed peace' almost as intolerable as war."

When one has read these two passages he has grasped Mr. Phillips's attitude toward the subject of his sketch, for it is upon the concluding years of Canning's life that his reputation rests rather than upon his term of service under Pitt or upon his first tenure of the Foreign Office. For ourselves we must confess to having a higher opinion of Canning than that which Mr. Phillips seems to hold. His speech on Reform we should be inclined to call interesting, not curious, reading; and it may be doubted whether at the present moment he would not accept the attitude of the late Mr. Lecky. That Canning was not the man to modify his views under education as Sir Robert Peel did, is clear, but there is little about his principles or his expression of them which seems more "curious" now than in his own day. As to his foreign policy, Canning recognized in nationality the strongest of all political forces—stronger, if a comparison were forced, than democracy—and it is at least an open question if his forecast was not justified. Of course the "armed peace" is expensive, but then countries like Germany and Italy get something for it—more, certainly, than they got without a national organization between the Congress of Vienna and 1848.

Controversy, however, should play a small part in our notice of this excellent little book. The Canning of a precocious boyhood and *Anti-Jacobin* wit will ever remain a bright figure in British politics and literature. Mr. Phillips gives us some of the stories about his youth, but there are others which he has not seen fit to include. Prominent among these is the jest which was circulated at Canning's expense when he entered Parliament under the auspices of Pitt. At Oxford his debating powers had made him known even to Sheridan and Fox. Accordingly, when he came to London he was introduced at Devonshire House and made free of Whig society as a prospective ally. But Pitt stole a march upon his opponents by offering Canning a seat in Parliament at the age of twenty-three. Apparently no undertaking of support had been given to Fox, and Canning accepted Pitt's advances; whereupon the young member of Parliament was greeted with the following jest, which is a compliment to his talents while a slur on his consistency:

"Turning one's coat so common is grown
That no one would think to attack it.
But never till now was an instance known
Of a schoolboy turning his jacket."

Mr. Phillips gives a good account of Canning's connection with the *Anti-Jacobin*, and quotes in complete form some of its most sparkling verses; for example, "The Needy Knifegrinder" and "Mrs. Brownrigg," besides giving a typical excerpt from the "New Morality." To one of Canning's most famous poems, however, no allusion is made. We refer to the eloquent verses on "The Pilot Who Weathered the Storm"—lines wherein Canning's devotion to Pitt shines forth more clearly than in any other of his utterances. By way of compensation for this omission, Mr. Phillips cites with admirable comment the "Lines addressed to Miss Scott before Marriage," which deserve to be widely known, both from their intrinsic merit and from the light they throw on Canning's character.

Among the political questions which are taken up, the attitude of Canning towards the Holy Alliance receives fuller and more interesting notice than any other. Incidentally Mr. Phillips shows by reference to official correspondence that Castlereagh was not so docile a follower of the Tsar as he is frequently supposed to have been. For example, Castlereagh resented equally with Canning the remarkable claim contained in the protocol of Troppau which would have given the Alliance a right to regulate the domestic affairs of states in addition to supervising their foreign relations. What stand Castlereagh would have taken had he been alive when the Duc d'Angoulême entered Spain to restore Bourbon absolutism, can only be conjectured, but the tragedy which removed him from the Foreign Office and opened a way for Canning placed the latter in office at a time of crisis, and thrust upon him the necessity of defining England's relations towards the Powers of Europe. First of all he was determined that no symptom of rebellion in Ireland or other issue of prime importance to England should be made an excuse for foreign intervention in British affairs. When the royalist *Etoile* instanced the disturbed condition of Ireland as a menace to European peace, Canning was ready to declare his position quite frankly. "Naples, Piedmont, Spain, Ireland! Who shall draw the line if the principle of the 'European question' be once admitted?" His defence of independent nationalities against the confederation idea had its solid cornerstone in his resolve that neither Alexander, Metternich, nor the Comte d'Artois should have the least excuse for interfering with England.

Canning's part in the war of Greek independence and his share in the evolution of the Monroe Doctrine are treated by Mr. Phillips at adequate length, although he does not attempt to add fresh information at either of these points. Another large subject which he is able to touch upon only slightly, is Canning's support of Huskisson, when the state of the country clearly demanded a reduction of the corn duty; but Canning's attitude toward this issue as well as towards Catholic Emancipation is well understood, and requires less explanation than is demanded by the development of his views on foreign policy. Mr. Phillips has managed to say a great deal in a brief compass, and this volume will add to the reputation which he gained by his book on 'Modern Europe.'

Abraham Lincoln. By Ellis Paxon Oberholtzer, Ph.D., author of 'Robert Morris, Patriot and Financier,' 'The Referendum in America,' etc. (American Crisis Biographies.) Philadelphia: George W. Jacobs & Co.

The publishers of this series pledge their consecutive writers to an unhistorical and radically false interpretation of the civil war: "The civil war will not be treated as a rebellion." Examining a list of the intended writers, we find ourselves wondering how many of the nineteen announced will be able to stretch themselves comfortably on this Procrustean bed. It has seemed to Dr. Oberholtzer "that there is lack of a readable, compact life of Lincoln by one who never saw him." But this lack was already met by Mr. Hapgood, whose book was quite as compact as Dr. Oberholtzer's, and more readable, more literary, and less journalistic, as keen upon the scent of Lincoln's faults, but with a livelier appreciation of the man's essential worth. The only exigency to which this book responds is, of course, the need of a Lincoln volume in a series which, without one, would be manifestly incomplete.

Dr. Oberholtzer writes clearly and forcibly for the most part, but with an occasional verbal arrangement that makes his meaning hard to understand. For example (p. 16):

"His wanton assassination, at a time of public excitement, raised up eulogists on every hand, and years of graceless nonentity as an ex-President saved him from semi-oblivion and the possible detraction growing out of later movements, which sometimes neutralize the impression created by the most brilliant career."

To guess what was intended here may not be difficult, but the expression could not be lamer than it is. If Dr. Oberholtzer says what he desires to say in the following sentence, his syntax is less at fault than his intelligence:

"The loyalty of the Southern women, which has not been surpassed by anything ever recorded of the women of France, must be held to have been largely due to the well-grounded impression that the Republicans were advocates of a civilization which would result eventually in the predominance in America of a mulatto race."

The first sentence of this Life characterizes the civil war as "a trial of the fundamental nature of the Union for the sake of the black slave." This is to put the cart and horse where they belong. It recognizes that the saving of the Union was not the ultimate end or inspiration of the war. But Dr. Oberholtzer does not keep a steady keel upon his anti-slavery course throughout his book. To change the figure, he runs with the hare and hunts with the hounds. He depreciates the force of Lincoln's earlier anti-slavery sentiment, at the same time blaming his slow awakening and praising his affront of the more radical anti-slavery party. Against the abolitionists he habitually sharpens his countenance, but an occasional inadvertency seems to carry him over into their camp. Writing of the victories of 1863 he says:

"Those who two or three years before would have cheerfully assisted at the funerals of William Lloyd Garrison and Wendell Phillips, were coming into perfect sympathy with them, looking upon slavery as the abomination it always was and always will be, and eager enough to forget that any other view of the subject had ever been entertained."

It is an instinct with Dr. Oberholtzer to minimize all appearances of high purpose and noble ardor. Lincoln's concessions to the anti-slavery spirit he reduces to their lowest terms. "He issued his edict of freedom as a war measure and on no ethical or sentimental grounds." Certainly none that were avowed; but Lincoln had not forgotten his parable of "the divided house," and it seems not unlikely that when he grasped emancipation as a war measure he made the exigency an excuse for striking at the rebellion's inmost heart. Touching the feelings of the slaves on their emancipation, we have another minimizing view:

"Their grief at Lincoln's death more fittingly expressed the loss they would feel because of their too hasty introduction to all the responsibility of citizenship by other men when Lincoln's commanding grasp relaxed, than the regret inspired by anything he had positively done in the act of emancipation."

It is improbable that any signs of a grief so constituted ever existed beyond the pale of Dr. Oberholtzer's ingenious imagination.

The "Bibliography" of this volume is remarkable for its inadequacy. If it had included a good biography of Garrison, there might have been clear gain in some particulars—notably on page 167, where "Garrison and the Abolitionists" figure "on the floor of Congress" denouncing slaveholders in terms more accurate than soft, and on page 169, where we read of "the Garrisonian-Giddings-Lovejoy-John Brown method, which contemplated the sending of emissaries among the slaves to incite them to murder and insurrection"; a mixture of incongruous names, suggestive of Carlyle's "Heaven and Hell Amalgamation Society." It is pitiful that Dr. Oberholtzer should need to be informed of what every intelligent reader of his book should know, that Garrison was absolutely opposed to John Brown's method, and to any and every attempt to stir up slave insurrection.

Dr. Oberholtzer's predilection is for such memoirs as serve the more sordid and vulgarizing conception of Lincoln's character. Herndon's, and even Lamon's, baser insinuations are sweet morsels for his tongue. The ghastly Mary Owens episode is presented baldly enough, while the Anne Rutledge story is told with grudging sympathy. The chapter on the Lincoln-Douglas debate of 1858 exhibits a judicious use of the biographer's best material. That on the nomination of 1860 is calculated to make our contemporary political methods seem tolerably respectable. The war chapters are good, and bring out the larger elements of Lincoln's character in strong relief. There are three generalized chapters, "The Slave in the War," "Lincoln the Politician," and "Lincoln the Man." The first of these makes far too little of the sincere anti-slavery spirit pushing against manifold opposition to its glorious end. In "Lincoln the Politician," there are many lines that we would gladly blot, such justification will the baser sort find in them for their crooked ways; but that Lincoln did not always pursue virtue virtuously seems to be incontrovertible. The seamy side of his personal characteristics is needlessly paraded in "Lincoln the Man," but his great powers of sympathy and tenderness are permitted to shine with splendid radiance. Dr. Oberholtzer's book will do nothing to enhance Lincoln's fame. Those will be most grateful for it who are tired of hearing Aristides called the Just, and those who enjoy the writing down of history to the level of the more sinister and sordid manifestations of the human spirit.

The Preparation of the Child for Science. By M. E. Boole. Oxford: Clarendon Press; New York: H. Frowde. 1904.

Mrs. Boole's little books, taken as a whole, have a certain unity, but their value does not lie there; and what is true of the whole is true of any one. The present volume is decidedly the best of the series thus far. Information and salutary wisdom are to be drawn from it everywhere. The very dedication informs us of a fact interesting for the history of science in England, that Sir George Everest, on his return from India about 1829, inflamed the minds of Babbage and John F. W. Herschel with "certain ideas about the nature of man's relation to Unknown Truth which underlay all science in ancient Asia, and which he had learned from Brahman teachers." It would be curious to reperuse the books that Babbage, in 1830, and Herschel, in 1831, published about the general nature of science (a subject that had long been untouched in England) in the light of this information. Certainly, they two and Everest's son-in-law, Boole, are, as mathematicians, marked by their great predilection for what are called "symbolical" methods (that is, reasoning about operations as if they were things), to which English mathematicians generally, both before that day and since, have shown a marked aversion. The preface contains brief notices of ten writers whose thought pursued paths off the main lines of intellectual traffic. Two of them, Boole and Babbage, are famous; one, Nicolas Antoine Boulanger, once was so; Père Gratry is still read; and a fifth, Ramchundra, received aid from the British Government in his mathematical researches. The others, Thomas Wedgwood (who made a study of Genius), James Hinton (author of 'Life in Nature,' etc.), Dr. Charles Winslow (author of 'Force and Nature'), "the late Dr. Wiltshire," and Benjamin Betts, never attracted much attention, but would seem to be worth some acquaintance.

The purpose of this little volume is to offer "suggestions as to means by which the scientific condition of mind can be induced" in children. The desirability of doing this is a topic distinctly excluded. In the first chapter, the scientific mind is portrayed, slightly, but with a rare fidelity to nature. "Scientific culture is the result of a steady, life-long habit of friendly and intimate, though reverent, intercourse with the Eternally Infinite Unknown." This might have been better expressed; yet, taken as it is, of many a man of science (especially of a passing generation) who might think the likeness execrable it is more true than he himself knows. "The typically scientific mind," says the authoress at the beginning of the chapter, "may be described as one which stands in a definite relation to As-Yet-Unknown Truth, and especially to that portion of As-Yet-Unknown which is just below the horizon of knowledge"; and she goes on to explain of what nature this relation is, laying much stress "upon the rhythmic alternation of attitude" of such a mind toward phenomena.

Rudiments of all the scientific features begin to appear in the mind of every child, in one more strongly, in another less so. It is possible, however, to extirpate them. "That delicate sensitiveness to the touch of the illogical, to the limits of knowledge, and to the Presence of the As-Yet-Unknown . . . is often destroyed in the human brain by rough-and-ready processes, adopted sometimes for the purpose of fixing the opinions of young people, sometimes for that of enabling them to pass examinations successfully in subjects which they do not understand." When it first dawned upon "the advanced section of educationalists" that the rules of Latin grammar are not sufficient aliment for the mind, the first step was to substitute facts of natural science regarded as dead truth, just as the rules of grammar were regarded. Next, when it was forced upon the attention of the advanced that the scientific truth of one generation does not altogether accord with that of the next, "they substituted up-to-dateness, instead of endeavoring to induce the habit of true scientific method." Mrs. Boole herself embraces an "eternal truth" of mental pulsation, which she otherwise phrases as "alternation of opposites." Perhaps the scientific mind may alternate as to the truth of this doctrine.

We continue culling specimens of the volume's contents. The authoress protests that the spirit of inquisitive destructiveness brings more poison than pabulum to the scientific character, and, being naturally excessive in the child, ought to be restrained rather than stimulated. She thinks that "a good deal might be done by teaching children, when they see a flower, not to touch it till they have learned all they can of its poise and mode of growth, so as to be able, after dissecting it, to reconstruct in their minds an accurate picture of how it looked before they disturbed it." One of the points that must receive sedulous care from the earliest lessons of the child is that the line of demarcation shall be clearly preserved between what he has experienced and what he has learned at second hand. To this end, children must be drilled in the power of reproducing exactly what it is that one or another person has said; and from this point of view no study is more wholesome that that of Latin. "Give no more time to science than you can afford to let the children spend in the really scientific manner."

Chapter II. is about the unconscious mind, and particularly about those intervals when the current of thought almost or altogether comes to a standstill, so that the ideas that float in it have time to settle and to compact themselves. "We are sterile for lack of repose far more than from lack of work." "It is curious and painful to observe how many things have been proposed by true educationalists simply for the purpose of ministering to the action of the unconscious mind, and afterwards perverted, by persons possessed with the teaching mania, to the purpose of stuffing into children's minds some idea which is in the teacher's mind." Let children alone to their own thoughts or absence of thoughts during a good part of their time. Let them bother a carpenter, and pick up what skill

they can; and on no account pay the man for the loss of time they occasion, for then he will feel obliged to show them how to work.

Chapter III., on hygienic sequence in development, has much to say of the same color. Chapter IV., on mathematical imagination, deals with a subject of the utmost importance in education. The last chapter, on ethical and logical preparation, is perhaps the very best and most practical in the book; but we believe our readers now have some idea of what to anticipate from the reading of this and of the whole book.

Farmington. By Clarence S. Darrow. Chicago: A. C. McClurg & Co. 1904.

Farmington is the Pennsylvania village in which Mr. Darrow's childhood was spent. His publishers call this autobiography of a boy an "idyl," and it is certainly a "little picture," with human beings in a rural setting. There ends its idyllic quality. An idyl is not complex nor psychological, and Mr. Darrow's recollections are curiously and sadly analytic. On its lighter side the picture is charming enough. The boy's life centred round his father's old mill and all its associations:

> "The sleepy pool above the dam,
> The pool beneath it never still,
> The meal-sacks on the whiten'd floor,
> The dark round of the dripping wheel,
> The very air about the door
> Made misty through the floating meal."

His father, though, like Tennyson's miller, he must have had a "slow, wise smile," was, in the essential interest of his life, a thwarted man. Books were his passion, the mill was his necessity, not his choice; and, once the day's work done, he would retreat to his little study and read far into the night Latin, Greek and Hebrew. He would even carry his books with him to the dusty mill and snatch a moment's forgetfulness of his uncongenial toil. "To his dying day he lived in a walking trance; and his books and their wondrous stories were more real to him than the turning water-wheel, the sacks of wheat and corn, and the cunning, soulless farmers who dickered and haggled about his hard-earned toll."

The boy went to the district school outside the little town. Of that school, of the teachers, who were changed every season and were always unpopular; of the school readers, which we hope have long since been superseded, if we are to judge them from Mr. Darrow's quotations; of all the relations of boys and girls that grew out of the school life, Mr. Darrow gives an unsparing and unsoftened picture. It is not that he had a peculiarly unhappy childhood; all the accessories were there, all that a country-bred boy can extract from life in such a community was his. But it is obvious that what strikes him with most force, as he reviews those years before his teens, is the lack of knowledge of the childish mind, the lack of sympathy with childish pains and pleasures that most children have to endure from their elders. The path of the child is not smooth. Like the dog in Maeterlinck's essay, he is surrounded by problems and riddles which those who know have not the time or the kindness to explain. Life for both is full of humiliations and hostile forces, shadowed by incomprehensible suppressions of instinct, a continual disillusion. All about him are bent on his doing what he dislikes:

"It seemed to us as if our elders were in a universal conspiracy against us children; and we in turn combined to defeat their plans. I wonder where my little playmates have strayed on the great round world, and if they have grown as unreasonable as our fathers and mothers used to be. Reasonable or unreasonable, it is certain that our parents never knew what was best for us to do. . . . The very fact that we wanted to do things seemed ample reason why we should not. I venture to say that at least nine-tenths of our requests were denied; and when consent was granted, it was given in the most grudging way. The one great word that always stood straight across our path was 'No,' and I am sure that the first instinct of our elders, on hearing of our desires, was to refuse."

Mr. Darrow's chapter on "Rules of Conduct" should be read by all parents. The book is not one that lends itself to quotation. It should be read in the leisurely mood in which it was composed. Its simplicity, its monosyllabic, wholly unornamented style, almost amount to preciosity; but it is written with a sincerity impossible to question.

Arbitration and the Hague Court. By John W. Foster. Houghton, Mifflin & Co. 1904.

This book deserves all the attention that its author can ask. Mr. Foster writes with great knowledge and facility, and has made what he has to say about a subject inherently dry much more attractive than it might have been expected to prove. His publication, important in more than one respect, is, so far as we know, the first to give, in a small compass and an interesting way, the present status of arbitration and its practice under the Hague convention. This has already become of more consequence to the world at large than is generally understood—more, too, than was anticipated by many of the strongest friends of arbitration at the time of the assembling of the conference of 1899. When the Hague Court was established it was an experiment, such as had never been tried before. Treaties which should bind nations to arbitrate some, or all, of their differences, were one thing; it was demonstrable that such treaties were, wherever ratified, additional guarantees of peace; but not only would the establishment of an international court effect nothing unless the tribunal were resorted to—the mere fact of non-resort to it would throw a cloud over the cause of arbitration, and tend to the desuetude of arbitration itself. This doubt has been partly dissipated by the resort to the court in the "Pious Fund" and the Venezuela cases; while, apart from the tribunal itself, the machinery of inquiry provided for in Title III. of the Hague convention seems to have been adopted by Russia and England to arrive at a basis of settlement of the very dangerous questions growing out of the Dogger Bank disaster.

These are good instances of the weight which the mere existence of permanent international judicial machinery has in disposing quarrelling nations to peaceful ways of settling their disputes; but, outside of this, we have now in actual operation several treaties of general arbitration, *e. g.*, that between Spain and Mexico of 1902, the Netherlands-Denmark treaty of 1904, and the Anglo-French treaty of 1903, which may be said to have been called into existence by the Hague convention. These in substance provide, following the declaration of article xvi., either for the arbitration of all questions whatever (especially those of a "judicial order" and relating to the interpretation of treaties) which cannot be settled diplomatically, or for the arbitration of all such questions, provided they do not involve the honor, independence or vital interests of either nation. Further treaties of the same sort have been negotiated by Mr. Hay between the United States and European countries, which are awaiting the action of our Senate. To support the ratification of these the aid of the press and public is much needed. The enemies of arbitration, it may be expected, will do all in their power to defeat them, notwithstanding the insertion of the clauses excepting questions involving honor, independence, and vital interests, for they now perceive—what was not clear at first—that this exception is not likely in the long run to prove a serious obstacle to the settlement of any question by arbitration which is in itself capable of such settlement.

That there will always be questions which neither diplomacy nor arbitration will prove competent to settle, may be assumed; and it may also be assumed that such questions will come to appear, to one side or both, to involve honor, or vital interests, or independence, and will be settled by war. But such questions will probably be settled by war whether the right to go to war over them is reserved in a treaty or not. The reason, of course, is that in such cases one party or the other will not endure the arbitrament of a third Power, it may be because independence is really involved (and this cause is by common consent a justification), or it may equally be from a base determination to force a war upon an unwilling foe. It is impossible to imagine the Franco-German dispute of 1870 settled without war; our civil war had to be fought out to the end; no one has yet been able to reach a belief that the "good offices" of any third Power would have been tolerated by Russia or Japan. In all those cases no paper agreement could have affected the result, and, to our minds at least, it would not have made the smallest difference whether or not there had been a paper agreement, conventional or even constitutional, providing on the one hand that there should be no war at all, or on the other that war should be resorted to only if honor, independence or vital interests were affected. "Honor" and "vital interests," moreover, are very elastic phrases, and may mean much or little according to circumstances. It should never be forgotten that Lord Russell refused to entertain the idea of the arbitration of the *Alabama* claims on the precise grounds that honor and vital interests were affected; yet the *Alabama* claims were successfully arbitrated exactly as all our other differences with England have been since the war of 1812.

The great point is, that, a general treaty of arbitration once signed, when a new difference arises which cannot be settled diplomatically, the treaty, whether it contains this clause or not, interposes a serious obstacle which must be surmounted before war can begin. If the treaty contains no exception, the treaty at least must be fla-

grantly torn up; if there is an exception of "honor," "independence," or "vital interests," to which an appeal is made by the war party, it is still open to the peace party to show that the appeal is false, and a delay for this purpose may of itself avert war. Hence, what the enemies of arbitration dread—and among those enemies we may count, if not all supporters of, at least all those supported by, a large navy—is a general arbitration treaty, however worded; and what we should insist upon is the immediate ratification of treaties. We have provided for it in the Hague convention, several of the great Powers have carried out their promise in subsequent treaties, and it is now this country, the great promoter of arbitration, which lags behind. Mr. Foster calls attention to the fact that "the two most southern republics of this hemisphere" have united "in a treaty of peace and unconditional arbitration whereby their armies are disbanded and their navies reduced by the sale of a number of their battleships and the transformation of cruisers into vessels of commerce," thus terminating a controversy which threatened to drench both countries in blood for generations. This treaty of arbitration and disarmament between Argentina and Chile is an interesting justification of the Hague Convention.

Roma Beata: Letters from the Eternal City. By Maud Howe. Boston: Little, Brown & Co. 1904.

'Roma Beata' consists of familiar narrative of things Roman in letters to friends at home, from the point of view of an ardent lover of Italy, whose good temper and optimism are proof against eventualities disturbing to the ordinary traveller. Determined to "do in Rome as the Romans do," our author's attitude of mind is that of readiness to be enlightened by the native; and although she seems to have met with many flagrant cases of unreliable amiability and dishonesty in business transactions, they do not seem to have spoiled her enjoyment in the very least. Her various experiences during a six years' stay in the Eternal City are told with vivacity and a keen sense of humor which make pleasant reading. The book will also be found of some practical use to travellers who mean to keep house in Rome, for it contains much information the guide-books do not give about house-hunting, manners, customs, domestic arrangements, roof gardening (which is such a joy in the summer to those who have to spend the hot months in the city), and many primitive methods still in vogue relating to the washing of clothes and cooking, the price of fuel, and the ways of the Roman servants, cab drivers and other hangers-on to every foreign apartment-holder. All these details are blended into the narrative of the author's daily life in conversations in the popular dialect given in the original and translated—a cumbersome method of imparting local color.

The book tells further of exciting events which do not often fall to the share of the ordinary traveller, such as a visit to Queen Margaret on the occasion when Mrs. Potter Palmer and Maud Howe had an audience with her Majesty, who was interested in their work in the woman's department of the World's Fair; and, later on, the Queen's visit to Mr. Elliott's studio to see his decoration for the Boston Public Library just before it was completed—a very unusual event, as the royal family rarely visit the Borgo, the quarter of the town surrounding the Vatican in which the studio was. The description of the hurry and excitement which the sudden announcement of the impending honor entails, gives a very good idea of how those things are done in Rome, where simplicity and ceremonial are so singularly blended. Maud Howe goes back to earlier recollections of Rome to tell us of a presentation to Leo XIII. in 1878, on which occasion Protestant and Jewish visitors were more favored by his Holiness than those of his own flock. Several chapters relate to summer excursions in the Abruzzi mountains—and to the sea at Ischia and Viareggio.

The illustrations are eminently perfunctory.

Pedagogues and Parents

By ELLA CALISTA WILSON

$1.25 *net* (by mail $1.37).

N. Y. Times Review: "A thoughtful and suggestive little book; one, moreover, so rich in apt quotation, so sparkling, and so original that the reader cannot fail to be fascinated. . . . A plea for that much-neglected entity in education, the individual, and that equally neglected quality, common sense. . . . It is full of practical suggestion, and of delightful iconoclasm. . . . We wish, not hope, that this delightful little volume, more entertaining than nine-tenths of the fiction of the day, might speedily be enrolled among the 'best selling books.' Its happy tendency is to make parents of pedagogues and pedagogues of parents, and when that is achieved the ideal republic will have begun."

N. Y. Tribune: "The book is written in a lively fashion that compels attention to serious and acknowledged defects in our school system, and is brightened by many apposite and humorous anecdotes and instances . . . We can heartily recommend it to parents and teachers as an entertaining and suggestive contribution to a subject which should be of vital interest to every person concerned in the education of the young and in the future welfare of our country. For one thing, the book is simply written and not overweighted with the cumbrous terminology of most works on this subject."

Full particulars and descriptive circulars will be mailed on application to

THE ARTHUR H. CLARK COMPANY
Publishers, Cleveland, Ohio.

Early Western Travels
1748-1846

A SERIES OF ANNOTATED REPRINTS of some of the best and rarest contemporary volumes of travel, descriptive of the Aborigines and Social and Economic Conditions in the Middle and Far West, during the Period of Early American Settlement.

Edited with Historical, Geographical, Ethnological, and Bibliographical Notes, and Introductions and Index, by
REUBEN GOLD THWAITES, LL.D.

With facsimiles of the original title-pages, maps, portraits, views, etc. Each volume, large 8vo, cloth, uncut, gilt tops. Price $4.00 net per volume (except the Atlas, which is $15.00 net). The edition is limited to 750 complete sets, each numbered and signed; but in addition thereto, a limited number of the volumes will be sold separately.

An Elaborate Analytical Index to the Whole

Almost all of the rare originals are without indexes. In the present reprint series, this immense mass of historical data will be made accessible through one exhaustive analytical index, to occupy the concluding volume.

"The century that sets the bounds of this work is the most important and interesting in the history of the 'winning of the West'; . . . it is comprehensive, and the materials at the disposal of the editor assure a collection that will be indispensable to every well equipped public or private library."—*Public Opinion.*

"An undertaking of great interest to every student of Western history."—*The Dial.*

Full descriptive circular and contents of the volumes will be mailed on application.

Publishers, Cleveland, Ohio.

THE CLARENDON PRESS

SHAKESPEARE.—Facsimile Reproductions of the Portions of Shakespeare Not Included in the First Folio

Each volume has been printed by the collotype process from the finest accessible copy of the original issue, and, except in point of size, is of similar character to the collotype reproduction of the Shakespeare First Folio which the Delegates published in 1902.

This series of reproductions has been executed under the superintendence of Mr. Sidney Lee, who will embody in full introductions the latest results of his researches regarding the bibliographical history of each of the four volumes of Shakespeare's poems and of the play of Pericles.

The five facsimiles have been printed on paper supplied by the O. W. Paper and Arts Co., the size being 10 in. by 8, i. e. post quarto. They will be issued in two forms, and four styles of binding, as follows:

(a) *In five separate volumes*, in real vellum, with kid leather ties (*the precise form of the original binding*), *at $50.00 net the set. The volumes are not sold separately.*

(b) *In five separate volumes*, in paper boards imitating vellum, with ties, *after the original manner of binding, at $30.00 net the set. The volumes are not sold separately.*

(c) *In a single volume*, in rough calf, *as used for the First Folio facsimile, at $35.00 net.*

(d) *In a single volume*, in paper boards, *as used for the First Folio facsimile, at $25.00 net.*

[*The number of copies printed, of which only a portion now remains unsold, is limited to 1,250, of which 250 are for America. All copies will be numbered, and* Venus & Adonis, *the first volume of each set, will be signed by Mr. Lee.*]

VOLS. IX-XII NOW READY.

THE LETTERS OF HORACE WALPOLE

Fourth Earl of Oxford. Chronologically arranged and edited by Mrs. PAGET TOYNBEE. Contains 400 letters not included in the Latest Edition of the Collected Letters, 100 of which have never before been printed. With additional Notes, full Analytical Index, 50 Photogravure Illustrations, and 3 Facsimiles of Original Letters. To be completed in 16 volumes.

I. Demy 8vo. Special Limited Edition, printed upon hand-made paper, 16 volumes. Bound in boards, with paper labels, $175.00 *net*, per set. Bound in full straight grained genuine morocco, $225.00 *net*, per set.

II. Crown 8vo. Oxford India Paper Edition, in 8 double volumes, cloth, gilt edges, $5.75 *net*, each, or $46.00 *net*, per set.

III. Crown 8vo. Ordinary Paper Edition in 16 volumes, cloth, gilt top, $2.00 *net*, each, or $32.00 *net*, per set.

THE COMPLETE POETICAL WORKS OF SHELLEY

Including Materials never before printed in any edition of the poems. Edited with Textual Notes and Bibliographical List of Editions by THOMAS HUTCHINSON, M.A. Demy 8vo, with the Bodleian portrait of Shelley and two other collotype illustrations. Cloth, uncut, paper label, $2.50. Cloth, gilt lettered, $2.50.

DANTE'S DIVINA COMMEDIA

translated into English Prose by H. F. TOZER, M.A. Extra fcap, 8vo, uniform with Dean Wickham's Translation of *Horace*, &c. Cloth, $1.00.

ENGLISH MEDICINE IN THE ANGLO-SAXON TIMES

The Fitz-Patrick Lectures, delivered before the Royal College of Physicians in London, June 23 and 25, 1903. By JOSEPH FRANK PAYNE, M.D. Oxon., Fellow and Harveian Librarian of the College of Physicians; Fellow of the University of London; Consulting Physician to St. Thomas's Hospital; sometime Fellow of Magdalen College, Oxford. Demy 8vo, cloth, with twenty-three illustrations, $2.90.

THE PREPARATION OF THE CHILD FOR SCIENCE

By M. E. BOOLE. Crown 8vo, cloth, uniform in size, binding and price with Mrs. Boole's Logic of Arithmetic, 50c.

ALSO PUBLISHED BY HENRY FROWDE

CHAUCER.—Facsimile Reproduction of the First Folio of Chaucer, 1532.

Edited, with Introduction, by the Rev. Professor SKEAT, Litt.D., etc.

A Collotype Facsimile of the collected edition of Chaucer's Works (together with many Chaucerian pieces) edited by W. Thynne and printed in the year 1532, is about to be issued.

The copy to be used as the original for this reproduction is that in the British Museum Library. It is taller and in better condition than the Bodleian copy, and is complete.

The edition will be limited to 1,000 copies, of which the greater number have now been subscribed for. The price will be $50.00 net bound in Antique boards, or $60.00 net, in rough calf.

GERMAN POPULAR STORIES

Collected by the BROTHERS GRIMM. Two Volumes, bound in picture boards with Cruikshank's Illustrations, $10.00 net.

This is a reprint of the earliest English form of these fairy stories, and it contains all the illustrations by George Cruikshank which appeared in the First and Second Series as originally published in 1823 and 1826, respectively.

THE TRAGEDIES OF SENECA

Rendered into English Verse by ELLA ISABEL HARRIS, Ph.D. (Yale). Crown 8vo, cloth, $2.00.

THE FACE OF THE EARTH (Das Antlitz der Erde)

By EDUARD SUESS. Translated by Hertha B. C. Sollas, Ph.D., under the direction of W. J. Sollas, Sc.D., LL.D. (Prof. Suess has written a special preface for the English translation.) Vol. I., with 4 maps and 50 other illustrations, $8.35.

THE EARLY HISTORY OF INDIA

From 600 B.C. to the Muhammadan Conquest, including the Invasion of Alexander the Great, by VINCENT A. SMITH. With maps and illustrations. 8vo, cloth, $4.75.

MURRAY'S SMALL CLASSICAL ATLAS FOR SCHOOLS

Edited by G. B. GRUNDY, M.A., D.Litt., Folio (14¼ x 9¾ inches). $1.50.

The Maps in this Atlas incorporate the results of recent scholarship, and have been most carefully prepared so as to accentuate all the chief names and natural features of the countries, and by eliminating those of minor importance to avoid overcrowding. The use of color contours, whilst displaying the configuration of the countries at a glance, enhances the effect of simplicity, which cannot be achieved in maps where the old-fashioned method of hachured mountains obscured the names.

THE SACRED HYMNS AND THE NAPOLEONIC ODE OF ALEXANDER MANZONI

Translated in English Rhyme. With Portrait, Biographical Preface, Historical Introductions, Critical Notes, and Appendix, containing the Italian Texts, by Rev. JOEL FOOTE BINGHAM, D.D., L.H.D. Crown 8vo, cloth, gilt top, $3.00 net.

FRANCESCA DA RIMINI OF SILVIO PELLICO

From the Italian, by the Rev. J. F. BINGHAM, D.D., L.H.D., lecturer on Italian Literature, Trinity College, Hartford, Conn. Fifth Edition. Illustrated, $2.00.

For Sale by all Booksellers. Send for Catalogue

The Common Lot

Sixth Edition *Cloth, $1.50* is published by

THE MACMILLAN COMPANY, 66 5th Ave., New York

The Nation.

NEW YORK, THURSDAY, JANUARY 12, 1905.

The Week.

The patriotic Senate, fearful lest harm befall an innocent President exposed to the wiles of wicked foreigners, wants the arbitration treaties to provide that each particular case of dispute shall be submitted to its omniscience. In short, we shall agree to arbitrate whenever it pleases the wisdom of the Senate to arbitrate. All this would leave us in exactly the position which we now occupy. The treaties are intended to bind us to a form of legal procedure, and thus to steady the Executive and Congress against gusts of popular passion. The Senate, however, insists on its right to indulge in bluster whenever such a course seems popular, and for the luxury of cheap swaggering would cheerfully emasculate the treaties. It is part of the old and settled Senatorial policy of encroachment upon the rights both of the lower house and of the Executive. The appointing power is nominally vested in the President, with the approval of the Senate; but the theory of "Senatorial courtesy" is to vest it in the Senate, with the approval of the President. The attitude of the Senate toward treaties is meant to make the Secretary of State a mere clerk of the Senate Committee on Foreign Relations. These pending treaties, Mr. John W. Foster notes in an article in the *Independent*, "fall far short of the desire of the ardent friends of arbitration." Nevertheless, the Senate would nullify them in order to glut its greed for power.

There will not be another Charleston earthquake as a consequence of the confirmation of Dr. Crum as collector of that port. Now that the unavailing struggle to prevent this intelligent and dignified negro from holding office is over, we think those responsible for all the sound and fury evolved must be a trifle ashamed. None of the dire things they predicted has come to pass or will come to pass. The social system of the South has not been torn asunder, nor will it be. All that has happened is that a competent, educated, and self-respecting man has been given a Federal office, and that the color of his skin was not held to be sufficient of itself to shut him out of it. Yet the President, in his efforts to combine the policy of the open-door of advancement for worthy black men with the plan of recovering his personal popularity in the South, should be under no illusions. The South is willing to have him make love to her, but she is notifying the suitor in advance upon what terms she will insist. Thus, the Atlanta *Constitution* expresses a readiness to resume amicable relations with the President, but tells him frankly that he cannot be regarded as a friend by the South "if the negro is to be thrust into official position to serve white people." Either Mr. Roosevelt or the South will have to retreat; that is plain.

It looks as if the future historian would have a chance to dub the coming Roosevelt Administration "the era of warm-heartedness." Here is the case of Mr. Cortelyou. He was to have been made Postmaster-General immediately after the election, but the untimely death of Mr. Payne and his own engagements as National Chairman made it necessary to postpone the honor. Now, after a few months' waiting, the way is prepared to the higher post of Secretary of the Treasury. But Mr. Cortelyou was once a clerk in the Post-Office Department, and has since cherished the natural ambition of the boy in the story-book to come back as the head of the establishment where he served his apprenticeship. It is a sentimental consideration, but was it not sentiment that put Mr. Roosevelt into the Presidency? At all events, Mr. Wynne is to retire on March 4, and Mr. Cortelyou to administer the office for three months until he passes to Mr. Shaw's desk. It is as pleasant and human a story, all around, as has come from official life in a long time, and shows how far we are from having a cold-blooded bureaucracy at Washington. Yet the practice should not be made a precedent. Mr. Cortelyou was also, at one time, executive clerk at the White House, but that would hardly be a sufficient reason for giving him the Presidency.

There are conflicting reports touching Mr. Paul Morton's position. He has explained things to the President, and all is well. But he also has not explained, and all is not well; the Republican leaders are reported to be getting very nervous over the situation. Mr. Morton's case has certainly not been strengthened by Representative Baker's offering a resolution respectfully inquiring whether Mr. Morton's retention in the Cabinet is conducive to the public interest and in harmony with Mr. Roosevelt's last message. But what will hurt him still more is the revival of his testimony before the Interstate Commerce Commission in Washington on December 19, 1901, when the present Secretary of the Navy said, in reply to a question: "Yes, sir, it was an illegal contract. It was illegal when we made it, and we knew that." Whether Mr. Morton can still be punished for this violation of the law, is open to question. But there is no gainsaying the fact that Baker has put Mr. Roosevelt in a very awkward fix. One who has been so vigorous in enforcing laws from the time he was Commissioner of Police in this city to the present day, cannot be pleased to find at his council table a confessed violator of the law. Young men who "do things" are, of course, desirable adjuncts to a strenuous Cabinet, but sometimes it is well to find out in advance just what they have done.

The letters on tariff revision which the *Evening Post* has been printing for the last three weeks reveal at least the strong sentiment which exists among intelligent Republicans in favor of correcting the abuses under the present tariff law. Five out of six, in round numbers, of the Republicans whose letters have thus been published from day to day want the tariff revised. A canvass shows that only about one Republican in eight is not in some measure a tariff-reformer. Among 183 Republicans, only fifteen gave an unqualified "No" in answer to the question, "Do you favor tariff revision?" In fact, some of the men who began by stating that they did not believe in revising the tariff, practically took back that answer in the next line by naming schedules which they wished to see amended. It is rather hard to derive from this showing any confirmation of the notion that Mr. Roosevelt's overwhelming victory was a mandate to let the tariff alone. Under our political system the party in power is, of course, privileged to ignore the demand of fourteen Democrats out of fifteen that the tariff be reformed, or even the wish of nine out of every ten men whose names are taken from a recognized list of men of achievement in all departments. But the voters who placed their confidence in Mr. Roosevelt and helped him to the highest office in the land, have a right to be listened to.

The voice of protest against the candidacy of two unfit men for the United States Senatorship from Connecticut has not yet been smothered. The political, social, and financial power of Fessenden and of his rival, Bulkeley, president of the Ætna Life Insurance Company, has muzzled most of the newspapers of the State. Relatively few of them, Republican or Democrat, dare to speak out and put these two men where they belong—in the pillory. But the leader of the movement for decency, the Rev. Dr. Newman Smyth, continues his course inflexibly, and there is hope that the protestants, with such a candidate as

Representative E. J. Hill, may hold the balance of power between contending corruptionists. But should both Fessenden and Bulkeley fail, the blessed result will apparently be due more to their quarrels with each other than to the zeal of the press and aroused public spirit.

After the sort of news that we are accustomed to reading from Colorado, it is decidedly startling, though none the less pleasant, to learn that the disputed election for Governor is to be settled in the regulation, common-sense way. That is to say, the Democrat who has an unquestioned plurality, according to the returns as sent to the Legislature, has been inaugurated, and his Republican opponent will make a contest. The allegations of Democratic fraud in Denver being met by charges of Republican fraud in Pueblo and elsewhere, the investigation may closely parallel the previous court proceedings. According to the last score we have seen published, the Democrats have succeeded in putting several more Republicans in jail for election frauds than the Republicans have incarcerated Democrats for contempt of court. The action of the Supreme Court in throwing out the vote of whole precincts in Denver, even though the fraudulent votes could be perfectly identified in the ballot boxes, continues to be discussed. One clever cartoon makes the cashier of a bank say, "I am afraid there is a counterfeit bill in this package, so I must burn the whole lot." The Republicans reply that it would be unjust merely to subtract the fraudulent ballots, as there would then be left all the legitimate Democratic votes, while a good share of the lawful Republican vote was scared away or cheated out of registration. Like all election contests, the question is exceedingly complicated. Still, Saturday's action seems to show some return in Colorado to the old notion that an inquiry into the facts should precede the decision of a case.

In Gov. Pennypacker's periodic discussions of the liberty of the press, nothing is more happy than his choice of illustrative anecdotes and striking precedents. Two years since, in his rôle of historical student, he remarked that one hundred years ago such conduct as that of the Philadelphia cartoonists was punished by chopping off the offender's head and displaying it on a pole. He did not say, in so many words, that he endorsed this treatment, but it was hard to escape the inference. Just so in his message of January 3. "What is the remedy?" he asks, after deploring the state of the Pennsylvania press. "Sooner or later one must be provided. Recently, in one of the States, an offended citizen shot and killed an editor." Pennypacker's own suggestion is that an offending journal should be suppressed by the State authorities as a public nuisance. The amiable dragon which typifies "Graft" and has been portrayed as having at least a calling acquaintance with Mayor Weaver, seems to have incensed the Governor as much as did the parrot bearing his own likeness, or the ungainly cats which represented Mr. Pusey, the author of the bill which forbade the use of "unhuman animals" in cartoons.

The Massachusetts Legislature assembled last week with one of its members in jail for violation of a Federal statute, and saved itself from an awkward predicament by promptly declaring his seat vacant. Mr. Curley of the Seventeenth Suffolk District was to finish in three days his term of incarceration, and his plan was then to begin his term of office-holding. If Mr. Curley had been elected with an unsullied record and afterwards been caught in wrongdoing, the situation would be clear. But his case was peculiar, in that the Representative-elect was already in jail on election day, and, in fact, carried on his campaign from that building as an office. His constituents decided that violation of the Civil Service law to oblige a friend was no disqualification. If they really want to have a convict represent them, it seems a trifle hard not to let them. One legislator had prepared a bill making convicts ineligible to elective office for five years—a piece of legislation which, but for the special conditions, would have been thought almost unnecessary. But the House preferred to take the shorter cut, and draw the line at convicts.

Vermont is the latest of the States to undertake a systematic investigation of tuberculosis. The Legislature which has just closed its session authorized an extension of the scope of the commission which had been at work for two years inquiring into the prevalence of the disease. It will now be continued as an educating body. The importance of bringing home to the people a sense of their peril is indicated in the programme published by the Vermont physicians: "It shall be a part of the duty of the commission to adopt and make use of means to educate the people of the State in respect to the cause and nature of tuberculosis, and the means that may be taken by the people themselves for its prevention and cure, to the end that the large death-rate from this fatal disease—the largest of all in this State and in all civilized countries—may be reduced to its lowest possible limit." Though able to touch only the fringes of the great problem because of the small appropriation available, the Vermont commission is preparing to hold public meetings in every county in the State, at which lectures will be delivered outlining simple precautionary measures, indicating rational treatment and dissipating foolish prejudices against sufferers from tuberculosis.

Superintendent Kilburn of the State Banking Department signalizes his annual report by explicit recommendation of a law requiring cash reserves to be held against trust-company deposits. Mr. Kilburn first refers to the effort of the New York Clearing House, two years ago, to enforce such a requirement by the refusal of check-clearing facilities to trust companies except such as should, at certain stipulated dates, accumulate a reserve to amount eventually to 10 per cent. of their several deposits. The upshot was that practically all the trust companies voluntarily withdrew from the Clearing House. Mr. Kilburn now advises that the Legislature amend the law so as to require of trust companies a reserve—15 per cent. for New York city institutions, one-third of which must be in cash, and 10 per cent. for others, one-half of it being cash. In other words, an absolute uniform requirement of 5 per cent. cash on hand against deposits is recommended. This is a mild application of the law; the New York trust companies, in their statements of last June, showed cash holdings footing up, on the average, only 3⅝ per cent. of deposit liabilities. Furthermore, at the height of that very dangerous speculative period, 1901, the average cash reserve of all the trust companies in this State was but 1¾ per cent. The proposed 5 per cent. reserve is less than State banks in the larger cities have to hold; from them is required a total reserve of 15 per cent., of which half must be cash on hand.

On the retirement of Mr. Henry Rutgers Marshall and President John De Witt Warner from the Art Commission, the Mayor has appointed Mr. Walter Cook, the well-known architect and critic, and Mr. Robert W. De Forest, who has shown a public-spirited interest in many of our local art organizations, particularly the Metropolitan Museum, of which he is a trustee. These selections show that Mr. McClellan desires to maintain the high character of the Commission and to keep it an efficient part of the city government. Nothing else, of course, was to be expected from a man of Mr. McClellan's taste, but it is well to note, also, that the successors of members as active as Messrs. Marshall and Warner—who, one may say, were virtually the founders of the Commission—are also men who will take their function seriously. The Commission has already proved its usefulness in vetoing unworthy plans and sites for civic buildings; it is the only official organization that has any jurisdiction over the public art of New York. Unless

it is efficient, the various active volunteer bodies who are working for a more beautiful city will largely waste their toil. Moreover, while the Commission has made good its position, the extent of its powers is yet to be worked ou' in practice. Accordingly, the Mayor deserves everybody's thanks for appointing two gentlemen whose names will adorn the Commission, while their services will undoubtedly strengthen all its operations.

The case against Bishop Ethelbert Talbot has apparently fallen to the ground by the withdrawal of signatures from the presentment. This result puts the other protagonist of the controversy, the Rev. Dr. Ingraham N. W. Irvine, in an unfortunate position, because the signers now allege that their names were obtained by misrepresentation. Bishop Talbot cannot be happy, for in the mind of the public he is suspected of conspiring with a divorced woman to drive Dr. Irvine from the Episcopal Church. Bishop Talbot ought, for the sake of his own fair fame and that of the church in which he is a leader, to press for an impartial and searching inquiry that shall finally settle the question whether he is a colossal liar or Dr. Irvine is a hypocrite. A clergyman's reputation, like a woman's, should be above suspicion. At present, both the bishop and the unfrocked priest are dogged by whisper and innuendo which go far to counteract their utterances and undo their labors. A criminal's reasons for wishing to smother investigation and escape on a technicality are evident; but an honest man wronged by unjust charges must court the fullest publicity or submit to the natural inference.

The marvel of Mr. Carnegie's library gifts is thoroughly familiar, but Mr. Horace White's statistics, presented in his opening address at the Beloit College library, on Thursday, bring out the old facts with renewed force. It will be surprising to many people, for example, to learn that Mr. Carnegie has established nearly as many libraries in England and her colonies as he has done in the United States. His native Scotland is more liberally supplied than any other large district, excepting only New York State, 55 per cent. of whose population may, if they will, use Carnegie libraries, as compared with 43 per cent. of the Scotch population. Of the more populous English-speaking divisions, only Alaska, Arkansas, Delaware, Mississippi, Rhode Island, Australia, British India, and the Cape have failed to profit by Mr. Carnegie's liberality. There could be no surer indication that his plan has corresponded to an urgent need. As for the criticism that libraries are temptingly offered to communities too poor to afford them, the choice lies in the hands of every town, and we have yet to hear of a town wrecked by a literary rake's progress under Mr. Carnegie's incitement. That the libraries frequently circulate trash is true enough, but, as Mr. White well said, within the bounds of morality a public library can hardly do anything else than give people what they want to read.

Evidently there should be written a new chapter on the uses of an ally. England is, of course, our warmest friend in Europe, bound to us by blood which is guaranteed thicker than water, and, above all, by that dear old oratorical commonplace, a common language. Yet we learn with surprise that this highly cherished ally, not to be outdone by our naval Board of Construction, is going us one better in the matter of battleships. Her Admiralty has designed a vessel which will carry ten 12-inch guns, and will be capable of destroying anything afloat or designed. Lest we Americans mistake the import of this action, a London newspaper informs us that this is merely Great Britain's reply to our latest battleships, "in friendly competition." The step is undeniably friendly to our shipbuilders and naval constructors, for it will now be their duty—purely as a matter of "friendliness" to our ally, of course—to outdo her by devising a ship of 500 tons greater displacement than this new terror of the seas, and capable of carrying two more 12-inch guns. England can then again show her friendliness by designing a still more formidable ironclad, merely for the purpose of fighting by our side some day, or rather in behalf of the Anglo-Saxon race. This is the most delightful game we know of, and the best part of it is that if an ally lags behind, one or two putative enemies will do quite as well as partners in the sport.

No wonder that the English Liberals are busy framing the next Government. Every bye-election shows how strongly the tide is running against the Balfour Ministry. On Saturday the Conservatives lost a seat at Stalybridge, the Liberals winning by a thousand votes. As it happened, the Board of Trade returns for December, and for the entire year 1904, were published on the same day, and showed how absurd is the Chamberlain contention that England is being rapidly ruined by free trade. Ruin on the terms of an increase of about $100,000,000 in foreign commerce is not so black as it is painted. It was noted in the last speech made by Mr. Chamberlain that he did not quote a single figure. Mr. Asquith commented upon the fact satirically, and asked if there were to be no more statistical demonstrations of the havoc wrought by free trade. The Board of Trade, however, has furnished the missing figures. They are as eloquent in their way as the poll at Stalybridge. Both of them show what good reason the Conservatives have to dread a general election.

Nothing has become the present Hungarian Parliament like its taking off. The Opposition has distinguished itself by obstructionism almost unparallelled for rowdyism; Premier Tisza has been forced to strain the Constitution in order to maintain even the semblance of a law-making body. The Government and the Opposition go before the electorate with little credit on either side. The appeal is hardly to principle. Vague enthusiasts for Magyar independence will vote with Kossuth; prudent believers in the compact between Austria and Hungary with Tisza. The Independence party has, however, gained a valuable ally in Count Apponyi, a vigorous debater and party leader, who seems rather moved by indignation at Premier Tisza's drastic measures of parliamentary discipline than by any zeal for the idea of an independent Hungary. It is assumed that the Premier has the unqualified support of the Emperor-King, and will be able to present himself definitely as the champion of the Dual Monarchy. But it will be very difficult to get a clear mandate on this issue from the voters. The electoral system is so perversely complex as to make a vote anything but the rendering of a popular verdict. Furthermore, the merely personal vote is large; that based on uncompromising Magyarism still larger. In short, about the only hopeful feature of the Parliamentary situation in Hungary is the generally conceded fact that a new House of Deputies can hardly be more ineffectual than the last.

To detect political meaning, primarily, in the resignation of Prince Mirsky, whose portfolio of the Interior M. Witte is reported to be about to assume, is difficult. Both are liberals. Witte presumably is of a more prudent and calculating mind, as befits an ex-Minister of Finance. Prince Mirsky, according to varying accounts, is either offended at the reprimand to zemstvo agitation with which the Czar's rescript was accompanied, or frightened by the spectre of Constitutionalism which he himself has evoked. It is pretty well established that the general and guarded form which the reform ukase finally received was due to M. Witte, Prince Mirsky desiring concessions in the direction of an Imperial Parliament. It seems likely, then, that Mirsky goes for having manifested *trop de zèle*—and hence for reasons very largely personal—and that the projected reforms will come about gradually under the cautious direction of Witte, whose allegiance to progressive ideas is unquestioned.

THE PROGRAMME.

The conference on Saturday between President Roosevelt and the Republican leaders in Congress did little but report progress—backwards. Nothing is to be done the present session. Those whose strength is in sitting still, are in control. No tariff changes, no railway-rate regulation, no general legislation of any kind, will be attempted this winter. The proposed extra session of Congress in the spring is to be abandoned. A policy of stand pat all round will prevail. Such is the net result of the bruited conference which was to agree upon a legislative programme. It is said that there are to be further conferences, but the more they confer, the more things will remain unchanged.

Mr. Roosevelt elaborately disavowed any intention to dictate to Congress. It was simply for information that he rose. To consult party sentiment was his only desire. What the managers thought the wisest course was all he wanted. But these are only conventional and hollow phrases. Everybody knows that the President has measures near his heart. Everybody knows that he is doing his best to persuade Congressmen to take up his views. He may not openly assert his power; but the astonishing conversions already recorded are proof that Representatives and Senators secretly feel his sway. Jupiter does not ostentatiously demand sacrifices; but somehow an evil disease attacks the man who refuses to bring an offering, or a murrain falls upon his cattle. Similar are the workings of Presidential disfavor. Mr. Roosevelt would never think of dictating to Congress. He simply, after earnestly instilling certain ideas of his own into the minds of influential leaders, asks them to come in a body and restate the matter as if it originated with them. In so far, his method is not unlike Odell's famous way of going to work to "collect the sentiment of the party."

The upshot as to tariff revision is, that a gentleman's agreement has been made to begin that work in an autumn session of Congress. During the interval, the really wise and great "friends of the tariff" will ponder over the true number of thirty-seconds to cut off, in answer to the Hamlet cry, "Oh, reform it altogether!" Even this delayed beginning of an urgent work is conceded grudgingly. Messrs. Platt, Cannon, Dalzell, and Grosvenor state that their personal conviction is wholly against the necessity of touching the tariff at all. Still, they say with fine magnanimity, since it is apparent that the country wants it—the proof being a "sudden and unexpected agitation"—it is "advisable to meet the wishes of the people and grant them the concessions which seem to be desired." Thanks, gracious sirs! We know that we are foolish children crying for tariff candy that will give us colic, but it is so kind and condescending of you to give it to us. Only, we beg, do not repeat your gift of 1882, when you promised to cut down the tariff but really raised it, and then, when hard times followed, turned on us reproachfully and said: "Now you see what comes of interfering with protection!"

That the President sincerely desires the undoing of at least the grossest tariff outrages, we have no doubt. But does he desire it so intensely as he does certain other things? Some of the leakings from the conference make us a little doubtful on that point. Mr. Roosevelt assents to the deferring of tariff revision, but against the proposal to retrench in naval expenditures he sets himself firmly. That part of his programme he regards as vital. To him, the voting of one battleship instead of four, and two cruisers in place of seven, would seem a sort of leze-majesty and high treason combined. Has he not himself declared it necessary to the peace of the world to have a navy big enough to be a constant threat? If he is told that the Treasury is running too low to afford such luxuries, he replies that he sees clearly the need of keeping down expenses—only it must be the other fellow's expenses, not his. The question is if as stiff a fight for tariff reform as the President is making for swollen armaments would not have left him something better than his fine array of delays and uncertainties.

Of two things, we think, he may rest assured. One is that his opponents in Congress will resort to every subterfuge and dilatory measure to thwart him or any other tariff reformer. Their motto is, "We and time and the rules of the Senate against any two Administrations." We are freshly reminded of what can be arrogantly done in that line by Senator Teller's calm notification that he will not allow the Statehood bill to pass. A tariff bill next October or next December may encounter such a Senatorial veto. What is certain is that one delay invites another, and that, the standpatters, having drawn first blood in disposing of the spring session, will press on to make the autumn session barren if possible. And President Roosevelt ought not to count too much or too long upon his "tact" in using his party machinery for the public good. His appeal to party loyalty will steadily diminish in force as his term progresses, and as the plans to nominate another man in 1908 are perfected. Mr. Roosevelt undoubtedly accomplished surprising things in his first term by persuading the party to fall in behind him; but then he was the predestined candidate. The case will soon be very different with him, and we fear he will find, to his disappointment, that he has not at hand that "constant service of the antique world" which "sweat for duty, not for meed." All the greater reason, then, for his striking hard and boldly for the causes he holds dear, before the authority derived from his remarkable endorsement by the people shall have grown pale and dim.

THE LAND FRAUDS.

The reports that there have been extensive frauds in the Government land offices of Oregon and Idaho will surprise no one who has even a casual acquaintance with the commerce and politics of the Pacific Northwest. The astonishing thing is that operations in which prominent politicians (and, in all probability, large corporations) are involved should be investigated by officers of justice. Putting in the probe has demanded more energy and courage than most Eastern men suppose; and praise for fearlessness should be heartily accorded to both Secretary Hitchcock and President Roosevelt. In removing a United States District Attorney and pressing for an indictment against Senator Mitchell and Representative Hermann, they have encountered the bitter hostility and dared the wrath of strong social, political, and financial interests. For in that part of the country the land question, as it is sometimes called, is one phase of the eternal struggle between the corporations and the people.

The avowed policy of the Federal Government has been to keep the public lands from falling into the clutches of corporations, to prevent monopoly, and to give every man a chance at the soil. This idea is not only popular, but just. The corporations, however, are always aiming to secure large holdings: they want huge tracts of the best farming lands; the rival lumber companies are scheming for the largest acreage of the finest and most accessible timber; combinations of contractors have plotted to seize long ridges of choice building stone; coal operators wish to extend their possessions; and the machinations of the copper miners to obtain the most valuable deposits have made Montana politics a synonym for corruption.

In order to preserve the rights of the individual, Congress has passed exceedingly stringent laws for the distribution of land. The person who takes up a homestead, for example, must reside upon or cultivate the tract for five years, and he must swear that he is "not acting as agent of any person, corporation, or syndicate," or "in collusion with any person, corporation, or syndicate, to give them the benefit of the land entered, or any part thereof, or the timber thereon," and that he is not engaged in the enterprise "for the purpose of speculation." All this before a clear title can issue. The applicant for mineral lands must take a similar oath, and he must expend five hundred dollars in improvements on the claim. Stone and timber entries, under specifications suit-

able for the nature of the land, are guarded with equal care. It is against these strict provisions that certain corporations have organized a formidable conspiracy.

Their frauds fall roughly into two classes. In the first place, the thieves describe the land wrongly. The difference in price between lands for farming, lumbering, and mining may make it worth while to secure a tract of timber under pretence that it is a farm, or a mine under cover of a timber entry. Sometimes there may be actual doubt as to whether a given section is worth more for farming, lumbering, or quarrying; but if the Government officials are lax, doubts where none exist will be raised and settled in favor of a claimant. In frauds of the second class, the land is correctly described, but the claimants are either speculators or dummies. Many an individual on his own initiative will make entry and commit perjury in the hope of turning an honest penny by the sale of his claim. The process, if the officers of law are conveniently deaf, dumb, and blind, is so simple that the proprietors of a lumber mill in Oregon or Washington will deliberately hire fifteen, twenty, or even more men to take up contiguous claims, which shall later be consolidated in the hands of the company. The concern is thus saved the expense not only of buying in the open market at high prices, but also of operating with heavy and costly machinery on small and scattered tracts. If the registrar of the local land office will mind his own business and not go behind the affidavits, he will usually hear of something to his advantage.

But vulgar bribery is not the only method of swindling Uncle Sam. The more important companies, with hundreds of employees, have intimate connections with banks and mercantile houses of all kind. They are socially and politically an enormous power. In any campaign they can make it clear to a candidate for either branch of Congress that he will alienate them and their friends unless he guarantees men of the right sort in the land offices. The appointees, who can always have the enthusiastic endorsement of the leading men of their region, bankers, lawyers, and even clergymen, understand in advance that they are not to run amuck. The big lumber operators are pillars of State, and as such can do no wrong. To question them or doubt their good faith is to interfere with the divine order of the universe. The United States District Attorneys are early taught the important lesson that they must not ruin local industries and plunge the community into woe. There is, in fact, a tacit understanding among high and low that a patriot will let sleeping dogs lie.

Into this Garden of Eden, a paradise of corruption, the strenuous President has rudely broken with the flaming sword of justice. Oregon, Washington, and Idaho are almost as much shocked as New York would be were men of the unquestioned standing of Senator Chauncey M. Depew and the officers of the New York Central indicted for granting rebates to favored shippers.

"FOR BUSINESS REASONS."

"Why did you violate a statute of the United States?" "For business reasons." Such were, in effect, a question and answer at the Interstate Commerce hearing in Chicago on December 30. The question was put by the Commission to W. B. Biddle, freight-traffic manager of the great Santa Fé Railway. It had first been shown that a rebate had been secretly given by his orders on coal shipped by a certain company to certain points. A copy of the confidential circular to the road's agent had been put in evidence, carefully headed: "This publication is for the information of employees only, and copies must not be given to the public." Here were at least two clear violations of the Interstate Commerce Act, which forbids in terms the granting of rebates under any guise whatever, and directs common carriers to "file with the Commission" all its "schedules, contracts, agreements, arrangements," etc., relating to freight traffic. Reminded of this law, and plumply asked why he had not obeyed it, Manager Biddle coolly replied, "For business reasons." A highwayman might have said the same.

This scandal goes higher. It touches Mr. Paul Morton, Secretary of the Navy. He has been advertised as President Roosevelt's handy man in promoting legislation to regulate railway rates. Yet he now appears as one who defies existing law. The transaction referred to took place in 1902, when Mr. Morton was Vice-President of the Santa Fé, in especial charge of freight traffic. Whether at the time directly responsible or not for Manager Biddle's illegal acts, Secretary Morton approves them now. "What Mr. Biddle did was exactly right, in my judgment," he says. And he adds: "Everybody did just as we did, and they had to or go out of business." So might Dick Turpin defend the taking of purses on Hounslow Heath. He needed them in his business. Yet it was the same Mr. Morton who said in his testimony before the Interstate Commerce Commission in 1900: "I think the corporation should be fined whenever it grants a rebate, and the shipper should be fined and forced to disgorge what he has received." Evidently, Mr. Morton would not fall under Walpole's objection to "good men" in times of emergency, namely, that they "will not go the necessary lengths."

President Ripley of the Santa Fé takes substantially the same attitude as Mr. Morton. He regards it as an outrage that the Interstate Commerce Commission should bring to light such purely private business arrangements. When asked if there had not been a violation of the law, he loftily replied that this was "a matter for adjudication by legal minds." But the plain, every-day lay mind is competent to adjudicate the moral aspect of the affair, and it will see in it an alarming indication of the tendency of men in control of great corporations to consider themselves above the law. Statutes are well enough for the ordinary run of poor devils, but a railway magnate, a giant captain of industry, a vast operator, must necessarily be *supra legem*. Otherwise, as Mr. Morton explains, he would "have to go out of business." The truth seems to be that some of these men feel their power so great that they are arrogating to themselves the divine right of a sovereign to be immoral. They adduce what are practically "reasons of State" for their cool disregard of the laws that bind common mortals. The Machiavellian principle that "a good result" excuses any violation of law or morals, they quietly adopt; along with every defence made of a Napoleon or a Bismarck. Just as a German University lecturer could declare that "the maintenance of the State is superior to every moral rule," so they assume that, in order to "get business," a man may trample on the law and perjure himself like a gentleman. To say that entire truthfulness and scrupulous regard for the law of the land would mean a certain loss of freight, is enough, in their minds, to justify lying and lawlessness.

It is acts such as the Santa Fé's secret rebates, and attitudes such as that assumed by President Ripley and Secretary Morton, which are pushing on the movement for more stringent legislation with irresistible power. "This beats anything I have known during my twenty years and more of service in the United States Senate," said Senator Cullom the other day. He was referring to the flood of letters pouring in upon him every day from Western business men begging for the passage of a law regulating railway rates. We in the East are not so excited. This is partly because we take our cheating in more docile spirit than they do in the West; but more because in the West nearly every farmer and merchant is a shipper, and feels intensely the power of the railroads to ruin him by discrimination. These men are not enemies of property; they are not filled with hatred and envy of the rich; they will not go in for any kind of Socialist propaganda unless driven to it in despair. But they want common carriers to be made to obey the law, and not allowed to plot in the dark to pull down one man or company in order to build up

another. They are thoroughly aroused on the subject, and President Roosevelt can nowhere make a more welcome application of his doctrine of "the square deal." Only, of course, he will have to take the cards out of the hands of Mr. Paul Morton.

On their side, railroad men have no reason to dread a fair measure of regulation. If it restrains them, it will also protect them; and no one can have mingled with railroad managers without having heard them cry out against the special-car companies, and the elevator companies, and the terminal companies which beset them and raid them and torment them with demands for secret and illegal favors. Instead of trying to get on without the law, or in defiance of it, a really far-sighted railroad manager should be glad to have rigid statutes which it would be an advantage all around to live up to literally. When a man like Mr. J. J. Hill comes over to this view, the project cannot be dismissed as either ignorant meddling or disguised confiscation; and, in the end, "business reasons" must tell fatally against the men who really demoralize traffic as well as conscience by their reckless methods. Any business whose honor rooted in dishonor stands, demands attention—even if there result a vacancy in the Cabinet.

OLD SUBSIDY WRIT SMALL.

Senator Gallinger's report accompanying the new ship-subsidy bill is at least a literary success. Never was so brave an attempt made to butter stale parsnips with fine and freshly devised words. The terms "subsidy" and "bounty" are avoided as if the plague lurked in them. "Subvention" the wise it call, or eke "payment." And a curious felicity in inventing novel phrases to cover up familiar jobs marks the play of Mr. Gallinger's fancy. Steamships which their owners are paid by the Government to build and operate have unpleasant associations; but now, it appears, we are to say, "our marine delivery wagons." That makes all clear—plain sailing, as it were. Every country storekeeper, however opposed he might be to paying money out of the Treasury to the Shipping Trust, is expected to see at once the need of setting up delivery wagons to carry our goods to market, lest, as the report elegantly observes, we "smother at home in our own prosperity." So, too, we learn that a subsidized steamship is rightly to be regarded as "a floating factory," or as "a locomotive and a steel bridge wrought together." Few suspected Senator Gallinger of having such command of "the hoight of foine language intirely."

When all his flowers of rhetoric and his special pleading are brushed away, however, we find a vicious idea underlying them, namely, that of making a private business pay by vote of public money. Disguise it as the report may try to do, that is the principle upon which the bill goes. Obviously, the argument is just as sound for any other business as for that of shipping. At least, any industry or means of transportation involved in the production of goods destined for foreign commerce is as much entitled to subsidy as the steamship. The farmer's wagon that hauls the wheat to the railroad is as deserving of a subvention as one of Mr. Gallinger's marine delivery wagons that carries it across the ocean. Capt. Mahan has written hopefully of the time when American shipping will again "pay"; the report starts off by assuming that it never can be made to pay unless the Government makes up the recurring deficits.

The report abounds in unconscious self-contradictions. It says that the high cost of materials in this country, combined with high wages, makes it impossible to compete with foreign nations in shipbuilding. Yet it admits that we can compete in locomotive-building and bridge-making, though the same alleged causes of inferiority are operative in those industries; and is not a steamship merely a locomotive and a steel bridge wrought together? The report dwells upon the present depression in American ship-building as if it were due to foreign competition; ignoring the fact that our yards were crowded with business two or three years ago, when foreign shipwrights were also busiest, and that the depression is now world-wide. Elsewhere, it is true, the report speaks innocently of the "period of dulness which alternates with activity in shipbuilding," and which now "prevails in England." As for the wages argument, it is employed on different pages of the report with delightful inconsistency. Nowhere do we find a really scientific comparison of wages on the score of efficiency of labor.

But the most glaring fallacy of the report and of the accompanying bill is the contention that the present laws leave American shipbuilding without protection. We carefully protect every other industry, laments the report, but leave our shipping industry exposed to the full fury of foreign competition. But the reverse is the truth. Shipbuilding is the most completely protected of all American industries. Foreign imports in that line are not merely taxed; they are absolutely prohibited. An American citizen cannot buy a steamship abroad and sail it under his own flag or engage with it in our coasting trade. This is the very acme and perfection of protection. It is as if American steel-makers had not simply their $7 a ton duty, but were able to get a law enacted that no steel whatever could be imported. Shipbuilding really enjoys protection *in excelsis*. The idea was to force Americans to buy home-made ships. The result has been that they have gone without, just as they would go without bananas if all were shut out except the $2 apiece brand grown in American hothouses for Americans. What we truly have in the Gallinger report is a confession that the most thoroughgoing system of protection imaginable has abjectly failed, and that resort must now be had to direct bounties.

The bill itself is hardly worth while discussing in detail at the present time. It is admitted at Washington to have no chance of passing in this Congress. When every effort is necessary to keep down appropriations, it is highly improbable that a gratuity will be voted to shipowners. It is doubtless in view of this situation that the present demands of the bill have been whittled down to the lowest terms. "Ocean greyhounds" are omitted. There is a fine flourish about securing a naval militia of daring American seamen, but the crews of the subsidized vessels are required to be only *one-sixth* American, and the best the report can promise is 3,000 men, as against the 20,000 which the Navy Department says is imperatively needed. For two admissions we thank Senator Gallinger. One is his frank confession that the law ostensibly allowing the free import of materials used in shipbuilding has never had any practical effect; and the other is the statement that American steelmakers furnish foreign shipbuilders plates at from $8 to $10 a ton cheaper than they sell at home. This the Gallinger report calls "an unjust and intolerable burden," but it lisps not a syllable about removing tariff duties behind which such outrages shelter themselves.

GOV. HIGGINS'S MESSAGE.

The first message of Gov. Higgins suggests no revolutionary reforms, no such changes in the organization of departments as Gov. Odell set on foot four years ago. The document is, as people expected it would be, clear, direct, and business-like.

The most important problem for the incoming administration is keeping expenditures below receipts. In the first place, the total appropriations in force October 1, 1904, are $2,319,222 more than the income; and the Comptroller estimates that under existing laws the revenue for the present year will be less than that of last. For one thing, recent decisions by the Court of Appeals will reduce the taxes from certain corporations and compel the return of money already collected. If the savings-bank tax is repealed—as Gov. Higgins in accordance with his preëlection promise recommends—$720,000 more will go by the board. Then, too, judgments and other claims against the State demand an extraordinary outlay this year. In

the face of such conditions the Administration must get more or spend less, or do both.

Since Gov. Higgins urges no plan for increasing revenue, his mind is evidently turned toward the sound policy of retrenchment. For example, instead of having a census of the State at a cost of $600,000, he would have a mere enumeration at $250,000. This, of course, is only a drop in the bucket. His main reliance is to persuade the finance committees of the two houses to supervise rigidly all expenditures. Here he is on firm ground, for his most valuable public services were as chairman of the finance committee of the Senate, where he gained an intimate knowledge of every branch of the State's business. In the Legislature, as in Congress, there are many separate appropriation bills, conceived with no particular reference to each other or to the resources of the treasury. Various members are trying to get what they can for their pet schemes. A consolidation of these different bills into a single act would go a long way toward enlightening the public and the legislators themselves as to ways and means. The Governor is under no illusions as to the pressure that will be exerted in "particular instances" even by the loudest advocates of "economy in the abstract." He is therefore, we assume, prepared to exert the great power reposed in him by the Constitution to veto separate appropriation items. Under this authority he can practically fix limits and declare that whenever they are exceeded he will interpose.

In treating the State charitable institutions, Gov. Higgins would evidently steer a middle course between centralization and local control. The former policy, as carried to the extreme by Gov. Odell, roused bitter hostility among many well-disposed people who were much interested in charities. Gov. Higgins, for his part, would not go all the way with critics of Gov. Odell, for he recognizes the demonstrated necessity of centralized management of financial operations. He would, whenever possible, make purchases in large quantities and from the lowest satisfactory bidders after public advertisement. The dribbling out of supply contracts through local boards would indubitably result in leakage and loss. The all-important, and at the same time difficult, point is the phrasing of a measure which shall define and adjust the relative rights of the two contending forces, shall secure economy and efficiency and "retain the coöperation of philanthropic citizens."

Residents of Greater New York will be gratified to learn that Gov. Higgins will resist the annual attempts to break down our Tenement-House law. This measure, which aims not merely at "the benefit of the poorest families," but also at "the general welfare of the community," is, in his view, definitively established. From his tone we are justified in inferring that no changes can be made except by the friends of the law.

The Governor's utterance on excise is also of deep significance. His mind is plainly more open than that of his predecessor, for he would have the Legislature consider whether the "right of local option should not be extended to cities and the divisions thereof." Thus far the desires of Greater New York have received scant consideration at Albany. Our virtuous rural statesmen, who stand sponsors for the malodorous Raines-law hotels, have recoiled with horror from the thought of allowing this wicked city to have a voice in the regulation of its saloons. The agitations of the last four years spent their strength against the granite of Gov. Odell's refusal to take up the question. Assemblyman Newcomb's bill for a referendum to discover the actual state of public opinion here and proceed upon it, was heartily backed by many of the most earnest advocates of temperance; and yet the whisper that legalized opening on Sunday was a possibility killed that measure before it fairly saw the light. The attitude of Gov. Higgins will lend heart to the movement led by District Attorney Jerome, the Rev. Dr. Charles H. Parkhurst, and others. This time New York may get at least half a loaf.

The temper of rural constituencies is not such as to nourish hope of an act immediately granting local option on Sunday opening. That phrase would be a flag of defiance to all the country churches. But the small end of the wedge would be local option as to the exclusion of saloons from specified districts. The main fight at this moment is for the establishment of this principle. Once the application has been made, it will be extended. The time may yet come when hours of opening and other police regulations will depend upon the widely different habits and needs of the communities which form this vast city.

THE METROPOLITAN MUSEUM.

On successive Saturdays the *Evening Post* has been publishing critical articles on the collections in the Metropolitan Museum. In the first essay it was shown that five-sixths of the drawings by old masters in the Vanderbilt collection were unworthy of exhibition; the remainder misnamed and recklessly catalogued. It was shown in the next article that there is about 10 per cent. of false attributions in the paintings by old masters. A third article revealed constant and only partly excusable disregard of chronology in the placing of casts and inscriptions. In the fourth and last article was brought out the fact that many of the Tanagra terra-cottas are forgeries, and that the two capital pieces of the "Olbia Treasure" are pretty certainly recent work of the creator of the Louvre Tiara of Saitaphernes. This discovery confirms rumors long current among art dealers and amateurs. In a word, so far as the *Evening Post's* investigation has gone, it has brought to light defective scholarship and bad museum management.

It was well that the facts should be displayed with considerable minuteness, because more general criticism was likely to be misunderstood, certain of the trustees having publicly and privately attributed these comments of the *Evening Post's* to its well-known atrabiliousness. Others hinted that the criticism was of an ignorant sort. Except in a small remnant of the governing body of our greatest American museum, there was found a marked disposition to maintain that this was the best possible museum in the best possible world. The refutation of such ill-informed optimism is the facts adduced by the *Post;* but perhaps the most instructive because unconscious illumination of the causes of the present disorder has been letters in the *Tribune* by a member of the executive committee and by Mr. George H. Story, curator of paintings. The trustee took the ground that all deficiencies which had been noted were due primarily to lack of funds for administration. Mr. Story brought out the significant fact that the necessary corrections in the attributions of the old masters in the Marquand collection were known to Mr. Marquand and himself some ten years ago. That no changes were made in the catalogue was due to Mr. Marquand's personal instructions. The trustee's apology *in forma pauperis* is plausible, and, of course, accurate as a definition of the growing financial needs of the Museum, but it displays a shortsighted view of museum economy. By various obvious savings, a fund to pay proper salaries to expert curators could be accumulated. Mr. Story's apologia puts him in the position of consciously perpetuating error to please a generous donor. This absolves Mr. Story, but it casts a rather startling light upon a novel attitude of donors towards their gifts. Apparently, the Marquand collection continued to be handled as if it were the private possession of its giver. And what would be the position of a museum which should honestly write on all its erroneous labels, "Retained by order of the President"? That Mr. Morgan will take any such stand, with regard to any exhibit, including his own "Olbia Treasure," is inconceivable; he will, on the contrary, both as a business man and as an enterprising collector, take such steps that the Museum shall be able in the future to detect forgeries through its own staff and before exhibition.

Mr. Story's avowal of the curious position he occupied as a perpetuator of error under Mr. Marquand, casts a strong

light upon the real weakness of the Museum. It has not had officials who exercised the responsibilities of curatorship. Too many of its curators are merely a superior sort of custodian. They have simply guarded the objects chosen and contributed by other people. Now the chief function of a competent curator is to serve as buying agent for his department. Knowledge of the market, and initiative, are indispensable; in fact, the ideal curator combines the qualities of the savant with those of the art dealer. The Museum has grown chiefly through the unstinted generosity of its trustees and friends. Such liberality has, taken in the large, been discriminating; it rarely, however, has been fully informed. There has always been a needful work of revision, which has by chance, and even by design at times, been left undone. The result of this neglect is the rather scandalous disorder which now prevails.

That there were reasons for this state of things we know, and, knowing, refrain from blaming anybody of the inner staff or the general administration. Trustees and private donors necessarily cannot have the knowledge it takes connoisseurs years to acquire; overworked custodians with no money to spend for acquisitions cannot become experts. The Museum has drifted into the present confusion through no especial fault of any one; so much, for the sake of argument, we concede willingly. But the facts are the facts. To-day, in all that pertains to scholarship, this institution brings discredit upon its administration and the city. There is a more important task than that of apportioning blame or determining historic causes. The situation itself makes its own appeal. Here are great sums to be spent annually with inadequate resource and skill to withstand the assault of astute forgers, interested dealers, and disguised art brokers; here is inherited error of the gravest kind to be set right. Clearly, the case calls for the ablest director and the most scholarly curators that can be had. Mr. Morgan can do no better service to the Museum he controls, and to the city, than to perfect an organization which will be answerable for everything but the financial management. It may be assumed that such a needful reorganization would find a place for those officials who have served long and faithfully according to their lights and opportunities. The imperative thing is that it should be undertaken. In the light of museum science as it is practised to-day, malfeasance would not be too strong a word to apply to any prolonging of the old régime. In this matter we are sure that we speak the thought of the most enlightened friends of the Metropolitan Museum.

THEODORE THOMAS.

Theodore Thomas, the most famous of American conductors, who died in Chicago on January 4, was not an American by birth. He had, however, lived in this country from boyhood, and in it his ambition, his interests, and his affections were centred. He was born in Esens, Hanover, on the 11th of October, 1835, his father being August Thomas, a violin player, who discovered his son's musical ability while the latter was still an infant, and did his utmost to encourage it. He succeeded to such good purpose that the young Theodore could play the violin cleverly when he was six years old, and was proficient enough to make a public appearance before he had attained the age of ten. In 1845 his family settled in this country, and remained in New York for two years, during which time the boy played successfully in concerts. His performance even then was distinguished by remarkable resonance of tone, precision, and delicacy. From New York he went South and travelled until 1851, when he returned to this city and played at the opera as one of the principal violinists during the engagement of Sontag, Jenny Lind, Grisi, and Mario. In 1853 he cancelled most of his engagements and devoted himself to a study of various branches of music, taking a course in harmony under Rudolph Schellinger. Under Arditi, who was then conductor of the opera during the engagement of Mme. Lagrange, Theodore Thomas rose to be leader of the orchestra, and continued to fill the position of leader and conductor in different German and Italian troupes until 1861, when he gave up all connection with the theatre. Before this, in 1854, he had become one of the leading members of the Philharmonic Society of New York, and in 1857 he travelled with Thalberg and afterwards with Piccolomini and other distinguished foreign artists. In 1855, in connection with Messrs. William Mason, Bergmann, Rosenthal, and Matzka, he established quartet soirées which proved immensely popular.

Mr. Thomas's authority as a conductor and as an expert in the making of programmes was now fully assured, and he began laying the foundation of that splendid orchestra which for many years represented the height of musical achievement in this country and made his name celebrated throughout the artistic world. In 1866 he gave concerts in Irving Hall, and subsequently travelled with his orchestra through many sections of the country, returning to give performances at the Terrace Garden in Third Avenue, and later in the Central Park Garden, which places became the Meccas of all lovers of good music. His orchestra remained practically intact until 1888. In 1878 the presidency of a new college of music at Cincinnati was tendered to him, and he accepted the offer on the express condition that he should be at liberty to carry on his work as conductor of the New York and Brooklyn Philharmonic concerts. He held this post for only two years. The success of the Cincinnati triennial festival, established in 1874, led to others of a similar nature. In 1884 Mr. Thomas organized a series of festivals in the leading cities of the country. At the close of these festivals, which occupied three months, his entire orchestra was taken across the continent to the Pacific Coast, where similar programmes were presented. In 1885 he accepted the directorship of Mrs. Thurber's American Opera Company. With a great orchestra and a numerous band of singers, he gave "Lohengrin," "The Flying Dutchman," "Orpheus," "The Taming of the Shrew," and "Nero" in various places. The enterprise was a monetary failure, but the important cities of the country enjoyed a rare festival of opera.

In 1891 he was called to Chicago to direct the new orchestra established in that city. He was not a stranger there, for he had visited Chicago as early as 1859, and ten years later began a series of orchestral concerts, continuing them, under local organizations, from 1870 to 1877. In this latter year he established in Chicago a regular season, gave festivals there in 1882-84, and continued the annual series of concerts after the establishment of the orchestra over which he had charge until his death. This orchestra was founded in 1890, through the efforts of fifty men who contributed each one thousand dollars. Since that time the orchestra has given many concerts in Chicago and elsewhere, and under Mr. Thomas's leadership has reached a high degree of proficiency. He gave the Chicago organization the use of his private musical library, the largest in the world, and of inestimable value. In 1895 he celebrated the fiftieth anniversary of his arrival in the United States. Only the other day, on the 15th of last December, he took formal possession of Orchestra Hall, the fine new building erected on Michigan Avenue, Chicago, as the permanent home of the band of which he was the creator. The occasion was a brilliant one, and the costly structure was filled with an enthusiastic audience, the élite of Chicago, to honor the man of whose lifework they were to enjoy the fruits. That night he conducted with all his wonted authority and inspiration, and there were no premonitions of the death that was soon to overtake him.

The most remarkable characteristics of Mr. Thomas as a musician were his catholicity of taste and consequent versatility. No one ever interpreted the oldest masters —Bach, Handel, Gluck, Haydn, Mozart— more impressively than he, or with a keener insight into the antique spirit of music. Beethoven and Schubert he worshipped, and he made propaganda for them every week of his life. At the same time, he was an enthusiastic champion of modern music. He did missionary work for Wagner, Liszt, and Berlioz, at a time when it meant money out of his pocket and the incurring of critical censure. And he kept his interest in new music to the last moment, his latest protégés having been Elgar and Strauss. In this catholicity of taste and ability to interpret the old and the new equally well, Theodore Thomas resembled Franz Liszt. He had chosen for his Philharmonic programme in this city, in March, Beethoven's "Eroica" symphony and Richard Strauss's "Death and Glorification," thus exemplifying his liberal-mindedness. Had there been room he might well have added some work like Professor Paine's "Island Fantasy" by way of calling attention to the fact that he did more for American composers than any other conductor has done.

Theodore Thomas was a born commander. As a general he would have held Port Ar-

thur as long as Stoessel held it. His stubborn determination to carry out his plans and wishes frequently got him into trouble, and he made many enemies; but they were for the most part enemies to be proud of. He was not without jealousy, and when Anton Seidl came to America he looked on him, unfortunately, as a rival rather than a helper. But when he became more familiar with Seidl's admirable work (with the Thomas orchestra) at some of Mr. Grau's operatic performances in Chicago, he cordially offered his colleague his friendship and praise. Dr. William Mason, speaking of the early days when he and the future conductor played chamber music together, says that Mr. Thomas "rapidly developed a talent for making programmes by putting pieces into the right order of sequence, thus avoiding incongruities. He brought this art to perfection in the arrangement of his symphony concert programmes." Here, indeed, lies one of his chief distinctions.

At rehearsals Mr. Thomas was a martinet. Woe to the player who, from indifference or lack of skill, made a mistake! Numbers could not hide him. Among twenty violinists his ear and eye would pick out the offender. In the concert hall his conducting was calm and undemonstrative, but he obtained the results he wanted because his men knew him. An amusing phase of his life, on which he himself liked to dwell jokingly, was that when he first began his career as conductor, some of his critics declared that while he was an excellent quartet player, he was out of place at the head of an orchestra. Later on it was said that while, of course, he was a first-class orchestral leader, he made a mess of it when he conducted a chorus; and, finally, when he assumed the bâton of the operatic leader, his ability as chorus conductor was conceded, while he was advised to keep his hands off the operatic scores. As a matter of fact, he achieved splendid results in all these departments of music, while he was greatest, undoubtedly, as an orchestral conductor.

His place will be hard to fill. The one crumb of comfort to music lovers in Chicago is that he would not have had many more years to conduct, as he was nearing seventy. He preserved much of his vigor, however, to the end, by eschewing work several months every year, and spending his summers on his estate in the White Mountains, of which Mrs. Theodore Thomas has recently given an interesting description in her book, 'Our Mountain Garden.' Glimpses may be had in this book of the tender side of Mr. Thomas's character. He had a keen sense of humor, and his Autobiography, soon to appear, will doubtless include some of the stories of his early experiences which throw an amusing light on the history of music in America.

THE ARCHÆOLOGICAL INSTITUTE OF AMERICA.

BOSTON, January 1, 1905.

The sixth general meeting of the Archæological Institute of America was held in Boston and Cambridge on December 28-30, 1904. The sessions of Thursday were held in Cambridge, in the Fogg Museum of Art; the others were held in Boston, in the buildings of the Massachusetts Institute of Technology. The first session, on Wednesday afternoon, was devoted to the commemoration of the founding of the Archæological Institute in Boston twenty-five years ago. The circular issued in 1879, calling a meeting to effect a formal organization, was signed first by President Eliot and last by Prof. Charles Eliot Norton, who is justly considered the true founder of the Institute, and who served as its first president for twelve years. Prof. F. W. Putnam of the Peabody Museum also was active in founding the Institute, and the presence of these three distinguished founders gave pleasure to the scholars who gathered for the general meeting. On Wednesday afternoon, after a graceful speech of welcome by the host, President Pritchett of the Institute of Technology, Professor Norton gave a charmingly characteristic address, speaking of the true aims of the Archæological Institute, of those who had been associated with him in its work, and of what had been accomplished. He was followed by Prof. John Williams White of Harvard University, President of the Institute from 1897 to 1903, and he in turn by representatives of the four chief fields of the Institute's scientific activity—Prof. James R. Wheeler of Columbia University, Chairman of the Managing Committee of the American School of Classical Studies at Athens; Prof. Andrew F. West of Princeton University, Chairman of the Managing Committee of the School in Rome; Prof. George F. Moore of Harvard University, Chairman of the Managing Committee of the School for Oriental Study and Research in Palestine; and Mr. C. P. Bowditch of Boston, Chairman of the Committee on American Archæology. The School at Athens was founded in 1881, soon after the Institute itself; the School in Rome in 1895, and the School in Palestine in 1901. At its first session in the Fogg Museum of Art, on Thursday afternoon, President Eliot welcomed the Institute, and in some detail drew out the contrast between what archæological excavators now uncover of the remains of the ancient Greeks and Romans, and what the archæologists of two thousand years hence are likely to find as the relics of our civilization—when the paper of our books shall have rotted, when the stone veneering shall have fallen from our buildings, and the iron frames shall have rusted.

The Boston Society of the Institute had made abundant provision for the social entertainment of the visiting members, including a dinner in the "Living Room" of the Harvard Union and a reception by Professor and Mrs. White; and on Friday noon all who were free from other engagements were received by Mrs. Gardner at Fenway Court. The papers presented covered the entire field of archæology. Prof. G. Frederick Wright spoke of the physical conditions in North America during man's early occupancy; Rev. Dr. William Hayes Ward on "The Evidence from Archaic Art as to the Origin of Babylonian Civilization," showing that it must have been imported; Mr. A. M. Lythgoe on an "Early Prehistoric Cemetery at Naga ed-Dēr, in Egypt." Mrs. Williams reported on the pottery found in Miss Boyd's important excavations at Gourniá; Prof. L. B. Paton on his explorations, which seem to have determined at least one point in the line of the third wall of Jerusalem; Professor Marquand on the temple of the Didymæan Apollo near Miletus, and so on to the Indian archæology of southern California and Mr. C. F. Lummis's entertaining presentation of the Primitive Music of the Southwest. As usual, papers on Greek subjects slightly predominated—owing chiefly, no doubt, to the influence of the School at Athens; but Oriental and American archæology had a fair share of attention. None of the papers were strictly philological. Some papers were read in full which should have been read by title and printed, but a specialist does not easily remember how unfamiliar his data may be to most of his associates. Important adjuncts to the meetings were addresses given on successive mornings in the Museum of Fine Arts—by Mr. Edward Robinson, the director of the Museum, on its collection of vases; by Mr. M. S. Prichard, assistant director, on the terra-cottas, bronzes, and coins, and by Mr. B. H. Hill, assistant curator, on the original sculptures in the Museum. The number of scholars in attendance was larger than usual, but none came from States west of Michigan or south of Mason and Dixon's line, except Mr. Lummis and Dr. Palmer from Los Angeles. The winter recess in our institutions of learning is not long, and not all scholars are willing to be absent from home during the Christmas holidays.

For the first time, the business meetings of the Council of the Institute and of the Managing Committees of the two Schools of Classical Studies were held in connection with the general meeting of the Institute for the reading and discussion of papers on archæological themes. Most of the business before the committees of the schools was of a routine nature, no important questions arising for determination. Great satisfaction greeted the announcement of the appropriation by the trustees of the Carnegie Institution, for a term of years, of $1,600 a year for two research-fellowships, and of $1,000 a year for the publication of the results of research, for the School in Rome, and of $1,000 a year for an architectural fellowship, and $1,500 a year for explorations, for the School at Athens. The Institute established a fellowship in mediæval and Renaissance archæology, to be administered by a committee, of which Prof. Allan Marquand of Princeton University is chairman. The Institute also enlarged its Committee on American Archæology, and appropriated $2,500 to be expended under the direction of this committee. This is probably the largest appropriation of the kind made by the Council, and indicates not only the increase in the means of the Institute, but also that the Council recognizes the desire of many members to have an efficient part in the work of American archæology. The Council gave its vote of sympathy with the bill proposed in Congress for the reservation as a public park of a district designated by the Colorado Cliff Dwellers' Association. The Institute's Committee on the Preservation of the Remains of American Antiquity has prepared a bill which has secured the approval of archæologists of all parties, and which will be urged upon Congress this winter. The commercial and wanton despoliation of American ruins has continued far too long.

The report on the publications of the Institute shows that several important works are nearly ready. The long-delayed second volume of 'The Argive Heræum,' an

elaborate exposition of the excavations conducted on that site by Dr. Charles Waldstein and his associates, is all in type, except the index. The first volume of "Papers" of the School in Rome, also richly illustrated, is to be published within three months. Of the folio publication of the explorations of the Institute at Assos, the second and third parts will be published together, leaving the fourth and fifth parts for a later year. The drawings of the architectural survey of the Erechtheum, on the Athenian Acropolis, are said to promise the most satisfactory publication ever made of an ancient building, but the form and time of publication are not yet determined. The facsimile of the Venetian codex of Aristophanes, published jointly by the Institute and the (English) Society for the Promotion of Hellenic Studies, has sold so well that the price of the remaining copies will be raised after April 1 next. For the elaborate work by Prof. A. L. Frothingham, jr., of Princeton University on the Triumphal Arch of Trajan at Beneventum, a prospectus is to be issued immediately.

The former officers of the Institute were reëlected with the exception of President D. C. Gilman, who declined a reëlection as vice-president, and to whose place Prof. George F. Moore of Harvard University was chosen. The membership of the Institute has been increased in a marked degree, and now numbers nearly 1,500. The next general meeting of the Institute is to be held in conjunction with the Philological Association in the Christmas holidays of 1905, at Cornell University.

BARONESS DU MONTET'S REMINISCENCES.—II.

PARIS, December 28, 1904.

The 'Recollections' of Madame du Montet are almost painfully disconnected—it is evident that she took to her pen in the most irregular manner, as the spirit moved; but this irregularity has its good side, as she wrote only under the impulse of a lively desire and of a clear perception of the past. We find, for instance, a passage on "Napoleon, First Consul," of this character:

"I have always," she says, "felt a certain distrust and incredulity in looking at portraits. I am glad to have *seen* Napoleon. There are historical faces which make us see clearly into history. I pity the contemporaries of this prodigious man who were deprived of this advantage; it seems to me that he must produce on them the effect of a cloud of fire, of a colossal bronze image, or of the exterminating angel. . . . It was in the month of July, 1801, in magnificent weather. The First Consul was to hold a review in the Court of the Tuileries. We had cards of entrance to the grand apartments through which he was to pass; they were filled with an enormous crowd when we arrived. Fine grenadiers enclosed us, keeping open way; my father was behind them. . . . [I remark here that this passage will remind the readers of Balzac of the beginning of one of his striking novels.] We stationed ourselves in front of the great staircase which the First Consul was to descend. He appeared a few moments after, surrounded by a brilliant cortège, all that Paris contained at the time of the famous generals. We fixed our gaze only on Napoleon. He wore the green chasseur uniform without gold; a very simple hat also. . . . On reaching the landing, he stopped suddenly and put his hand to his hat, casting on our little group a glance which I shall never forget. We were dressed in white, and had on our heads (it was the fashion of the time) rather long veils of very thin white muslin. . . . My father gave us his arm; his face was noble and severe; his dress still revealed the old soldier; there could be no mistake—he was a real gentleman. The First Consul regarded us with a deep, scrutinizing look, with a glance of well-marked benevolence. . . . Perhaps he thought that we had a petition to present to him—the *émigrés* often presented them at the throne. I can say without presumption that it would have been well received.

"Bonaparte was then twenty-nine or thirty years old. He was very thin, pale, with very dark hair and eyebrows; his physiognomy had a sort of melancholy which expressed not a painful preoccupation, but, rather, profound thought. . . . The Emperor Napoleon, very fat at the end of his reign, did not resemble at all the First Consul."

Many are the details given on the subject of the Empress Marie-Louise. In July, 1815, Madame du Montet writes from Baden (near Vienna):

"This is the life which the Princess leads at Baden this summer. She rings for her women at six or seven o'clock. Her inkstand is brought to her, and she writes in bed till ten o'clock, when she gets up. Her morning like her evening toilet is delicious; her women take extreme care of it. At eleven, the *grande-maîtresse* comes down, as well as all the persons of distinction attached to the Princess. Then comes an excellent breakfast. She works, draws, performs music like an angel—most of the time with her *grand-maître*, General Count Neipperg, who is an excellent musician. Nothing is said, nothing done without Marie-Louise inquiring of this officer, 'What do you think of it, General? What do you say, General?' It is the everlasting refrain."

"Here are some examples of her rare coolness. When she heard the news of Waterloo, she was at the castle of Schoenbrunn. She took in the afternoon a long ride, without showing the least emotion. Élise's husband is *cavalier d'ambassade*, and Élise was afraid, on account of some commission she had given him, that he might not have arrived in time for the battle of Waterloo. She expressed this fear very unwisely to Marie-Louise, who, after having heard her for a long time with the greatest patience, ended by responding coldly, 'Are you going mad?' "

"The Empress said one day to Élise that Napoleon only once showed himself angry with her, telling her 'You are a *petite sotte*, and I will send you back to your father'; upon which she turned majestically towards him and said to him: 'It is all I desire.' He immediately asked her pardon."

So little has been said about Marie-Louise after she was brought back, not unwillingly, to her father, that I will cite some more extracts from Madame du Montet's journal. She writes, again from Baden, in July, 1815:

"Marie-Louise is pretty, as fresh as a rose, and with a charming figure. People here are surprised at this change, for when she left Vienna, she was awkward, she walked and stood with little grace. She is adored by her attendants. Élise tells me that Napoleon's servants who followed the Princess have an attachment which savors of fanaticism for the ex-Emperor; his reverses throw them into despair. One of the ladies, who is the wife of a confidential surgeon of Napoleon, speaks of him only with tears in her eyes. A few days ago she saw the little Prince up to some childish tricks. 'What a pity!' she exclaimed; 'they will make of him a little Capuchin.' "

The French servants of Marie-Louise were soon replaced by Germans; her *grand-maître*, the Marquis de Bausset, did not long remain. The Emperor had made M. de Bausset a baron; he said at Vienna: "The first thing Louis XVIII. did for me was to give me back my title of Marquis." (M. de Bausset published Memoirs not devoid of interest.)

During the Congress of Vienna, the Princesses were constantly putting questions to Marie-Louise about Napoleon. They would be informed what degree of intimacy there was between them, whether Napoleon allowed her to have a confessor, etc. The Grand Duchess Catherine was the most indiscreet; speaking of M. de Neipperg to Marie-Louise, she would always call him "your general"; speaking of Gen. Koller, she called him simply "my general." Marie-Louise once told how she first saw Napoleon. She did not expect that he would go so far to meet her. She was in a carriage with Mme. Murat, the Queen of Naples; it was very hot, and they had taken off their hats and put lawn handkerchiefs on their heads. They saw a great cloud of dust; the door of the carriage was opened; Mme. Murat was frightened. Napoleon kissed the forehead of Marie-Louise several times before saying a word.

During the war of 1809, Napoleon established his headquarters at a little distance from Vienna, in the splendid Benedictine abbey of Mölk, which still exists and may be admired on the way to Vienna. Madame du Montet gives some details about his stay there:

"He occupied the great ceremonial apartments. The furniture and the pictures were very simple, but the rooms were adorned with the portraits of the Princes of the Imperial house. That of the Emperor Francis II. occupied the place of honor. After a few moments' repose, Napoleon sent word to the superior that he wished to speak to him. The old man obeyed the order, and arrived at once with two monks, one of whom, Aloys Stüpfel, an Alsatian, was to be the interpreter. Napoleon was in the middle of the room, on a chair which he kept half-turned before him. His face was dark and threatening; he looked intently at the Father Abbé, and put him this question: 'Can the Church release subjects from the oath of fidelity taken to their Prince?' . . . The old man, broken by age, made such an energetic answer that the officers present were stupefied, and feared a violent scene. After a moment of silence, Napoleon changed the conversation."

I have met with this anecdote nowhere else. It is characteristic of the state of mind of Napoleon at the time. He visited, during his stay at Vienna, the monument which Canova had made for the Archduchess Maria Christina, by the order of the Duke of Saxe-Teschen. It was late in the evening, when the monks were already in their cells. He admired the work, and said merely, "Vanité des vanités, tout n'est que vanité." None of the officers who were with him knew, nor did he himself, that it was in the same church that the unfortunate Marie Antoinette had been affianced and married by proxy to the Dauphin of France.

It is curious to read the observations which Madame du Montet makes on the son of Napoleon, the Duke of Reichstadt. She saw much of him, and writes, at the end of 1817:

"Prince François has all the gestures and attitudes of his father. It is very singular, for he could not copy them from him, as he did not see much of him, and his governors here try to correct them. He continually keeps his hands behind his back. He also has a habit of advancing one foot, as Napoleon did. His long blond hair, which is carefully curled every evening with forty *papillotes*, make him look deliciously pretty, but this toilet is insupportable to him, and he asks constantly that his hair be cut, like that of other children. [There is, in

the Château de Chantilly, a little portrait of the young Prince, with this abundance of curls, which, I believe, came from the Princess of Salerno, who was an Austrian Archduchess, the sister of Marie-Louise.] He resembles the children of Maria Theresa in his eyes, complexion, and beautiful blond hair; but he has in his mouth and his general aspect something which reminds one of his father. . . . This child has certainly much intelligence. . . . History is his passion. He is timid, and always consults with his eye Count Dietrichstein, his *grand-maître*, before doing anything or accepting anything."

The passages which I have excerpted from the 'Recollections' of Madame du Montet will probably save her book from oblivion. It is a pity that she did not put some sort of order in a work which here and there has interesting pages, and notes on an immense number of people. As it is, the volume can be read only as you listen to an interrupted conversation. The writer was evidently fond of gossip, and most of her recollections can be classed only under this rather vulgar expression.

Correspondence.

BIBLIOGRAPHIES AND BIBLIOGRAPHIES

To the Editor of The Nation:

Sir: I am sorry that in the issue of the *Nation* for December 29 you find it advisable to speak with such severity of the series of bibliographies prepared under the direction of Mr. Griffin of the Library of Congress. All that your reviewer does say is very likely true, but these lists, I think, ought in fairness to be judged according to the measure in which they fill the purpose for which they seem to be intended. I am not too familiar with them, but they have impressed me as standing somewhat to bibliography as newspapers do to literature, serving a present need, and as an aid to busy people in quick and probably superficial investigation. The speed with which they appear indicates the character of their construction. It must surely be of considerable service to public men, especially in Washington, to be able to reach promptly a mass of information, even if it is not fully digested, on such timely matters as Chamberlain's tariff plan, on "recognition" in international law, or on the popular election of Senators. When we speak of bibliography in its full sense, that is quite another matter. I have been at this humble trade for nearly twenty-seven years, and I honestly doubt if elaborate bibliography serves any extended usefulness. These lists, however, are unpretentious, and seem practical and timely, wholly aside from the question of their scholarship, accuracy and the natural differences of opinion as to methods of arrangement pursued. In regard to the partial furnishing of notes of information, I recall that Mr. Griffin is one of the pioneers of descriptive bibliography, and has rendered no little service in this way. The fact is, any elucidation which clears the tangle of books on any subject is just so much to the good, and as for the perfect bibliographer, there is none perfect—no, not one.

Possibly your reviewer has unintentionally failed to give credit for the actual zeal shown and the help probably rendered to others besides scholars and thorough investigators. As a rule, experts can look out for themselves. Lindsay Swift.

Public Library of the City of Boston, January 7, 1905.

[We allow full weight to the above plea in mitigation, but we could adduce careless and erroneous annotation in addition to technical defects of arrangement, etc.—Ed. Nation.]

A DISCLAIMER.

To the Editor of The Nation:

Sir: Very greatly valuing the application of your higher canons of criticism, I can with ill grace complain of your judgment of my 'Abraham Lincoln.' I think, however, that the slur which your reviewer cast upon "my" grouping, in the phrase, "the Garrisonian-Giddings-Lovejoy-John Brown method," is not deserved, since it is mine in no sense, and it ought to be a plain inference from my text that I am describing a kind of feeling in the South, where, at the time, distinctions as to the precise views of Mr. Garrison and John Brown were not clear—where, indeed, existed a desire to confuse names and place the responsibility for violence where it did not belong. If I have not made myself understood in so plain a matter, it is my sad misfortune.

Any "sordidness" in my view of Lincoln is not felt, and it is again a misfortune if it has been expressed. If the testimony of Herndon, and the many whose reminiscences have been gathered by Mr. Thorndyke Rice, and the impressions of men like Charles Francis Adams, Goldwin Smith, Henry Villard, and Edward Dicey are to be disallowed, the picture may be more pleasing, but it will be very far from dispassionate or just. As for the rest, there is much in the point of view. That my portrait may not be perfect in color or proportions is entirely conceivable. It is, at any rate, an attempt at an honest presentation of character in the light of this century, when we are coming to think less and less of the meaning of those old names "North" and "South," wherein for long lurked so much antagonism, suspicion, and bitterness. Ellis P. Oberholtzer.

Philadelphia, January 6, 1905.

THE ARCHÆOLOGICAL CONGRESS AT ATHENS.

To the Editor of The Nation:

Sir: Dr. T. W. Heermance, Director of the American School of Classical Sttudies at Athens, kindly wrote me a letter on the 18th of December containing information in regard to the coming Archæological Congress at Athens, which cannot fail to be of interest to a large circle of readers of the *Nation*.

The committee on the Archæological Congress met on the 17th of December and fixed definitely the date of the meetings. The Congress will be opened on Saturday, the 8th of April next, and the sessions will close on Thursday, the 13th of April. On the 14th of April the special archæological journey will begin, and will continue until Tuesday, the 2d of May. A special steamer will convey the party taking the journey to some of the more important sites in Greece accessible by sea, and to some of the Cyclades and other islands, to Crete, to Rhodes, and to some of the coast cities of Asia Minor, and finally to Troy and to Mt. Athos. This itinerary is unusual, and exceptionally attractive. It cannot fail to open new vistas to those archæologists who may be so fortunate as to take the voyage. The Congress, whose opening session, as I understand, is to be held in the Parthenon, will surely be most stimulating to the progress of archæology.

In general, as one who feels the stirring influences of the meetings in connection with the twenty-fifth anniversary of the American Institute of Archæology held in Boston last week, I should like to be allowed to say here that I am convinced more firmly than ever that the significant advance in scientific archæological research made by American scholars in the last quarter of a century, and the widespread sympathy with this study, are among the most potent agencies to cope with whatever of vulgar materialism exists among us, and to give shape to aspirations for culture—culture at once refined and quick with large humanity of feeling.—Very truly yours,

William Carey Poland.

Providence, R. I., January 2, 1905.

Notes.

We recur to the announcement of the Arthur H. Clark Co. of Cleveland, the publishers of the important historical series, "The Philippine Islands, 1493-1898," that the edition will be strictly limited to the number of subscribers after February 1 next. They state that the support accorded this publication, which was to comprise 1,000 numbered sets, has been so inadequate that they are facing serious financial loss upon it, but that they intend to complete the fifty-five volumes promised for the libraries and individuals who have subscribed. Thus far, less than 100 sets have been placed in this country, although a larger number have been placed in the public libraries of Europe, India, Australia, the Far East, and the Philippines. Of the sets thus far sold in this country, all but seven are in public libraries. Twenty volumes had been issued to the end of the year, and, after the issuance of volume 22 on or about February 1, the number of volumes printed prior to that in excess of the number subscribed will be destroyed. The publishers are strictly correct in alleging that this "is the only work making anything like a comprehensive array of Philippine historical sources available in any language, particularly in English, and the call for it will increase from year to year, especially when the volumes cover more recent years and the index volumes make these sources more readily available." "With the limitation of this work to so few sets, it will practically not be procurable later on, and will scarcely be found outside of the larger reference libraries."

We may add that the Arthur H. Clark Co. announce that volume xxxii. and possibly a portion of volume xxxiii. of the Philippine series will contain the original Pigafetta relation of the Magellan expedition, with a page-for-page English translation. The Italian text is copied from the original manuscript in the Biblioteca Ambrosiana,

Milan, Italy, the oldest Pigafetta manuscript in existence. All the peculiarities of the manuscript (which is written in the queer Venetian dialect of the early sixteenth century, with occasional French and Spanish words) have been carefully preserved; and thus for the first time will scholars who cannot have access to the original manuscript be enabled to have before them the exact text of Pigafetta, along with the copious annotations, while the translation will for the first time open to English readers the unabridged narrative. It was at first the intention to publish the older of the two manuscripts (both in French) which are preserved in the Bibliothèque Nationale, Paris, and that manuscript was actually copied; but it had to yield to that of Milan. Pigafetta's is a sympathetic and apparently true account of the first circumnavigation of the globe, and is full of information of many strange lands and peoples.

A. C. McClurg & Co., Chicago, make the important announcement that they will bring out in April the Musical Autobiography of the late Theodore Thomas in two volumes—"the first devoted to his life work, the second almost entirely to programmes." The work was quite finished before death overtook the writer, and had been intrusted to Mr. George P. Upton, the well-known writer on music, who will essay an appreciation of the great conductor. A chapter on "programme-making," from Mr. Thomas's own pen, will accompany (with other like discourse) the groups of programmes here brought together.

Brentano's have nearly ready two volumes in a series of handbooks entitled "The Music of the Masters," viz., 'Wagner,' by Ernest Newman, and 'Tchaikovsky,' by E. Markham Lee. They will deal solely with the music of the respective composers, and will contain many musical quotations.

Four of Lord Beaconsfield's novels, 'Vivian Grey,' 'Coningsby,' 'Sybil,' and 'Tancred,' are to be brought out handsomely in March by L. C. Page & Co., Boston, with photogravure frontispieces and critical introductions.

'Who's Who' for 1905 is, from force of habit, larger than its predecessor (London: Black; New York: Macmillan). Its principle of inclusion is not defined even for British subjects. The American ambassador at St. James's, Mr. Choate, naturally finds a place, but equally does our ambassador to Rome, Mr. Meyer, and Prof. Dewey of Columbia (for example). The existence of 'Who's Who in America' might suggest a reduction and elimination on this line to cope with the swelling home matter. Continental names occur sparsely, yet often enough to enhance the value of this standard work of contemporary biographical reference.

To the Athenæum Press Series (Ginn), Mr. Beeching contributes a convenient and useful edition of 'The Sonnets of Shakspeare.' The introduction fills fifty-five pages; the notes, fifty-one. Concerning the identity of Mr. W. H., the dark lady, and the rival poet, Mr. Beeching adopts the only tenable view—that of the agnostic. Certainly the Sonnets can no longer be regarded as having been written as mere poetical exercises or in adulation of a patron; they must, if interpreted most naturally, have had a basis of actual experience. But that Southampton, Pembroke, "William Hughes," William Hervey, or any other person thus far mentioned was the friend, is "not proven." All that can safely be affirmed is that he was "a person known in society, of good birth and fortune," but not necessarily a nobleman; and possessed of the wit and passion which were typical of the gay Elizabethans. As for the claims of Chapman, Daniel, and Barnes to be called the rival poet, Mr. Beeching is equally skeptical. The section dealing with form and style is admirably specific; the illustrative lists might have been extended to advantage. The notes are concise, but in general satisfactory. The note on *canker-blooms*, liv. 5, might have included a reference to correspondence in the *Athenæum* for July 23-August 27, 1904. On the bibliographical side Mr. Beeching's book, like most text-books of our time, is inadequate. But what he has attempted, Mr. Beeching has done well.

The 'Vital Records of the Town of Brewster, Mass.,' to the end of the year 1849, is the first fruits (apart from the *Mayflower Descendant*) of the Massachusetts Society of *Mayflower* Descendants. The industrious editor of that periodical, Mr. George Ernest Bowman, has had the collation and proof-reading of the present volume, which is to be followed rapidly by similar ones for Halifax, Truro, and other towns in Barnstable and Plymouth Counties. To this end, a "Cape Cod Town Record Fund" has been established (and must be sustained) by private gifts. The execution in the case of Brewster is admirable, and all the names of those whose births, deaths, and marriages are recorded in the eight original volumes are duly indexed under one alphabet. Contributions or orders should be sent to Mr. Bowman at No. 53 Mt. Vernon Street, Boston.

In recording the completion of Miss Hapgood's translation of Turgeneff (Scribners), in sixteen volumes, comprising *all* the novels and tales found in the St. Petersburg editions of that author's works, we should have remarked that "The Region of Dead Calm" (volume xii.) seems to be the tale to which a correspondent in the *Nation* for April 21, 1904, refers under the title "Country Life," and which, as he states, is not included in Mrs. Garnett's translation.

The "Maybrick Case" had certain peculiar features, the most important of which was the impaired mental health of the judge who tried it; but everything of public interest about the matter has been long since told. 'Mrs. Maybrick's Own Story' (Funk & Wagnalls Co.) adds nothing to our knowledge in this respect, and will not alter the judgment of such as have concluded, after a careful examination of the record, that the Home Secretary did well in recommending a commutation, and not a pardon. Whatever value the book has, is due to the account given by the author of the administration of prison discipline in England, which appears to be, compared with our own practice, exemplary.

In the five hundred and odd pages of 'The Naval Constructor,' by George Simpson, M.I.N.A. (New York: D. Van Nostrand Co.), there is compactly stowed nearly, if not quite, all the material data needed by those engaged in the design, construction, equipment, and maintenance of ships. As it would be inconsistent with sanity to attempt to know all the facts this book contains, it may well be recommended to modern shipmen as a vade-mecum, in accordance with the claim of the title-page and the handy size of the volume.

In his 'Analytic Interest Psychology and Synthetic Philosophy' (Baltimore: King Brothers), Mr. John Summerfield Engel, a graduate student in the Johns Hopkins University, imports into psychology from pedagogy an element all but entirely neglected hitherto by the psychologists; and he seems to have struck a rich vein. This neglected through recognized element is *Interest*, of which the pedagogicians have always made much. It is surely wrong that the pure science should pay so little attention as it has hitherto done to a fundamental element that shows itself so important in applied science. The book evinces a very considerable force of thought, with thorough and original study. A further prosecution of the theory will clear it of its crudities, and it is likely eventually to undergo considerable modifications; but it deserves mention now as the first germination of a body of thought which by its vigor and vitality promises to grow into something that may occupy a large place in the future of psychology. At present, Mr. Engel would reduce all feeling, volition, and cognition to the action of Interest, and to make it the corner-stone of philosophy, which we guess is a good deal too much.

The latest of the Knackfuss 'Monographs on Artists' (Bielefeld and Leipzig: Velhagen & Klasing; New York: Lemcke & Buechner) is devoted to George Frederick Watts, with text by O. von Schleinitz, and the usual profusion of reproductions. In these, Watts's largeness of composition and weight of thought are as conspicuous as ever, but the defects of the process have rather accentuated the faults of his technical method, so that one gets a rather painful impression of woolliness and feebleness of representation. A few of the portraits form exceptions to the rule in this respect. We miss the noble portrait of Joachim, one of Watts's finest and most unequivocally successful productions.

The publication in German of Professor Fahlbeck's recent work 'Sveriges Adel,' under the title 'Der Adel Schwedens [und Finlands],' brings a very meritorious treatise before a larger audience. The Swedish edition has been compressed into one volume, and such matter has been omitted as was of comparatively local interest. The work undertakes to study the vicissitudes in decline and regeneration of a class, and is led into what is really a biological examination of fertility, longevity, mortality, and the many other elements that enter into the complicated question. The basis of the study is largely genealogy, but the author cuts loose from the microscopic scrutiny into which genealogists often fall, and envisages the subject in a way to give his results a wide-reaching importance for the social sciences. Of especial interest is the discussion of the "results and dangers of the two-children system." The author thinks that restriction of births was a factor in antiquity second to none in inducing degeneration and decline. He realizes, however, as many harsh judges of the so-called disciples of Malthus do not, the forces in the modern systems which make limitation of offspring inevitable. Among these he is led to assign great weight to the movement towards an independent status on the part of women. He regards

four or five as the ideal number of living children to the family, and he looks to religion alone and a "sense of duty towards the Origin of all things" to react against the tendency of the age, and to inspire man to present sacrifice for the sake of society and the future.

The third volume of the 'Jahrbuch der Deutschen Bibliotheken' has received a welcome addition to its list of publications relating to the various libraries, in that not only the titles in the two previous volumes have been cumulated, but the principal references in the 'Adressbuch' of 1893 have been added, making a very complete bibliography of the chief sources of German library history. These sources are very numerous, and show clearly the important place which libraries occupy in the intellectual life of the nation, besides being a worthy monument to the literary activity of German library workers. The statistical part of the present volume is devoted chiefly to library buildings. Circulars asking for data were sent out to the 147 libraries contained in the previous volume of the 'Jahrbuch,' and 124 replied. The 23 from which no information could be gained are mostly of minor importance, though the university library of Heidelberg is one of them. During the past year six foreign institutions have entered into agreement for direct loans with German libraries; among them the Academy of Sciences in St. Petersburg and Trinity College in Dublin.

The philosophical faculty of the University of Vienna has decided no longer to permit the promiscuous attendance of women at the practical exercises of the teachers and the lectors as special students (*Hospitantinnen*). In a communication to the *Neue Freie Presse*, the dean of the philosophical faculty, Dr. Meyer-Lübke, gives the reasons for this reactionary step, the chief being that the privilege has been abused, and that women have flocked by scores to these practical departments, who, unprepared to do the work, evidently came chiefly because private lessons in French and English were too expensive. Practically the measure means that women will be admitted only after a more rigorous examination of their abilities, and, of 97 applicants recently made, 20 were rejected. Naturally, this decree does not affect the regular women students.

The *Frankfurter Zeitung* reports that the number of foreign students at the French universities is steadily increasing. During the past academic year the total was 2,510, and of these, 1,003 were women. Paris alone reports 1,315 foreigners, and among them 401 women. Montpellier has 224 foreigners enrolled, fully half of whom are women. In Grenoble there are 223 foreigners, nearly all of these being Germans; and in addition 352 non-French took part in the well-known "vacation courses" of this institution. Of the other French universities, Nancy reported 165 foreigners; Lyons, 87; and Bordeaux, 86.

A new scholarship scheme for the public schools of London has been presented to the County Council by a sub-committee of that body. It has some features of general interest. Under the present system 3,174 children of parents whose income is below a certain sum hold scholarships valued at $390,000. The new plan proposes to throw open the junior scholarships to all pupils of the elementary schools of the age of 11-12, who have reached the "scholarship standard," with an additional maintenance allowance when needed. These scholarships would then cease to be badges of poverty and become titles of honor, the striving for which would supply an immense stimulus to the work of the children and secure the interest of their parents in their education. The expenditure, it is estimated, would in 1910-11 amount to $1,376,000. The scheme is criticised by the London Teachers' Association as one aiming to secure teachers rather than to improve the general education of the London children. This is shown by the selection of twice as many girls as boys, and the restrictions on the continuance of the scholarships after 14 unless a bond to become teachers is entered into. Such a plan, "while giving girls opportunities of becoming teachers, will not help the nation in competition with other countries, as too few scholarships will go to boys."

A novel educational feature in the Far East is a course of "visual instruction as to Great Britain" about to be introduced into the curriculum of the schools of Hong Kong, the Straits Settlements, and Ceylon. Simple lectures on the scenery, country life, London, historic centres, etc., have been prepared and are to be translated into the different languages spoken by the children of these colonies, and will be illustrated by lantern slides. The object of the scheme, in furthering which these colonies have taken the lead and provided the funds, is to strengthen through mutual knowledge the ties uniting the Empire.

—The January *Harper's* opens with a readable sketch of Dr. Thomas Radcliffe, famous for his attendance, and his refusals of attendance, upon ailing British sovereigns, about the close of the seventeenth and beginning of the eighteenth centuries. Dr. Radcliffe is said to have died of an apoplexy brought on through fear of being murdered because of the popular resentment aroused by his crusty refusal to comply with a summons to the bedside of the dying Queen Anne. The article is finely illustrated with reproductions of portraits of Queen Anne, Dr. Radcliffe, and other famous physicians of the time. Professor Lounsbury discusses the *-or* vs. *-our* controversy, with the comfortable conclusion that one has a right to his individual preference in the matter. Prof. John Bassett Moore traces the steps by which the United States advanced from the traditional transatlantic doctrine to the position that a man has the natural right of expatriation, with the full right to claim protection by the country of his adoption against any further claim of authority over him by the Government which he has abandoned. Hugo De Vries, the Amsterdam botanist, describes an extended series of experiments with the great evening-primrose (*Œnothera Lamarckiana*), by which he has been led, contrary to most biologists, to the conclusion that permanent variations in natural development originate in sudden leaps, rather than by the slow accumulation of changes so slight at any one time as to be practically invisible. The Easy Chair discusses sweetly the problem which now and then generates so much of the *odium philologicum* in more scientific circles, whether or not people can think at all without "thinking in words." The decision is in the affirmative, which has the double advantage of being right and of cutting the writers of romance out of the claim that they have really *thought* simply because they have been so prolific of words —a claim which might be hard to dispose of if the identity of language and thought were once admitted. We have the promise for February of some new Longfellow material—a really important find, if we may accept the estimate of the publishers' announcement. Another interesting announcement is that Mr. Howells and Mr. James will exchange their literary bases for the year, Mr. James being in America to write of things American, and Mr. Howells studying at first hand the England of to-day, both exclusively for—etc. We do not feel sure that the willingness of our most prominent writers to bind themselves so closely to one channel of expression is in the best interests of literature, however unobjectionable that channel may be.

—Dr. Andrew D. White's second paper on Hugo Grotius easily takes first rank among the contents of the January *Atlantic*. The 'De Jure Belli ac Pacis,' "the most beneficent of all volumes not claiming divine inspiration," is nevertheless not so wonderful as the faith of its author in working out such doctrines at a time when no other human being could see in the anarchic darkness of the age any tribunal which could recognize a plea for right reason in international affairs, or enforce a decision upon it. By faith alone could Grotius have courage to appeal to the heart and mind of man as the supreme tribunal. Dr. White makes the pertinent suggestion that, in the palace of international justice to be erected at The Hague, the statue of Grotius should stand supreme among the memorials with which its corridors will doubtless be embellished. The first instalment of Thoreau's Journal is contained in this number, with an introduction of some length by Bradford Torrey. It will doubtless be a surprise to many to be informed, with ample proof, that Thoreau's real knowledge of the plant and bird life about him was of a very limited character, and that, too, in matters in which knowledge depended upon nothing more difficult than the application of a good pair of eyes to what was continually going on about him. One is amused to find him on February 7 moralizing in a self-gratulatory tone as to his superiority over his neighbors in being able to dispense with winter clothing, only to be housed a week later with a severe attack of bronchitis. But there is evidence that experience brought wisdom, for ten days later he writes: "The care of the body is the highest exercise of prudence. If I have brought this weakness on my lungs, I will consider calmly and disinterestedly how the thing came about, that I may find out the truth and render justice." Col. Higginson gathers up still another thread of reminiscence in a paper on American audiences in the earlier days of the lecture platform.

—Mrs. Steuart Erskine's 'London as an Art City' (Scribners) belongs to a series of art monographs edited by Selwyn Brinton. It is clearly impossible in so brief a space to treat of the art treasures which London possesses, nor is the term "art city" at all suitable to London from any aspect. Mrs. Erskine's sketch begins with

the earliest times: she considers that the Romans, when they imposed their laws on the country, in 61 A. D., gave the first impulse to art also. They founded the city, on their own lines, on the two hills divided by the Walbrook from the site of the Tower to the Fleet, Southwark being a populous suburb connected by a fortified bridge. Roman remains in the British and Guildhall Museums and tesselated pavements which are still existent show that the Romans made use of designs similar to those employed in Rome. Mrs. Erskine swiftly touches on the succeeding artistic impulses which made London down to our own twentieth century and its latest monuments—the splendid Roman Catholic Cathedral at Westminster in the early Christian Byzantine style, of brick and stone, with its campanile 284 feet high, designed by J. F. Bentley, and Lloyd's Registry, in the Renaissance style, in the City. A chapter is devoted to literary London, which tells of the associations of certain places with authors of celebrity, and another describes studios and artists. Mrs. Erskine has very optimistic views as to what is being done architecturally for London at this moment. She also seems hopeful about the tendencies of painting and sculpture. The book is illustrated fairly well, but has no index.

—Apparently the Anglo-Saxon race has, among its other qualities, an unlimited power of purchasing books on the French Revolution. The publishers will not call a halt until they are encouraged to do so by the public. In the meantime, the reviewer groans under a burden of writings which add nothing to the store of knowledge, and represent only the intrusion of kindergarten methods upon a sphere that does not belong to them. For thirty-five years after the restoration of Louis XVIII., France poured forth a tide of memoirs relating to every aspect of the Revolutionary and Napoleonic era. Whether authentic or apocryphal, most of these works were spun out to enormous length for the purpose of making lucrative "copy." During the past decade it has become a recognized industry to translate such literature, abridge it, make it the basis of historical novels, and, in short, to work it up in every conceivable style. No form of book-making is less difficult, but one may doubt whether it serves any useful end. We need not continue the subject farther. The foregoing remarks, which might be illustrated at great length, derive one further illustration from 'A Daughter of the Revolution,' by Catherine M. Bearne (Dutton). The central figure of this volume is Mme. Junot, the Duchess d'Abrantès, whose copious autobiography supplies most of the material required. Here and there bits, like Cazotte's prophecy, are interpolated from other sources, in order to lend the narrative more vivacity, but with few exceptions Mme. Junot's own tale is found the most convenient magazine of detail and anecdote. We cannot see that much skill has been shown in the work of adaptation, and therefore it becomes impossible to praise either method or result. Were there fewer books of the same sort, one might adopt a more genial tone in referring to this one, but in the interest of history we must protest against the multiplication of abridged and adapted memoirs.

—The Rev. Kota Hoshino's 'Mission of Japan and the Russo-Japanese War' (Yokohama: The Fukuin Printing Co., Limited) is a small tract of some sixty pages, half patriotism, half religion. An appendix gives the official correspondence containing the negotiations between Japan and Russia preceding the war, but the main drift of the book is to draw as a moral from Japan's present situation that what is needed chiefly there to "crown the edifice" is the general adoption of Christianity. The author is an ordained minister of the Church of Christ in Japan, and his main reason for advocating this change is that the country is in need of a religious system of greater moral power than any which it now has, and can find this only in Christianity. His conclusion is stated rather than supported by argument, and so is rather lame. We are merely told that the days of Buddhism and Shintoism and "Bushidōs" are over, and that to escape Utilitarianism and Materialism the only resource is the gospel. The greater part of the tract is a summary of facts bearing on the political and belligerent birth of the new Japan, and there is such a want of continuity between this and the religious part as to lead to a suspicion that the reverend author does not himself very well know why Japan should suddenly become Christian. One or two Japanese authorities whom he quotes seem to look upon the adoption of Christianity as an inevitable part of a true state policy. To be entirely Western and modern, and like those wonderful Americans who first showed Japan the path, is it not necessary to be Christian, too? Was it not through Christianity that modern Europe became great? Can a nation be truly great without becoming Christian? The old answer was that no nation could become great without accepting Christianity, because Christianity was the final revelation of Truth. Statesmen have, however, even in the Western world, promoted Christianity for other reasons.

—The Central Division of the Modern Language Association of America, writes a correspondent, held its tenth annual meeting in Chicago, December 28-30, in the City Building of Northwestern University. The meeting was in many ways a noteworthy one. In point of attendance it was considerably larger than that at Ann Arbor last year, notwithstanding the fact that last year's meeting was a national, and not a "division" meeting. Thirteen States and Canada were represented by teachers of modern languages from twenty-three educational institutions. Not only was the attendance larger than in former years, but there was a noticeable increase in the number of women present, and in the number of teachers from the secondary schools. Perhaps the most significant feature of the convention was the attention bestowed upon topics broadly educational in their scope, and hence of interest to men from the university and from the secondary school alike. The dominant note was struck at the first session by Professor Hohlfeld in his chairman's address, when he affirmed that the time is ripe for a readjustment of ideals here in America, such as has already been started in Germany. The university ideal of scholarly research ought not, he said, to be allowed to supplant permanently the old ideal of faithful and devoted teaching. That there has been such a change of emphasis is shown by the fact that whereas over one-half the papers which appeared in the Publications of the Association between 1884 and 1892 were pedagogical, now the Publications, like the other journals of the same class, are ostentatiously devoted to research. Professor Hohlfeld's contention was that neither ideal should be held to the exclusion of the other, but that both should be maintained with equal enthusiasm and at the same time. Quite in accord with the tone of the chairman's address was that of an extremely interesting paper by Professor Rambeau, director of foreign-language instruction in the Manual Training High School at Kansas City, on "The Teaching of Modern Languages in the American High School." Incidentally Professor Rambeau pointed out the dangers of the elective system now prevailing almost universally in the American high school as a result of the influence of President Eliot of Harvard. Its chief disadvantages are its expense and its tendency to encourage superficiality. He thinks we may profit by the experience of schools of a grade similar to ours abroad, particularly by that of the Realschule in Germany, because these present so close an analogy to our own high schools. Pedagogical subjects came in for still further and more detailed discussion at the departmental meetings. The informality of these sectional meetings as compared with former years, and the alert, even eager, manner of the participants in the discussion, showed conclusively that interest in them is increasing from year to year. Yet the attention of the Association was not confined to pedagogic matters. Among the most attractive papers was that presented by Professor Belden on "Folk-Song in Missouri." He has found a number of examples of ballads, some descendants of eighteenth-century English broadsides, some of native origin; the former showing curious variations from the original ballads as found in Child's collection, and all attesting the perennial hold of the ballad on a simple and illiterate people. The paper showed how a scholarly method may be applied, and important results obtained, from material apparently unpromising, and this in spite of a lack of library facilities such as are usually deemed essential conditions of productive research.

—The social element in the proceedings was, as usual, a prominent feature. At the business sessions the report of the joint committee appointed by the American Philological Association, the National Educational Association, and the Modern Language Association to consider the possibility of forming a phonetic alphabet was discussed. The report was approved and accepted, with the further suggestion that the committee consult with the various European committees with a view to securing international agreement. As officers for the ensuing year, Professor Blackburn of the University of Chicago was chosen chairman; Professor Weeks of the University of Missouri, secretary; and, as members of the executive committee, Professor Hohlfeld of the University of Wisconsin, Professor Bowen of Ohio State University, and Professor Dodge of the University of Illinois. The Association voted to accept the invitation of the University of Wisconsin to meet at Madison next year. It is probable

that thereafter, at least on alternate years, the meetings will be held in Chicago.

SIR LESLIE STEPHEN ON HOBBES.

Hobbes. By Sir Leslie Stephen. (English Men of Letters.) The Macmillan Co. 1904.

This book is the last of Leslie Stephen's delightful and philosophical biographies. One is sorely tempted to make this the opportunity for a review of Stephen's own work as a thinker; but the occasion is not really appropriate. Hobbes is too considerable a figure among the moral and political philosophers of England to be made the text for an examination into any other man's achievements. Yet it may be possible to connect together, what (to the present writer at any rate) are almost inseparable thoughts as to Stephen's unrivalled skill as a critical biographer, and reflections on the career and speculations of Hobbes. It is worth while, in any case, to direct the attention of intelligent readers who are not metaphysicians to some among the answers given by Sir Leslie Stephen to questions which are certain to perplex any student who seriously peruses the latest biography of that "Thomas Hobbes of Malmesbury, author of the 'Leviathan,'" who was admittedly "the most conspicuous English thinker in the whole period between Bacon and Locke."

Was Hobbes a man of a selfish or heartless character? There have been plenty of censors, both in his lifetime and since his death, well inclined to answer this inquiry with a decided affirmative. A whole school of moralists treat Hobbes's system of ethics as grounded on selfishness, and it is natural, though not really logical, to believe, and to assert, that a teacher who makes self-interest the basis of human action, must himself be marked by obtrusive selfishness. Hobbes, too, always appeals to men's reason; he never attempts to enlist the support of sentiment or imagination. He is a logician, he is not a rhetorician or a poet. What is more natural than to conclude that so cool-headed a teacher was deficient in kindly feeling and incapable of warm friendship? Leslie Stephen shows us at once that this idea is unfounded.

"It would be altogether unjust to set down Hobbes as a man of cold nature. Whether he was a man to make any romantic sacrifice to friendship may indeed be doubted. Retired philosophers may congratulate themselves that they are seldom exposed to such trials, and in Hobbes's life the case did not occur. But everything goes to show that he was a man of kindly if not of ardent affections. Few men appear to have won so many friends or to have retained them so permanently. His long connection with the Cavendish family proves the existence of a mutual esteem creditable to both sides. . . . Certainly we cannot claim for him the posthumous affection which is bestowed upon men of the heroic type like his contemporary Milton, or of the saintly type like Archbishop Leighton. But neither of these eminent persons made any mark in philosophical speculation. We must admit the excellence for its own purpose of more than one type. A man who is above all to be a cool reasoner and to shrink from no conclusion forced upon him by his logic, is a very valuable person, and may be forgiven if his spiritual temperature does not rapidly rise to boiling-point and obscure his clearness of vision. Hobbes, if one may venture to say so, had probably quite as much benevolence as was good for a metaphysician."

These words sum up the whole matter. Men such as Hobbes live in the world of thought; their one vocation is to think truly; their legitimate enthusiasm is the passionate search after truth. The one object of their legitimate detestation is everything which impedes free inquiry. In an age when tolerance was unknown, Hobbes denounced persecution with unsparing vigor.

Did Hobbes publish the 'Leviathan' that he might gain the favor of Cromwell? Here again the assailants of Hobbes have looked upon his conduct from the most discrediting point of view. Hobbes might be counted at one time among the Royalist exiles at Paris. He was there mathematical tutor to the Prince of Wales, afterwards Charles II. In 1650 he was anxious, and not without reason, to return to England. He published the 'Leviathan' in the middle of 1651. The book admittedly encourages or enjoins obedience to any established sovereign. The duty of a subject is to submit to the sovereign *de facto* and not to yield allegiance to the sovereign *de jure*. Hobbes, soon after publishing the 'Leviathan' retired or escaped to England, and there lived peaceably. After the Restoration, Wallis, in a controversy with Hobbes, declared that the book was "writ in defence of Oliver's title." Clarendon asserted that, at the time of the publication, Hobbes, after a discourse between jest and earnest, had, when asked why he propounded the absolutist doctrine of his treatise, said, "The truth is, I have a mind to go home." Here we have surely the evidence of willingness to sacrifice loyalty to self-interest, yet in truth Leslie Stephen demonstrates that the charge against Hobbes is little better than slander or misapprehension.

Hobbes, it is certain, never changed his principles, for the principles of the 'Leviathan' are identical with principles found in the 'De Cive,' written long before the 'Leviathan.' Hobbes, again, on the return of Charles to Paris, after the final defeat at Worcester, actually presented the King with a manuscript copy of the 'Leviathan' which is now to be seen at the British Museum, and this copy contains the passages which were the most offensive to ordinary Royalists. His retreat or escape to England, it will be said, was in itself desertion of the King. But those who make this assertion neglect certain facts. Hobbes had been banished from the King's court. The Anglican prelates found fault with the theology of his book. He had certainly attacked the Catholic Church. He stood in fear of the Catholic clergy. He thought, rightly or not, that his life was in peril. From Charles he had received little favor. The young King was set against him, and trusted in those in whom his father had trusted. Hobbes, concludes our author, "was hardly called upon to stay in a place where his countrymen and the native authorities agreed in considering him to be an atheist, and held atheism to be not only damnable, but criminal."

To those who look upon Charles I. as a martyr, and Charles II. as the King to whom every Englishman owed moral allegiance, this apology will seem insufficient. Nor to some critics who have no respect or admiration for the Stuarts will it appear so clear as it seems to have been to Leslie Stephen, that a man of Hobbes's acuteness could not recognize the full import of the victory at Worcester and see in Cromwell the true sovereign of England. But the defence suggested for Hobbes does assuredly free him from any charge of political baseness. He never was a zealot for the King; his whole moral doctrine made it the course both of wisdom and of duty to obey every *de facto* sovereign. Without any treachery he acted in accordance with his avowed principles. He possibly, too, had, even in 1651, the insight or foresight to see in Cromwell the one European ruler who wished to establish toleration in matters of religion.

Was Hobbes in truth an atheist? This is an inquiry to which persons of very different classes give opposite answers with equal confidence. The man in the street, who hardly pretends to knowledge, and represents only ignorance and tradition, is prepared to say offhand that the philosopher was certainly an infidel and probably an atheist. This, no doubt, was the belief of the electors of Southwark who, some sixty years ago, were called upon by Mr. Miall to deprive Sir William Molesworth of his seat because he had edited the works of Hobbes, the infidel. It is perhaps hardly an unfair account of the contest to write, as does Molesworth's latest biographer, that "wherever he went in the constituency, Sir William was met by the absurd cry of 'No 'obbes' from people who knew as much of Hobbes as they knew of Egyptian hieroglyphics."

The liberal theologians, who profess to speak with a certain amount of knowledge, and who maintain the doctrine, for which it is not always easy to find a strictly logical ground, that a man's religious opinions have nothing to do with his fitness to fill every political office which is open to the citizens of a State, shirk the inquiry as to Hobbes's theological creed, and either, with Sir William Molesworth, ask the question whether in Hobbes's works you can find "one single sentence hostile to Christianity," or, with Sir William's biographer, content themselves with the perfectly true, but singularly irrelevant, remark that, "in a word, Hobbes was an Erastian." The plain truth is that the fanaticism of intolerance and the much more creditable enthusiasm for religious freedom and toleration are, like every form of passion, incompatible with sound and sane criticism. If we wish to know how far and in what sense Hobbes may be charged with atheism, we must turn to an author who, equipped with complete knowledge of his subject, recognizes the constantly forgotten consideration that a critic is a judge, and that his whole duty is to give true judgment according to the evidence. Never was any man better qualified for judicial criticism than Leslie Stephen. On a matter such as the tendency of Hobbes's opinions, he writes with unrivalled authority. No one can accuse him of want of sympathy with the philosopher. Our author clearly wishes to render to Hobbes the fullest justice. He points out with characteristic equity the distinction (which will always be overlooked by mere controversialists) between the true tendency and effect of a man's doctrines and the view of these doctrines which the man himself entertained. It is impossible to reproduce the whole of Stephen's view of Hobbes's theology; it is contained in some thirteen small pages, every word of which deserves careful study. But his conclusions are expressed with as much clearness as temperance, and may be given pretty nearly in Stephen's own words.

We are in fact engaged in two different inquiries. The one, and by far the most important, is, What was the true tendency of Hobbes's teaching? The answer is this:

"If we now come to the question what was Hobbes's real position in regard to theology, I think that there can be only one answer. It is quite clear that his, like other materialistic systems, is incompatible with anything that can be called theism. His argument comes merely to this, that if the world was created—a point which, we see, he admits to be doubtful—the Creator must have been a Being of stupendous power, but one of whom we are unable to say anything else. . . . A religion of this kind is not likely to give much trouble to anybody; and Hobbes's opponents were right in regarding him as virtually opposed to all possible theology."

The other, and by far the less important inquiry, is, what Hobbes himself thought of his own position. A man may well hold dogmas which make for atheism and yet himself be a sincere deist. Leslie Stephen at any rate gives as fair a reply as the circumstances make possible:

"What Hobbes himself thought," he writes, "is not quite so obvious. There is a presumption, indeed, that so bold a thinker must have seen the plain inferences from his principles. . . . I do not, indeed, feel certain that Hobbes admitted, even to himself, the true nature of his position. He may have retained some of the horror for 'atheism' in which he had been educated, and thrown dust in his own eyes as well as in other people's. My chief reason for doubting [whether he recognized to the full the tendency of his philosophy] is that . . . he relies in his political writings upon certain doctrines as to the 'laws of God' which are apparently essential to his argument, and which could hardly be used by one to whom the words meant nothing."

If we regret that so powerful a thinker should have thrown dust in any one's eyes, we must remember, that, in Hobbes's time, free expression of opinion might mean death, and that

"it would, indeed, be difficult to blame a timid old gentleman for not courting martyrdom. The blame for reservation belongs to the persecutor more than to the persecuted. It is, I think, far more remarkable that Hobbes spoke so frankly than that he did not reveal his own mind."

To many readers, as to the present writer, it will seem that the fairest of critics has, after full examination, pronounced judgment, and that this judgment is likely to be final.

THE LETTERS OF AN EMOTIONALIST.

Letters of John Ruskin to Charles Eliot Norton. Houghton, Mifflin & Co. 1904.

The friendship between Ruskin and Professor Norton began in 1855, when the greater part of Ruskin's work as an art-critic had already been done. The first and second volumes of 'Modern Painters' had been long before the public, and the 'Seven Lamps of Architecture' and the 'Stones of Venice' were published. The third and fourth volumes of 'Modern Painters' were in preparation, and only the fifth volume was to be written later, with much groaning, as a task that had to be done, though the author was more interested in other things, and doubted if the time and labor spent on matters of art were not all wasted. It is Ruskin the social reformer, the man who found the time out of joint, and conceived himself born to set it right, that wrote the letters to Norton; and yet these letters are perhaps most valuable for the light they throw backward on Ruskin the critic. It is only ironically that Ruskin refers to himself as "the author of 'Modern Painters' "; but it is as the author of 'Modern Painters' that he is most certain to be remembered. He was far from being the greatest of art-critics—far, even, from being the greatest of critics who have written in English—but he was, for good or evil, a phenomenally effective one, and the only man who has ever been able to arouse the general public to enthusiastic interest in writings devoted to art. As a social reformer he accomplished little or nothing. As a critic he made a colossal popular reputation for a painter whose genius was hardly of a popular order, and he exercised an unmistakable influence on the art of his own country and time—two things that no other critic has done. It is because of these things that we are interested in the personality of John Ruskin, and welcome anything that helps to make this personality clearer to us.

Professor Norton, who has connected the letters by passages of explanation and comment, expressly declines the attempt to depict in words a nature "in the highest degree complex"; but one sentence in his preface gives the key, as nearly as one sentence can, to what was strongest and weakest in Ruskin. Ruskin's will, he says, "was unstable, for in him reason was subject to sentiment and often to transient emotion." It is emotion more and more dominating reason until it becomes almost hysterical, and a self-abandonment to emotion which makes the final breakdown of the reason comprehensible, which give these letters their interest and their pathos. The man who prided himself above everything on his logical powers, and who thought he proved everything he advanced by calm and clear reasoning, is always working himself into a frenzy of enthusiasm, or lashing himself into a fury of denunciation, in which reason and plain fact are alike forgotten; and the possessor of a truly remarkable gift of observation becomes incapable of distinguishing between what he sees and what he would like to see. He is quite honest, yet altogether untrustworthy, and you can believe nothing because he says so—not even that a picture contains such and such figures.

It is the acuteness of his observation of natural facts and appearances that gives all its permanent value to Ruskin's writing, but it was his emotionalism that gave him his power with the public. A strange lack of creative force prevented his becoming an original artist, but he had in the highest degree the artistic temperament, and that gift of "infecting others with his own emotion" which Tolstoy makes the criterion of art. What he believed for the moment, he believed so intensely that he thought he knew it; what he felt, he felt so profoundly that he made others feel it also. He played upon men's emotions like a musician, and made them feel and think and even do as he wished.

Yet even as an artist in words there is the same futility and the same impotence that marked the artist in lines and colors. The lack of measure, of balance, of continuity, of controlling will and formative power, prevented his producing a single book that is a work of art. He makes, at times, a great parade of method, and lays out a scheme with divisions and subdivisions, but the filling in is essentially a matter of whim and impulse. Brilliant, eloquent, eccentric, wonderfully right or completely and astonishingly wrong, he is always the artist rather than the critic, but his art is that of the *improvvisatore*, not of the composer.

Of the generosity, the sweetness, the highmindedness, the personal lovableness of the man, there are many glimpses in these letters; of his clearness and shrewdness of observation there are some; of his bitter prejudices, his unrestrained and feverish emotion, and his utter irrationalism, there are most of all, and many of them would be comic if they were not pathetic. His prejudices and his hatreds were innumerable, for they included almost everything modern, but the fiercest was his hatred of America and Americans. Indeed, this became inclusive of all the others, for he held America responsible for everything else which he disliked—even, apparently, for the decrease of the snows of Mont Blanc. He seems, rather, to have loved all the Americans he knew, but this did not prevent his hating all those he did not know. He is sure there is no hope for American art because a well-meaning young lady sent him some studies of autumn leaves, and he is convinced that all American scenery is ugly because he has seen some landscape paintings which he does not like. At the outbreak of the civil war his antagonism becomes still more intense. He writes letters which, under the circumstances, must have been a strain on friendship, and finally ceased to write altogether. After the fighting is over and friendly intercourse resumed, he says, under date of September 11, 1865: "The war has put a gulf between all Americans and me in that I do not care to hear what they think, or tell them what I think, on any matter; and Lowell's work and Longfellow's is all now quite useless to me."

Of Ruskin's sudden reversals of opinion under stress of feeling, and of his positiveness of the rightness of his present mind on any matter, there are many instances here. In 1874 he was in Assisi, where he had gone to copy Giotto. On the 19th of June he records his "discovery" of a Cimabue,

"wholly unexpected—Vasari mistaking, as usual, the place where he is, and everybody passing, as I did myself, the apparently coarse Madonna of the Scuola Greca. At last I set myself on it on a bright day and upset Giotto from his pedestal in a minute or two's close look."

Two days later he has got far enough to say:

"It may be useful to you in your own work to know what I have—I may already almost say—ascertained about him. That he [Cimabue] was a man of personal genius, equal to Tintoret, but with his mind entirely formed by the Gospels and the Book of Genesis; his art, as you know, what he could derive from Byzantine masters—and his main disposition, *compassion*. . . . Giotto is a mere domestic gossip, compared to Cimabue. Fancy the intellect of a Phidias with the soul of St. John and the knowledge of a boy ten years old. . . . I am prepared to assert her for the sublimest Mater Dolorosa ever painted, as far as my knowledge extends, in the Italian Schools."

And all this on the strength of a few days devoted to the study of a picture whose

authorship is entirely conjectural, the attribution resting on no authority but his own, and about a painter by whom no well-authenticated work exists.

As we have said, however, these letters deal more with social reform and "political economy" than with art, and it is in several letters written in August of 1869 that Ruskin's peculiarities of temperament are perhaps most clearly shown. From these we must quote at some length. First, under date of August 15, we have this:

"Meantime, look here: No one can do me any good by loving me; . . . but people do me good by making *me* love *them*—which isn't easy. Now I can't love you rightly as long as you tacitly hold me for so far fool as to spend my best strength in writing about what I don't understand. The best thing you can do for me is to ascertain and master the true points of difference between me and the political economists. If I am wrong, show me where—it is high time. If *they* are wrong, consider what that wrong extends into; and what your duty is between them and me."

Three days later he breaks out again:

"I do not (in my books) dispute Mill's morality; but I flatly deny his *Economical Science*, his, and all others of the school; I say they have neither taught, nor can teach, men *how to make money*—that they don't even know so much as what money is—or what makes it become so—that they are *not* wise men (nor—I say *here, good* men); that they have an accursed semblance of being all these, which has deceived you and thousands more of *really* good and wise men."

And a little later in the same letter:

"*Don't tell me* any more about good and wise people 'giving their lives' to the subject and 'differing from me.' They *don't differ* (look in dictionary for *Differo*) from me. They are absolutely contrary to and in *Collision* with me; they don't know the *alphabet* even of the science they profess; they don't know the meaning of one word they use; not of Economy, for they don't know the meaning of *Nomy* nor of law, nor of the verb *νέμω*; not of a House, for they have no idea of Family; not of politics, for they don't know the meaning of a city; not of money, for they don't know the meaning either of *nummus* or *pecus;* and if you were to ask Mill at this moment, he couldn't tell you the historical facts connected with the use of alloy in precious metals—he could tell you a few banker's facts, and no more.

"They don't know even the meaning of the word 'useful'—they don't know the meaning of the word 'to use,' nor of *utor*, nor *abutor*, nor *fruor*, nor *fungor*, nor *potior*, nor *vescor*. The miserable wretches haven't brains enough to be prologue to an egg and butter; and you talk of their giving their lives! They haven't lives to give; they are not alive—they are a strange spawn begotten of misused money, senseless conductors of the curse of it, flesh-flies with false tongues in the proboscis of them. Differ from *me*, indeed. Heaven help me! I am bad enough and low enough in a thousand ways, but you must know the difference between them and me, a little better, one day. And that's 'just what I mean.'"

After this display of sweet reasonableness, which may, indeed, have been partly humorous in its exaggeration, it is a little surprising to find him saying: "I do not know what it was in my last letter that gave you the impression of arrogance. I never wrote with less pride in my heart." He had already forgotten what he had written, and attributes Norton's characterization to another and earlier letter.

Such a mind and such a temper could end only in tragedy. After confusing art and religion for years, he comes to the conclusion, one day, in studying Veronese, that "positively, to be a first-rate painter—you *mustn't* be pious; but rather a little wicked, and entirely a man of the world." The discovery not only upset his belief in his own earlier teaching, and gave him a shock from the effects of which "he never wholly recovered," but it was indirectly responsible for all the misery of his later life. "In 1858," says Professor Norton, "he had had for a pet and pupil in drawing a girl ten years old, Rose La Touche, who became, as time went on, the mistress of his heart. . . . She loved him, but refused to be his wife, because, holding a strict evangelical creed, she could not make up her mind to marry a skeptic." They tortured themselves and each other until her death in 1875; then Ruskin began to dabble in spiritualism, and "got into a steady try if I couldn't get Rosie's ghost at least alive by me, if not the body of her." In 1878, through overwork, overexcitement, and the lack of all self-restraint, his brain gave way, and he suffered the first of those attacks of intermittent insanity which clouded his later years. The last letter printed here was written in 1887; the last published work in 1889, which ends with a tribute to an affection that had endured more than thirty years. "The last ten years of his life were spent in retirement, and, save for recurrent attacks of brain trouble, his days were peaceful, and not unhappy."

Dar-ul-Islam: A Record of a Journey through Ten of the Asiatic Provinces of Turkey. By Mark Sykes. London: Bickers & Son; New York: Charles Scribner's Sons. 1904. Pp. xxii, 294; many maps and photographs.

The journey here described was taken in the winter of 1902-3, and ran north from Beirut by Aleppo, Marash, Zeitun to Derendeh; thence zigzagged by Urfa, Diarbekr, Amadia, Mosul, to Sulimanieh on the south; then back by Amadia and Van to the Russian frontier, returning by Tiflis and Batum. A side journey deviated to Palmyra, and the route was highly tortuous throughout.

In the record itself three things stand out. First, certain portions of the route have been mapped with care, though only in sketches, on a scale of four to five miles to the inch. These sketch-maps extend from Aleppo to Killis, Shaykhli, Marash, Zeitun, Albistan, Hassan Shelebi, Hekim Khan, Malatia. (The spelling of these names, evidently inconsistent, is that of Mr. Sykes and his geographical editor, Professor Keane.) At Malatia there is a break, easily explained by the weather, extending to Besne, although the route-table refers to a map. From Besne to Hewek is mapped, then much-travelled ground is struck, and the next map is from Zakho north of Mosul to Amadia, to Akra, to Rezan, on the Zab; from Kalat Sherkat on the Tigris to Altin Kiopru or Kantara (both meaning much the same, 'bridge') on the lesser Zab; from Dukhon to Rania, to Rowandiz, to Rezan, all in the Zab country. These maps, with the route-tables, form a by no means inconsiderable contribution to the still uncertain geography of northern Syria and Mesopotamia.

Second, there is an admirable series of sixty-eight photographs, all of value in giving either types of scenery, agriculture, etc., or of races. They are not trivial, but to the point. But the backbone of the book consists, thirdly, of the equally photographic and immediate observations and notes of the author himself. The book was written, practically, upon the spot, and we have in it, "untouched," the sensations and ideas of a fresh and keen mind passing through these most distressful countries. Thus he has made no attempt to reduce his impressions to misleading uniformity and fallacious law. It would be easy to find inconsistencies and contradictions in them, but that has not disturbed him. So it seemed to him at one place, so otherwise at another. Generalities on races—a fruitful source of misleadings—he will not have. He has seen far too much variation where the environments were different. Of course, with all this there goes some prejudice. He is affected by the repulsion from the native Christians which every traveller feels. The virtues of the dominant races naturally appeal to him, and the too often unhappy results of Europeanizing, as in the "Gosmobaleet," move either to horror or to laughter. So, from time to time, he seems—it probably does not go far below the surface—to fail to see the permanent good in the steady work being done by missionary institutions throughout his field of view. Education, for him, is all very well, though it tends sometimes to the ridiculous, but who can resist this picturesque "tail" of an Agha: "Squatting on the floor and divan, a host of cartridge-girdled Martini-bearers grinned at us with terrier-like cheeriness"? Armenians, too, are either poor creatures without any fight in them—which is often true—or conspirators with dynamite in their boots and treachery in their hearts. The usual explanations of the massacres are given, many of which are certainly true, but the unshaken fact that they were directed and carried through by the central Government is dropped untouched. On that, Vambéry's evidence in his just published autobiography, is ample. Of Mr. Sykes's rabid Teutophobia the less said the better.

But allowances can be made. There remains a very clear-eyed and withal picturesque record of things seen and heard. A few quotations will make this plain. First, a description and a meditation, both of essential truth:

"I arrived at Rayak about 1:30, not more than an hour late, and there prepared to board the Hama train; this conveyance was filled with people, some frantically mounting, others excitedly descending from the cars. At one third-class carriage three native porters were wildly endeavoring to cram a Turkish officer, a Saratoga Trunk, a little Boy and some Loaves of bread into a compartment which already contained three Mohammedan Women, a Fruit-seller, a Zaptieh, a Barber, a Prisoner, a Native Mission teacher, the Zaptieh's saddlebags, a Sword, two Umbrellas, a Bandbox containing a Sewing Machine, the Fruit-seller's Stall, and one hundred and fifty Oranges in a cloth. The cloth had burst, and the oranges streamed through the chinks in the door not occupied by the porters wrestling with the officer; the Mohammedan ladies explained in brief that there was 'no Majesty and no Might save that of Allah, the Glorious and the Great'; the Zaptieh, who had not paid his fare, roared explanations over the Officer's shoulder; the porters thrust the Officer; the Officer pushed the fruit-seller; the Fruit-seller cast aspersions on the religion and ancestors of the Oranges; the Barber cried 'Shame!' on all for having so little self-control, while the Mission Teacher, on whom he was sitting, was too overcome to make any comment. Truly there was no engine on the train, nor was there any likelihood of its immediate movement; but it must not be

supposed that Orientals are never in a hurry; on all occasions of departure or arrival, confusion, violence, and strife reign supreme; fatalism is forgotten, and it is every man's duty to heave, to punch, to kick, to curse and swear, until the train, steamer, or caravan has started" (pp. 2-3).

Then an impression, threadbare, but renewed by a parallel:

"The whole of the route to Ma'aret en-Noman is dotted with wells and tombs, all interesting and worthy of archæological observation: it is on such a road as this that the contrast between the South African veldt and Syrian open country is so remarkable—the former empty, unmeaning, where man is an uninteresting cipher, and the only thoughts of the traveller can be of the future; but in Syria every stone has an interest, every hill has been trodden into paths, man has left his marks on every rock; the very caverns are inhabited by troglodytes, and every stage of early society is to be seen—the cave-dweller, the nomad, the semi-nomad, the villager, the townsman. No one who has the least imagination can long remain unaffected by such associations. The road from Damascus to Aleppo has seen nations rise and fall, vanish, revive, and die out; many have trodden its dusty paths, and there are more to come" (p. 52).

Then an observation, true beyond question:

"Personally, I think that the public moral sense of Europeans is practically wanting in Orientals, and unless this is assumed one cannot attempt to comprehend them; meaning that an Oriental is capable of all personal goodness, such as acts of personal friendliness, personal devotion, personal self-sacrifice, and brotherly love to those of his own creed; mercy to one's enemies and mercy in public matters is absolutely lacking. Whether this is a defect, and, if it is a defect, whether it can be remedied by education, or whether it is caused by race or religion, are questions which must be left to philosophers and men of science" (p. 78).

Another, closing a paragraph all equally to the point: "Orientals hate to be worried, and hate to have their welfare attended to—oppression they can bear with equanimity, but interference in their private affairs, even for their own good, they never brook with grace" (p. 104). Of a Jekyll and Hyde suggestiveness is this: "Indeed, it is not a good thing to know too much of Orientals; if you do, perhaps you may wake up one morning and find that you have become one. Horrible instances of this kind have occurred; and any one who has seen an Oriental European usually retires to a convenient distance to be sick" (p. 171). The truth of all which, every Orientalist, whether of the bazar or the study, will recognize. And there is very much more of the like. A solitary incomprehensible lapse is (p. 64) the denying of humor to Turks except as to the broad, practical joke. Surely Mr. Sykes has read his Nasir ed-Din Khoja. Finally, may the hope and not the fear here expressed (p. 35) for the Syrian fellahin be the event:

"They are easy to rule, and will be easy to raise from their present state of squalor, for all their faults are those of ignorance or omission; hence it is to be hoped that their future will be happier than their past—unless, indeed, the East becomes a prey to capitalists of Europe or America, in which case a designing Imperial Boss might, untrammelled by the Government, reduce them to serfdom for the purpose of filling his pockets and gaining the name of Empire-maker."

An Abridged History of Greek Literature. By Alfred Croiset, Dean of the Faculty of Letters of the University of Paris, and Maurice Croiset, Professor of Greek Literature in the State College of France. Authorized Translation by George F. Heffelbower, A.M., Professor of Greek in Carroll College. Macmillan. 1904. Pp. x, 569.

This handsome and well-printed volume is an English version of an abridgment of the 'Histoire de la Littérature Grecque,' by MM. Croiset. The original work we have no hesitation in pronouncing the best history of Greek literature that has yet been written. Its composition engaged the industry of those eminent scholars for more than twelve years, the first volume appearing in 1887, the fifth and last in 1899. Each of them took certain periods of the literature and treated them independently, but submitted his work to the counsel and revision of his colleague. Thus securing the advantages both of independence and collaboration, and each being endowed not only with the laborious patience of the professional student, but also with that fine critical insight, large sympathy, and catholicity of taste which distinguish the French savant at his best, they made the result of their joint efforts equally a boon to scholarship and to letters.

The year after their last volume appeared, MM. Croiset published an abridgment, achieved chiefly by striking out all matters of controversy and minute scholarship. The essential facts of history, and all that was most important and striking in criticism and appreciation, were retained. In other words, whereas the original is a work of reference which no one would ever think of reading through, many will read the shorter book with pleasure from cover to cover. If the reader desire information about the Erotic Fragments, or conjectures about the life of Empedocles, he should consult the five-volume edition. But if he be in quest of definite facts in regard to well-known writers, or illluminating discourse upon them, he will save time and lose nothing of importance by going to the one-volume manual.

We are compelled to say, on the other hand, that both the larger and smaller works are strangely deficient in treating the origins of the Greek people. The first words of the first chapter of the abridgment run thus: "The Hellenic race belongs to the great Aryan family, and it forms, together with the Italian race, a distinct group, characterized by two things: a close affinity of idioms and similar fundamental religious conceptions." But the theory of a Græco-Italic unity has long since been exploded, and the theory of an Italo-Celtic unity has taken its place.

"The race from which the Greeks of history sprang," we read further, "appears between the twentieth and fifteenth centuries, scattered in tribes of various names, on the coast of Asia Minor, in the islands of the Ægean Sea, in Thrace, Macedonia, and the Hellenic Peninsula. Apparently that race came from the Orient and gained possession of these territories little by little, now by land and now by sea. Although tradition would seem to unite the tribes under the common term of Pelasgi, we can be sure that they do not constitute one people. For the only bond between them was that of a common origin and language. . . . The Pelasgic period, then, was one of confused elaboration, during which the future Greek race seems to have lived, if one may so put it, in an inorganic state" (pp. 1-2).

It is hard to see how scholars who have presumably kept abreast of archæological and ethnological science for the past twenty years can make such statements as these.

Outside of this strange lapse in regard to early history, we have found nothing that calls for serious criticism. The treatment, in chapter iii., of early epic poetry and the literary conditions in primitive Greece show a fine historical as well as critical discernment. The Homeric question is fairly stated, and the conclusion of the authors is modest and conservative, as befits a subject so obscure. In connection, however, with the statement on page 46 that the vocabulary of the Odyssey is more modern than that of the Iliad, should go the qualification that the Iliad in some of its parts, notably in the whole of the ninth book, is in language and vocabulary on the same temporal plane as the Odyssey.

But the fact which most clearly proves the title of our authors to a high place among literary critics and historians, is that they are at their best in dealing with the classical period, in which they are concerned with certainties and not conjectures, and in which the Hellenic genius reached its highest intellectual development and its highest artistic expression. Of the melic poets, the tragedians, the comedians, the historians, the orators, the appreciations by MM. Croiset are delightful to read and full of instruction.

Mr. Heffelbower's translation is fluent enough, but full of infelicities when reproducing MM. Croiset's rendering of gems of Greek literature. A few examples may suffice. (P. 121) "Dainty Eros" becomes "*delicious* Eros." "Eros like a *butcher* has struck me with his great *cleavers*," seems to be due to the similarity of form between *butcher* and *bûcheron*. "*Scorning me with her lips*, turned to another," is quite absurd. (P. 136) Simonides, in his dirge over the Greeks who fell at Thermopylæ, says: "This grave holds the glory of Greece; to this Leonidas is witness." But our translator makes of it: "The urn that holds the ashes of these heroes *has the most brilliant polish that Greece can give. See if you will that of Leonidas of Sparta.*" (This sounds like a recommendation of a stove polish.) And on the same page, the *chest* in which Danaë and her infant were put into the water, becomes an "exquisitely built *wherry.*" On page 428, the *Ephemerides of* Alexander are said to be somewhat like "the *Mémoires de Dangeau* of Macedonian Epic"; but what this is, no one could say. Did the translator suppose the *Mémoires de Dangeau* to be a Macedonian epic?

The God Asclepius and the poet Asclepiades are both *Asclepias* to the translator, and that repeatedly. Milo is made to "regret his lost heifers" (p. 448), while Theocritus says that his heifers *miss Milo;* "a goat's foot wounded by a thorn" should be Battus's foot wounded by a thorn"; "Thyonichus will forget the *unfaithfulness*" should be "Thyonichus will forget his unfaithful mistress." On the next page, the wish of Theocritus that he might again attend such a harvest-home festival and again fix his winnowing shovel in the top of the pile of grain, is twisted into, "O that I *still might fan the chaff from my grain.*" And on the next page, the wish of the reaper that he were as rich as Crœsus—then he would dedicate to Aphrodite golden statues of his love and him-

self—becomes: "*'Would I were as rich as Cræsus,' men say; but even our statues, though made of gold, are adorned for Aphrodite.*"

A translation which shows such inaccuracy and such ignorance of the masterpieces of Greek literature of which it treats, should be used with extreme caution.

The Strategy of Great Railroads. By Frank H. Spearman. Charles Scribner's Sons. 1904.

Mr. Spearman is an enthusiast about American railroads, and it is difficult to escape from the contagion of his enthusiasm. He writes well, and with full and accurate knowledge of his subject, but his optimism leads him to avoid altogether or to pass lightly over the less pleasing parts of the railroad story. The book deals with nine of the great systems, viz.: the Vanderbilt, Pennsylvania, Harriman, Hill, Gould, Rock Island, Atchison, St. Paul and Northwestern. In each case full justice—perhaps more than justice—is done to the skill and sagacity which have brought about these great combinations. The remaining chapters describe the rebuilding of the Chicago & Alton as an example of judicious expenditure in bringing an old road up to the requirements of modern business; next, the difficulties overcome by the builders of the first transcontinental line; and, lastly, the early days of railroading. The last chapter gives an interesting account of the efforts made by the inhabitants of Erie, Pa., to prevent what is now the Lake Shore road from running trains through the town. Railroad companies did not find much favor in the courts of those days, and from 1853 to 1856 the efforts of the townspeople were entirely successful.

Of course it is pleasant to the patriotic mind to learn that whereas, in 1852, the Pennsylvania Railroad moved 70,000 tons of freight in a year, it now moves as much in an hour; that, as a result of modern improvements, a ton of freight is hauled forty miles for ten cents; that, owing to the "community of interest" method of conducting railroad business, the secret freight rates and rebates that built up the Standard Oil fortunes have been done away with. All these things and many others like them mark the steady development of railroad business, but Mr. Spearman does not refer to other aspects of the case which are not so cheerful. For instance, accidents are increasing more rapidly than earnings, and the number of deaths on railroads, due to preventable causes, is simply appalling. Again, the present prosperity of some of the great systems described by Mr. Spearman, notably the Harriman and the Atchison, is largely due to the drastic reorganizations of a few years ago. It is no secret that in those reorganizations the interests of security holders were ruthlessly sacrificed for the benefit of the reorganizers, and European holders (of whom there were many) still feel aggrieved over their losses, and would hardly join in Mr. Spearman's pæans over the brilliant position which the systems in question now occupy.

But, after proper allowance has been made for shortcomings attributable to Mr. Spearman's optimism, it must be said that his book is on the whole an admirable study of the American railroads of today; and we would suggest a second volume dealing with the anthracite roads, the Southern, the Illinois Central, etc., so as to cover the whole ground and establish a record of the situation as it now appears.

Theophano. By Frederic Harrison. Harper & Bros.

In the preface to a book published in 1894, Mr. Harrison, long known as a Positivist and historical essayist, stated that he had been "constantly occupied with the teaching of history since 1862." It is only such an occupation (or, to speak more truly, such an obsession) that accounts for this so-called novel. The "Widow Theophania," who takes up one sentence in Gibbon's work, here forms the main theme of 485 pages. Not unnaturally, therefore, the volume is padded to a degree that makes even the writer say: "The very enumeration of the endless stages . . . becomes intolerable." Whole chapters are devoted to processions, sieges, funerals, descriptions of Mr. Harrison's beloved Constantinople, coronations, marches, etc., in all of which the reader, unless exceptionally familiar with the history of Byzantium in the tenth century, feels, like Eric the Norwegian, one of the minor characters, that his knowledge is "far too slight and vague to enable him to follow." Of plot and characterization there is virtually none, and the dialogue serves only to impart information in the manner dear to Mr. Puff. The weight of learning goes even into the terminology, and we are confronted at every turn with such words as akritas, proto-spathaire, cathisma, and the like. Under our sense of overwhelming ignorance, it seems almost presumptuous to criticise the spelling of Appollonius and Amalphi, or to question the transliteration which produces such a word as Tzykanisterion.

This is, we believe, Mr. Harrison's first novel, and as such it is entitled to respect; but surely never was there an instance where the much study of the writer resulted in greater weariness of the reader's flesh.

The Epistles of Erasmus, from his Earliest Letters to his Fifty-first Year. English Translations by Francis Morgan Nichols. Vol. II. Longmans, Green & Co. 1904.

This second volume of Mr. Nichols's translations from the letters of Erasmus of Rotterdam will be heartily welcomed by all students of the Renaissance and all admirers of the unique genius of the writer. In the first volume, published in 1901 and noticed at the time in these columns, the editor laid down the principles which he proposed to follow in his selection and arrangement. Without making undue claims to infallibility in his results, he worked out a chronological scheme which, in the absence of all trustworthy precedent, is probably as useful as any that is likely to be invented by any other writer. It is certainly as nearly correct as the attempts of the two Germans, Richter and Reich, which, taken together, cover the ground of Mr. Nichols's two volumes. In the introduction to volume i. the editor promised a more detailed examination of Reich's book which covers the period included in volume ii., but it is a little singular that no reference is made to him in the preface to volume ii., and that, so far as we have been able to see, his name appears but once, and then in a very brief note. It is true that the chronology for this second period of Erasmus's correspondence is much more easily established than for the former period, but it would have been instructive to know where and why Mr. Nichols differs from Reich's arrangement.

The same qualities of careful rendering and intelligent conjecture mark the work of this as of the first volume, and the same little formalities and tricks of usage occur here as there. The attempt to give an idea of the course of narrative by continually changing page-headings is most praiseworthy where there is a continuous narrative, but where, as is the case here, the subject treated varies with every few lines, this practice is wasteful and confusing. Mr. Nichols seems to have a taste for putting foreign names into English, but is not consistent even here. Why say Josse Bade and Peter Gillis? On the whole, it is safer to keep to the Latin except where there is a perfectly recognized English form. Mr. Nichols falls into the usual error, that Erasmus was a counsellor of Charles V. in something more than a titular sense. In this volume appears the famous Grunnius correspondence, on which the biographers of Erasmus used to place their chief reliance for the story of his early years. We are inclined to agree heartily with Mr. Nichols in his bold assertion that this correspondence, Grunnius and all, is a pure fiction of Erasmus to cover up a plan he had much at heart, but which he did not care to bring out before the world.

It is not likely that the critical work here attempted by Mr. Nichols will be done again soon, if ever. It offers an indispensable starting-point for every future study of the great humanist.

A noteworthy novel
By the author of "Cecil Dreeme"

Mr. Waddy's Return

By THEODORE WINTHROP

Edited by **Burton E. Stevenson.** $1.50.

A novel in which may be followed the Life of Boston and Newport during the years just preceding the Civil War. Mr. Waddy, a descendant of a member of the *Mayflower's* crew, having won a fortune in India comes home to enjoy the same. He meets with adventures off the Banks and in the Shallows of the Society of that day. The editor has carefully retained the very characteristic text, his work having been very largely in the line of condensation.

Nation: "In these pages is found again **the old charm of Winthrop the writer** . . . a gay, fun-loving, crisp manner, a sound, sensible romanticism, a natural fineness, a quaint flowerliness, with an occasional flash of the youthfully lurid."

N. Y. Sun: "The reader will have no doubts as to whether this was worth doing. The shipwreck scenes, the delightful pictures of Boston before the war, are **as fresh and vivid as anything Dr. Holmes ever wrote.**"

Living Age: "Written in Mr. Winthrop's most characteristic vein, crisp, pungent, humorous, dramatic in movement and without tedious digressions."

Boston Times: "Uncommonly entertaining. There is a world of sympathy and a wealth of satire in it."

Henry Holt & Co.,
29 WEST 23D ST., NEW YORK.

An Important New Work of Timely Interest

The Monroe Doctrine

By T. B. EDGINGTON, A.M., of Memphis Bar

A very complete account, not only of the famous doctrine, its origin and interpretations, but of numerous historical events bearing upon it.—*New York World.*

The book will be valued by many as a convenient place in which to find copies of official papers which are essential to a proper understanding of this phase of American history.—*Chicago Evening Post.*

An extensive and thorough work. The record is brought down to date by the addition of a chapter showing our relations with the new state of Panama.—*St. Louis-Globe Democrat.*

In an elaborate appendix he gives letters and writings which illustrate the text, and quotes from state papers in French and English. There is an exhaustive index, so that students can readily refer to any subject mentioned. It would seem as if Mr. Edgington had covered the subject so thoroughly that there would be little need for others to write on the matter for years to come.—*Boston Transcript.*

Octavo. *360 pages.* *Cloth, $3.00 net.* *Postpaid, $3.18*

LITTLE, BROWN, & CO., Publishers, Boston.

The Governance of England

By SIDNEY LOW, B.A., late Lecturer on Modern History, King's College, London.

8vo, *net* $2.25.

An analysis of the existing system of government, with special reference to recent changes and political actualities. The volume contains an interesting and hitherto unpublished letter from the late Marquess of Salisbury, on the relations of Ministers to the House of Commons.

"A most lucid analysis of that mysterious maze of enigmas, the English Constitution. Besides Mr. John Morley, Mr. Bryce, and Mr. Low, it would be difficult to name another writer who possesses the requisite qualities."
—JAMES DOUGLAS in the *Star.*

PUBLISHED THIS WEEK—A NEW VOLUME OF

The Cambridge Modern History

Volume III. The Wars of Religion

is the new addition to "the most full, comprehensive, and scientific history of modern times in the English language, or in any other language."—*Nation.* Including this, the volumes now ready are:

Vol. I. The Renaissance

"The book will surely prove an irresistible temptation to the student of history."—*Ethical Record.*
"The best short monographs in English on their respective subjects."—*New York Times.*

Vol. II. The Reformation

"It is a fascinating volume for the student, or for the general reader who loves to inquire into the great movements that have shaped the destinies of the race."—*Brooklyn Eagle.*
"The best history of the Reformation in the English language."—*Philadelphia Public Ledger.*

Vol. III. The Wars of Religion *Just Ready.*

Among its chapter titles are: "The Wars of Religion in France"; "French Humanism and Montaigne"; "The Catholic Reaction, and the Valois and Bathory Elections, in Poland"; "The Height of the Ottoman Power"; "The Empire Under Ferdinand I. and Maximilian II."; "The Revolt of the Netherlands"; "William the Silent"; "Mary Stewart"; "The Elizabethan Naval War with Spain"; "Rome under Sixtus V."; "The End of the Italian Renaissance"; "Spain Under Philip II."; "Spain Under Philip III."; "Britain Under James I."; "Ireland, to the Settlement of Ulster"; "The Dutch Republic"; "Henry IV. of France," and "The Empire Under Rudolf II."

Vol. VII. The United States

"All things considered, no single volume of its size affords so good a history of the United States as this."—*American Historical Review.*
"The most important historical work of the year."—*Independent.*

Vol. VIII. The French Revolution

"In some respects the most satisfying of the volumes so far published . . . and there is no work which is so comprehensive and at the same time so compact and so just withal as this."
—*The Evening Post, Chicago.*

IX. Napoleon *will be the next volume issued.*

(To be complete in twelve volumes, Royal 8vo, Each, $4.00 net. Carriage 30c.)

Early Western Travels

1748-1846

A SERIES OF ANNOTATED REPRINTS of some of the best and rarest contemporary volumes of travel, descriptive of the Aborigines and Social and Economic Conditions in the Middle and Far West, during the Period of Early American Settlement.

Edited with Historical, Geographical, Ethnological, and Bibliographical Notes, and Introductions and Index, by

REUBEN GOLD THWAITES, LL.D.

With facsimiles of the original title-pages, maps, portraits, views, etc. Each volume, large 8vo, cloth, uncut, gilt tops. Price $4.00 net per volume (except the Atlas, which is $15.00 net). The edition is limited to 750 complete sets, each numbered and signed; but in addition thereto, a limited number of the volumes will be sold separately.

An Elaborate Analytical Index to the Whole

Almost all of the rare originals are without indexes. In the present reprint series, this immense mass of historical data will be made accessible through one exhaustive analytical index, to occupy the concluding volume.

"A stately series of reprints—typographically very open and handsome."—*New York Evening Post.*

"Of the editing itself one needs but to say that it is done by Dr. Thwaites, whose work with the 'Jesuit Relations,' the 'Wisconsin Historical Collections,' etc., has left him without a peer in the breadth of his scholarship and the vastness of his contributions. The editor's annotations make the present series worth possessing, even if one already owns the originals."
—*The Independent.*

Full descriptive circular and contents of the volumes mailed on application.

The Arthur H. Clark Company
Publishers, Cleveland, Ohio.

Just Published

THE MEDEA OF EURIPIDES

Edited by **Mortimer Lamson Earle,**
Professor of Classical Philology
at Columbia University

$1.25

In this edition of the Medea, special attention has been given to the reconstruction of the Greek text, in which the best authenticated conjectural readings have been incorporated. These changes, and other matters of textual criticism, are exhaustively treated in the appendices, which include also a section on the Metres, and Greek and English indexes. The notes given at the foot of each page of text, not only explain obscure meanings, but also lay stress on stylistic and dramatic matters. An extended and scholarly Introduction fully discusses the life and works of Euripides. Throughout, the human interest of the work is emphasized, and explanation and illustration, wherever possible and pertinent, are sought from archæology, history, and modern literature.

Mr. CHAMBERLAIN at Limehouse, December 15: "I ask any of you who are interested in this subject (the German working classes) to look at a book recently published by Professor Ashley, a most careful and impartial authority. There you will find everything that is known about the position of the German workman compared with that of the workman in this country."

Astronomical Discovery

By HERBERT HALL TURNER, D.Sc., F.R.S., Savilian Professor of Astronomy in the University of Oxford. 8vo. With plates. $3.00 *net*. By mail, $3.15.

The Chemical Synthesis of Vital Products and the Inter-Relations Between Organic Compounds

By RAPHAEL MELDOLA, F.R.S., V.P.C.S., F.I.C., etc., Professor of Chemistry in the City and Guilds of London Technical College, Finsbury, Member of the Faculty of Science, University of London, and of the Teachers' Registration Council. Large 8vo. $6.00 *net*. By mail, $6.22.

Vol. I. Hydrocarbons, Alcohols, and Phenols, Aldehydes, Ketones, Carbohydrates, and Glucosides, Sulphur, and Cyanogen Compounds, Camphor and Terpenes, Colouring-matters of the Flavone Group.

LONGMANS, GREEN, & CO., 93 Fifth Avenue, New York

FRENCH CLASSICS FOR ENGLISH READERS

Edited by ADOLPHE COHN, LL.B., A.M., and CURTIS HIDDEN PAGE, Ph.D.

Rabelais, Montaigne, Molière, Beaumarchais, George Sand.

The design of the series is to present the chief French authors, in the best possible translation to English readers, to meet the need of many who are interested in French literature and desire to know it directly, but who cannot easily read its authors in the original; and to fill the lack of adequate and dignified representation of these authors in public and private libraries.

Now Ready

Rabelais Including all the best chapters of his famous "Romance of Gargantua and Pantagruel" (the 17th century version of Urquhart & Motteux).

An Important New Work of Timely Interest

The Monroe Doctrine

By T. B. EDGINGTON, A.M., of Memphis Bar

A very complete account, not only of the famous doctrine, its origin and interpretations, but of numerous historical events bearing upon it.—*New York World.*

The book will be valued by many as a convenient place in which to find copies of official papers which are essential to a proper understanding of this phase of American history.—*Chicago Evening Post.*

An extensive and thorough work. The record is brought down to date by the addition of a chapter showing our relations with the new state of Panama.—*St. Louis-Globe Democrat.*

In an elaborate appendix he gives letters and writings which illustrate the text, and quotes from state papers in French and English. There is an exhaustive index, so that students can readily refer to any subject mentioned. It would seem as if Mr. Edgington had covered the subject so thoroughly that there would be little need for others to write on the matter for years to come.—*Boston Transcript.*

Octavo. 360 pages. Cloth, $3.00 net. Postpaid, $3.18

LITTLE, BROWN, & CO., Publishers, Boston.

An Important Book

THEODORE WATTS-DUNTON

THEODORE WATTS-DUNTON

A Biographical and Critical Study

By JAMES DOUGLAS

"A volume which no serious student of our contemporary literature can afford to neglect."—SIDNEY LOW in *The Standard.*

"One of the most delightful volumes of a year that was especially rich in biography."—*New York Globe.*

Business Opportunities.

PUBLISHING BUSINESS.—Publisher is open to offers for the Stock in Trade, Fixtures, Copyrights, and Goodwill of his high-class business. List includes many famous authors. Excellent opportunity for a young man with literary taste and capital. Owner's reason for disposal ill-health. Address X. Y. Z., care of the *Nation.*

The Nation.

NEW YORK, THURSDAY, JANUARY 19, 1905.

The Week.

President Roosevelt has come to the conclusion that the Panama Canal Commission was badly conceived and has worked badly. A year ago, of course, it was a monument of American sagacity in dealing with new problems; but now, it appears, the whole thing was a blunder from its birth. Undoubtedly, a strong argument for reconstructing the Commission can be made from the point of view of executive dispatch of business—to unify and centralize responsibility is the first dictate of efficient administration; but it is to be hoped that the President and Secretary of War do not share the ignorant prejudice against the eminent engineers on the Commission. There has been a foolish outcry that these experts have not "done things." They have wasted a whole year—just think of that!—in making careful studies of routes and plans, as if the true way were not to "make the dirt fly" as long as the money held out, leaving technical questions to take care of themselves. The Administration cannot be thought guilty of endorsing the wholly unfounded criticisms of the engineers, but it should beware lest its impatience to get the canal dug result in its being badly dug. It must be mortifying enough for the President to have to confess that his whole scheme for constructing the canal and governing the canal zone has broken down on his hands. Such plagues coming to him out of Panama would not, however, surprise a Greek, with his notions of Nemesis.

The long and obviously inspired statement of Judge Jones of Alabama in regard to President Roosevelt's attitude towards the South, published on Monday, is merely another proof that it is the President's policy to win back that section of the country. As we have before pointed out, this has been on the cards since the election. Mr. Roosevelt's trips to New Orleans and to Georgia, scheduled for the spring, are part of this effort to end the hostility and distrust which have existed ever since the Booker Washington incident. With Mr. Roosevelt's desire to bring about a better understanding, in both his own interest and that of the white and black residents of the States which constituted the Confederacy, everybody must sympathize who remembers that, in his treatment of the colored men aspiring to office, the President has merely stood for fair play, and for the sound American principle that the color of a man's skin shall not of itself bar him from office. The chief interest which attaches to Mr. Roosevelt's wooing of the South lies, therefore, in the manner. There has been, naturally, much curiosity to see just how far he would go in the direction of a compromise in order to bring about a reconciliation. Upon this point Judge Jones's statement may be accepted as authoritative.

Primarily, it is to be noted that the President has set his face against any reduction of the Southern representation in Congress. At least we are assured that "his Administration will be slow to countenance anything which is harmful to the Southern people," and we have a positive denial that he inspired the recently-introduced resolutions looking to that end. This is in accord with our own information about the President's attitude at this moment. It is, however, very far from being in accord with the Republican platform upon which Mr. Roosevelt was elected. This declared that the Republican party "favors such Congressional action as shall determine whether by special discriminations the elective franchise in any State has been unconstitutionally limited; and if such is the case, we demand that representation in Congress and in the electoral colleges shall be proportionately reduced, as directed by the Constitution of the United States." And Mr. Roosevelt told us last September that, though the Democratic platform was insincere, "our promises may surely be trusted." There are, of course, wide differences of opinion as to the advisability of this action; but the President's position makes it clear that, so far as he is concerned (which means Congress also) the platform, the resolutions of the Union League and the Republican Clubs, and the wishes of thousands of his followers, are to be disregarded—all in the interest of harmony with the South. Under the circumstances, we are glad to know that the President has, at least, not repented of the Booker Washington luncheon. That, Judge Jones tells us, was "not a premeditated affair." It did not mean, we learn, that the President in any way favored the admixture of the races, or "social equality" as it is termed in the South.

It was very cruel of the House to vote that retired army officers above the rank of major detailed to the militia of a State shall not draw the active pay of their grade. This was plainly aimed at Gen. Miles, who is now lending distinction to the militia of Massachusetts by acting as its inspector-general, and whose services ought surely to be worth the trifling $13,000 he would otherwise receive from the Federal Government, particularly as he has just declined to accept any pay from Massachusetts. Why the line should be drawn at majors we cannot understand. A retired colonel or brigadier-general, if physically active, may give as valuable service as any major, and, as Mr. Cockran argued, should not be discriminated against. The action of the House is all the more unpleasant because it is obviously *ex post facto*. Gen. Miles, nine brigadiers, and five colonels are now on duty in various States drawing full pay. But the House must be praised for at last awaking to the swollen retired list of the army. The number of retired brigadier-generals is about 250, and is steadily growing. The whole retired list is now 882. In 1889 there were but 490 retired officers. Since the war with Spain 479 have been pensioned. Many of the retirements with high rank have been deserved; others have been bestowed for political reasons or as a matter of pure favoritism.

Joseph Ralph Burton, United States Senator from Kansas, gets a new trial. The Supreme Court declares that there was sufficient evidence of crime to warrant conviction; but the difficulty is that the original trial court in St. Louis had no jurisdiction, because the unlawful payments were made in Washington and not in St. Louis. Justice Harlan, who dissents, holds that the payments were not completed till the checks were paid by the St. Louis bank. The decision virtually affirms Senator Burton's guilt, legal and moral, but grants him a new trial on mere technicalities. Under the circumstances, no one can blame the Kansas Legislature if it asks Burton to resign. Burton, however, has not hitherto been of the resigning kind. His theory of office-holding—as demonstrated in the evidence brought out in his trial—is to stick as long as you can, and to "work" the job for all it is worth. His enthusiasm for Senatorial perquisites is what brought him into trouble.

One passage in Gov. Johnson's inaugural message has had a startling effect upon the place-hunters of Minnesota. In it he urges upon the State Legislature the desirability of providing for an amendment to the Constitution changing the tenure of office of the Governor from two years to four, and making the incumbent ineligible for reëlection. Further, he points out the necessity for getting the amendment through before his own two years' term expires, and so cutting himself off from any chance of reelection. By these sensible recommen-

dations Gov. Johnson is said to have "sent a cold chill down the backs of many of his Democratic supporters who were looking for pie, either immediately or in the more remote future." Coming into office as the only elected representative of the Democracy in Minnesota, and in the face of an unusual Republican plurality for the national ticket, Mr. Johnson has met a hungry and numerous tribe of office-seekers. He has listened to hardly veiled threats from politicians who are warning him to be "good" to them on pain of political throttling. But this "bluff" has been met squarely in his initial message.

Few of the retiring Governors are having such kind things said of them as Gov. Aycock of North Carolina—the "educational Governor," as he has been called. The Raleigh *Biblical Recorder* declares that his voice has always been "of peace and for peace, a voice for law, a voice for justice, a voice for equal rights, and a voice, too, for the education of the disfranchised as well as the enfranchised." The *Progressive Farmer* echoes a number of dailies when it says that Mr. Aycock retires to private life "recognized by the public generally as the greatest North Carolinian since Vance." It finds that he has always dared to stand for principle, no matter what the popular clamor against his course, and describes him accordingly as a "brave and fearless statesman." These tributes seem to an observer at a distance well earned in the main, despite Gov. Aycock's connection with the disfranchisement of the blacks; for he is one of the growing number of Southerners whose attitude towards the colored people is that of helpfulness and guardianship.

President Ripley of the Atchison indignantly telegraphed to the *Evening Post* on January 4 that the action of his traffic manager, Mr. Biddle, in the case of the alleged secret rebate, was "right, legally and morally." He has since discovered, however, that there was a "technical violation of the law." Hence he has withdrawn his demand that the Interstate Commerce Commission should give him and Secretary Paul Morton a hearing, in order that they might trample upon the false charges. The incident is sufficiently instructive as it stands. We would only remark that all violations of law are "technical." Criminal statutes have a way of being exceedingly minute and verbally precise, and many a man has been sent to jail for having overlooked some nice point in the law. Railway managers ought to be tolerably familiar with the technique of the Federal statutes by this time; and for one of them to confess to a "technical violation" is scarcely less serious than to be charged, as the Atchison officials were by Commissioner Prouty, with a "barefaced violation." But where is the promised exculpatory statement of Secretary Morton? We hope that in his new zeal to punish the lawlessness in which he himself used to glory, he will not forget the public curiosity about his own plight.

The resignation of A. G. Loomis as vice-president and director of the National City Bank came none too soon. The public was shocked by the jaunty attitude of some of the friends and officers of the institution when Loomis's connection with a singularly disreputable stock-washing swindle was first made known. The excuse was offered that the bank was amply secured in its loans to the syndicate of jobbers, that the so-called "over-certification" was within the letter of the law—in short, that no criminal indictment could lie against Loomis. But in such a case the public is not concerned over technicalities. The point was, that an officer of one of the largest fiduciary institutions of the country was taken red-handed in an attempt to work off a stock of doubtful value on the messenger boys, cab drivers, and frankfurter-peddlers of Broad Street. This was the thing which troubled plain men who make no pretence to expert knowledge of legal or financial matters, and which made the resignation of Loomis necessary to save the reputation of the bank.

Returns of December's American iron production, published last week, are interesting because of their reflection of industrial conditions generally. The iron industry has, in fact, fairly fulfilled, in this curious past year, its traditional function of the "barometer of trade." In May, 1903, the country's monthly iron output reached the maximum of its history—1,713,000 tons. By December of the same year, production had actually fallen to 846,000—a decline of 50 per cent. A brief recovery last spring was followed by fresh relapse to a trifle over a million tons last July, when trade stagnation was general. From that month onward came a slow recovery. The output rose to 1,167,000 tons in August, to 1,352,000 in September, to 1,450,000 in October, to 1,480,000 in November, and finally, last month, to 1,614,000. It will be noticed that the figure is still pretty well below the maximum, and, in fact, it is not very far above the level reached in the short-lived recovery of last May. But the fact that so much lost ground has been recovered is encouraging, when one recalls how accurately the conditions of general trade have been mirrored in the iron statistics of the past two years.

The St. Louis Fair evoked a remarkable body of enlightened opinion from prominent foreign visitors. European newspapers abound in evidences of a better understanding of American conditions, never more valuable than where admiration is tempered with judicious criticism. In Vienna, Baroness von Suttner's impassioned eulogy of the United States as the land of highest ideals, making for permanent peace, has been followed by a sober examination of the causes of our material success by Dr. Kobatsch, Secretary of the Industrial Association of Lower Austria. Instead of dwelling on the "American peril," which has in the past led to the absurd anti-American leagues of Austrian and German officialdom, he advocates the formation of an "America Committee," consisting of men who know the United States, and who shall strive to bring the lessons of American ingenuity home to Austrian manufacturers. Almost equally emphatic as to the need of imitating American models in another field was the architect, Herr Hengerer, of Stuttgart, who, in a public lecture in that city, held up the modest house of the American workingman as a noteworthy example of "sound architecture, practical utilization of space, and comfort attained by simple means." He recommends in particular the introduction into Germany of our sanitary arrangements, the lack of which has kept many strangers from taking up their residence in Stuttgart. The modern private dwellings of our cities Herr Hengerer describes as "often architectural gems, though, it must be admitted, sometimes degenerating into pompous extravagance." Clubhouses, school buildings, public and charitable institutions come in for generous praise, while churches, hotels and the huge office buildings are but guardedly referred to. It is gratifying to find in Berlin, as in Vienna, warm recognition of our philanthropic endeavors, such as has been accorded to our hospitals by the eminent pathologist, Prof. Johannes Orth. He spoke of them, after his return from this country, as in many respects the most complete institutions of their kind, thus reinforcing the previous praise of Professor Lorenz of Vienna.

"For a nice, clane, aisy job," said the gentleman with the pick in the bottom of the sewer, "I'd like to be a bishop." The common illusions on this point have been dispelled by the Bishop of London, who has recently published what may be called "an episcopal balance-sheet." He states that in three years the place cost him £5,000 over and above his salary. The details of his expenditures show that his salary is eaten up by fixed charges, the extent of which must surprise the man in the ditch. The Bishop is forced to maintain Fulham Palace, not because he himself could not live in comfort in "a

small flat in the centre of London, and possibly a cottage just outside," but because he must entertain the ordination candidates; he must give great garden parties to the clergy, their wives, and their children. But, above all, he must keep up the palace and its grounds for the boys who use the field for football and cricket, and in the summer every Saturday for the hundred factory girls or boys from the slums, or tired women, or men's clubs, who have tea in the garden. The £10,000 which, according to popular fancy, enables the Bishop to roll in luxury, is more than spent, partly in enabling him to support a state suitable to his position, and partly in carrying on ecclesiastical and philanthropic enterprise. All of which goes to show that the lot of the emerged tenth is in some respects as painful as that of the submerged tenth.

The election of M. Paul Doumer to preside over the Chamber of Deputies indicated the further weakening of M. Combes's Government. On the denunciation of the Concordat and the army spy system Doumer had taken sharp exception to the Ministerial policy. He belongs to that class of Radicals which deprecates the parliamentary alliance with the Socialists. His prestige has been steadily rising of recent years. Passing from a schoolmaster's and journalist's desk to the Chamber and thence to the governorship of French Indo-China, he established a solid and brilliant record as a colonial administrator. His promotion to the presidency of the Chamber is significant, because he believes, with many of the old Moderate Republicans, that a truly Republican Government can live without the votes of the Socialist members. On this issue, the *Temps* has been conducting a poll which comes out with the above comforting assurance. M. Combes's weakness lay not merely in the distrust of his more conservative followers; the Socialists were far from easy in their loyalty. The other day, ex-Minister Millerand, in a public address, disapproved Combes's ruthless haste in breaking the historic bonds with the Vatican. The general aspect, and a bare majority after a passionate personal defence, have decided M. Combes to resign.

People who look to the price of public securities of belligerent Powers to throw some light on the actual situation in a war, may have been puzzled by the movement of Japanese and Russian bonds since Port Arthur's fall. Japanese 4 per cents rose 1½ points on the London Stock Exchange in the two or three days after the surrender, but have now gone back to the price which they held before the news. Russian 4 per cents, in the same period, fell 1 per cent., but recovered all the loss. Allowing for payment of the January coupons, both bonds now sell at the price of December 31. This might appear to mean that no importance whatever is attached in financial circles to the fall of Port Arthur. The truth is, that the markets, as their habit is, had "discounted" some weeks in advance the effect of the Japanese success. During December, Japanese bonds rose 2½ points in London, while "Russians" fell 1¾. Furthermore, the top price for the Japanese securities a fortnight ago was the highest since the outbreak of the war, and represented a rise of 16 points since April, whereas the price simultaneously touched by Russian 4s was barely 2 points above the lowest figure reached in all the period of hostilities, and marked a decline of 6 points since April. It is probable that, if a general belief had existed, on the markets, that Port Arthur's surrender meant early termination of hostilities, advance in Japanese bonds, and probably in "Russians" as well, would have been very rapid. But predictions of early peace have not had great weight.

Russian state papers, it has often been observed, are generally of an extraordinarily personal character. So the note to the Powers complaining that China has been unable to fulfil her obligations as a neutral may reasonably be interpreted as a grimace—a natural outlet for emotion in a distressing situation. But it also hints at very grave possibilities in case the war should be prolonged. What if the Czar's generals should be ordered to assist the Chinese Emperor in living up to his duties as a neutral? From a military point of view a flanking movement through northern China would have its obvious attractions. To be sure, Secretary Hay's collection of adherences to the principle of immunity for the "administrative entity" of China stands in the way. But it is doubtful if the Powers would make good their professions by force. It would be a case, indeed, in which military interference of an effective sort would be very difficult. At present, one may assume that no such design is seriously entertained. In case of another reverse near Mukden, however, and the continuation of the struggle, a descent upon Liaotung Gulf west of the present seat of operations would be a natural counsel of desperation. Accordingly, the Russian circular with its grave implications constitutes another strong argument for prompt negotiations for peace.

The German Emperor's insistence that it is the duty of the Imperial Government to bring its influence to bear upon the great coal strike now in progress in the Rhenish-Westphalian mining district, pointedly recalls what took place in Pennsylvania in 1902. True, so far as has yet appeared, there is no question of union or non-union labor involved in the German struggle. The number of possible strikers is estimated at 300,000, and of these only about 111,000 belong to the four workmen's associations. The oldest union controls 60,000 men; the Hirsch-Duncker Association, 1,000; the Polish, 10,000; and the "Christian Workers' Guild," 40,000. But in both cases the laborers locked horns with the most powerful association of mine-owners in their countries. While there are other coal-mining districts in Germany, notably in Silesia, the Rhenish-Westphalian mines are as essential to the public welfare in South Germany as are the Pennsylvania mines to the inhabitants of the eastern portion of the United States. A curtailing of the coal supply, particularly in view of the unusually severe winter weather prevailing in Germany, is certain to be widely and quickly felt, despite the use of peat, wood briquettes, and other substitutes for coal in the homes of all classes.

The Federal and State governments in Germany have a much deeper interest in this strike than had those of Pennsylvania and the United States two years ago. When Mr. Roosevelt and his advisers were casting about for a reason for his intervening, there were frequent references in the press to the need of coal for the navy as a reason why Uncle Sam should take a hand. In Germany the national and State ownership of railroads makes the various governments the largest consumers of coal. It is true, there are important public mines, particularly in Prussia's territory. That State has always pursued the policy of owning mines in the various districts within its boundaries, practically controlling all those in the Saar region and producing one-fourth of the coal mined in upper Silesia. Its recent attempt to obtain a foothold in the Rhenish-Westphalian district, the scene of the present strike, by the purchase of the Hibernia mine, came to naught last fall, as was chronicled in these columns at the time. The reasons why it sought this property are also the reasons why the sympathy of the German public is likely to be on the side of the strikers. The Rhenish-Westphalian Coal Syndicate has steadily refused to follow the Government's example in selling directly to the farmers' associations at the same prices given to the large coal dealers. A Trust, *qua* Trust, is no better beloved in Germany than in the United States. It is to be noted, also, that the disposition of the strikers is preëminently peaceable, and that they have formed their own police to aid in preventing disorder. What the Emperor will do next, since his interference failed to prevent the declaration of a wholesale strike, remains to be seen.

THE OWNERS OF THE REPUBLICAN PARTY.

Various explanations are offered of the sudden opposition in Congress to the President's plans for tariff revision. The trouble is said to be this or that; one difficulty or another is reported to be blocking action. But these pretences and excuses thinly disguise a glaring and ugly fact. The owners of the Republican party are asserting their rights of property. In a word, the protected interests, the tariff beneficiaries, have sent word to Washington that this nonsense about cutting away the abuses and monstrosities of our tariff laws must stop. The unexpected revival of the brute stand-pat doctrine in the House is not a spontaneous movement: it has all the marks of being in obedience to outside orders. Everything was going smoothly; Representative after Representative was assenting to Mr. Roosevelt's contention that the tariff should be modified, when suddenly pressure from without was applied. Then the pure mind of Gen. Grosvenor began to be filled with horrid doubts; the Pennsylvania and Ohio delegations were seized with patriotic fears; and soon the President was informed that a majority of the Republicans in the House had decided that his tariff proposals would "disturb business," and that therefore they must be dropped.

The case is clear to the close observer. This revolt against the chosen and triumphant leader of the party has nothing personal about it. The Republicans who have put their names to a document practically repudiating Mr. Roosevelt have no wish either to thwart or to humiliate him. They simply act according to the prompting of a power too mighty for them. They are creatures of the party organization, and upon that the grip of protection is firmly fastened. The men who have financed the party machine do not propose to surrender the *quid pro quo* which they got in the shape of tariff favors. They angrily ask, "May we not do what we will with our own?" And considering the Republican party as their own, they have imperatively told its leaders in Congress to quit their fooling about the tariff.

These mysterious gentlemen behind the Congressional arras do not condescend to give reasons for their edicts. As Macaulay said of Southey, reason has no place at all in their minds, as either sovereign or slave. They never trouble themselves to answer the arguments of their opponents. To them it is a sufficient account of the way in which they have arrived at their decisions to say that it is their will and pleasure to have reached them. And they work themselves up into a fine glow about the sacredness of property. Have they not bought and paid for tariff legislation? Does not the obligation of a contract exist between them and the Republican party? What, then, are we coming to if it can coolly be proposed to set aside vested rights like theirs? They have been applying their favorite methods to this tariff business; their recipe always being, when any trouble is threatened, to "go out and buy somebody or something." They have raised money to subsidize newspapers and put a first mortgage on the Republican organization. The latter they are now threatening to foreclose. That is the real secret of the antagonism with which President Roosevelt is at present confronted.

Whether he is greatly surprised at it, we do not know. He has, however, no reason to be. From the time of his first timid and somewhat vacillating references in 1902 to the desirability of tariff changes, he must have seen with what huge resentment the feasters at the protective-tariff table regarded his meddling. He was left to subside for the time being, and wrote his letter of acceptance last summer like any stand-patter of them all—though, as usual in his public utterances, he inserted a few qualifying phrases to which to point in case he changed his mind. But, after the election, he thought he was at liberty to put his own interpretation upon the verdict of approval which he received direct from the people. His passion to improve was known, and he felt that he had obtained a mandate and had the capacity to perform. Yet he must have known, if he stopped to reflect, that the great protected corporations which had used the party for their own ends, would not without a struggle allow him to employ it for the public good. To-day they face him in sullen opposition. Their puppets in Congress know where the master's crib is located, and obediently set themselves up against the elect of all the people.

The way in which the President meets this rude challenge will show what manner of man he is. It will also furnish a good index to the success or failure of his coming four years. The time for wheedling and compromise and deferred hope is rapidly passing. In the next Congress, Mr. Roosevelt will doubtless have a greater number of willing supporters. At first, anyhow, the fifty or sixty Republicans of the House who know that they rode into office solely on the coat-tails of the President, will naturally be grateful to him—although he will doubtless find, in too many cases, that their gratitude takes the form of expectation of favors to come. But the Old Guard of protection will still be there, still in control of the organization; and if it is ever to be fought and routed, Mr. Roosevelt cannot begin charging at it too soon. As its obvious game is delay, and evermore delay, his tactics should be prompt aggressiveness. And surely his point of attack is precisely this arrogant and indecent assumption of a handful of protected manufacturers that they own the Republican party, body and soul. They have placed themselves, a stolid force, athwart the path of tariff reform, in which the President, fresh from his endorsement by 7,000,000 voters, proposes to walk. It is for him to decide whether he will permit his party to be disgraced, and his great office derided, by a few men setting up their selfish wishes against his deliberate judgment and the desire of the people.

THE SENATE'S PAROCHIALISM.

Mr. Roosevelt has put his foot down in the matter of the arbitration treaties. The Senate, he says, may take them or leave them; no amendments will be considered by the Executive. On this issue every patriotic citizen should be with the President, for the amendments mooted in the Senate are, at best, as Mr. Roosevelt has written to Senator Cullom, "a mere matter of surplusage"; he might with equal truth have said that they were an expression of the generally meddlesome attitude of the Senate in all diplomatic affairs.

There is no doubt that the Senate is deliberately seeking to affirm the same extra-constitutional right of initiative over treaties that it has already established over executive appointments. In a sense, then, certain of the patches to be affixed to Mr. Hay's treaties are merely a brand which may certify to the world that the Senate claims them as its own. And the form taken by the amendment, namely, that the treaties shall not be applied to specific disputes without the consent of the Senate, is particularly despicable. It is the sign that the Senate wishes to abridge the power of the President, and, so far as possible, to exercise itself the powers of the Department of State. Evidently, a treaty which becomes operative only on the promulgation of another treaty, has the value merely of a benevolent expression of intention. Mr. Roosevelt, then, is right in preferring the outright rejection of the arbitration treaties to their emasculation.

But, to do the Senate justice, usurpation is possibly a secondary motive for this treaty tinkering. The form of the amendments excluding the State debts from the jurisdiction of arbitration manifests a peculiar parochialism; a complete failure to grasp either the letter or the spirit of the treaties; a strange inability to understand the generous aspirations of the world, as illustrated by the arbitration movement. In 'The Federalist,' LXIII., is expressed the hope that the Senate may repair America's "want of character with other nations" by considering all measures "by the light in which they would prob-

ably appear to the unbiassed part of mankind." Contrast with this pious forecast the unintelligent pettifogging about the State debts now revealed by the President's patient explanation to Senator Cullom that the treaties will naturally not supersede the Constitution. It may be felt that a certain uneasiness as to repudiated financial obligations of his own State is natural in a Senator, and that the amendments properly characterized as "surplusage" by Mr. Roosevelt are, after all, a pardonable effort to make assurance doubly sure. Let this apology go for what it is worth; no such excuse will cover an habitually sullen attitude of the Senate towards the cause of the world's peace.

The principle of arbitration is no longer in question, as it was, except with the more enlightened, perhaps, when the Senate voted down the Olney-Pauncefote treaty in 1898. That action deprived this nation of the honor of being a pioneer in the peace movement. At that time the fretful and suspicious bearing of the Senate illustrated John Jay's words—applied to those who feared the special prerogatives of that body—"However useful jealousy may be in republics, yet when, like bile in the natural, it abounds too much in the body politic, the eyes of both become very liable to be deceived by the delusive appearances which that malady casts on surrounding objects." Precisely this unreasonable distrust of a new-fangled kind of treaty seems to have actuated the upper house six years ago; to-day a repetition of the old shuffling would be tenfold more inexcusable. The stone that a parochial Senate then rejected has become the head of the corner. France, England, Italy, Germany, Switzerland, Austria are now bound by a nexus of arbitration treaties. M. Delcassé has made the framing of such conventions his chief concern; Lord Lansdowne has congratulated England because arbitration has become the fashion. Everywhere in the civilized world the movement has been greeted enthusiastically, not because it promises Utopian things, not that it can in the near future abolish war, but that it does bring under the peaceful arbitrament of international courts a large number of disputes that formerly constituted possible causes of war. In a word, the past year has strikingly confirmed Mr. Hay's foresight and practical good sense in negotiating arbitration conventions as widely as possible. Everybody worth considering, we have said, has accepted this beneficent principle. The Senate alone has refused to move on with the world; it is to-day indulging the obsolete fears of a decade ago; is treating a matter of universal import in the same spirit of ultra-parochialism with which it considers the cause of the American beet or the fish-oil industry.

The tragedy and comedy alike of the situation lie in the fact that such considerations of local interest as frequently dictate Senatorial action are absent in the matter before us. No campaign contributions will be larger or smaller, whatever the fate of Mr. Hay's treaties; no constituencies richer or poorer. In fine, the Senate opposes to the rare and tried ability of Mr. Hay and the judgment of half-a-dozen chancelleries its own declining dignity. Is it safe, it asks, to approve any agreement that will make merely Mr. Roosevelt and Mr. Hay, unassisted by Senatorial wisdom, the judges of our national honor? Can we sleep o' nights when a case may any time go before an international tribunal without the O. K. of the Sugar or the Steel Senator? The position is grotesquely untenable. Secure in apparent immunity, the Senate may once again prefer its own pique to the will of the nation as expressed by President Roosevelt. If it does so it will be merely hastening by so much the day when its method of election will be changed, and its rules so reformed that it will cease, on either parochial or merely personal ground, to be an obstructor of the world's traffic.

THE TROUBLE WITH OUR SHIPBUILDING.

Sir William H. White, the eminent English naval constructor, has been contributing to the London *Times* a series of articles on American shipbuilding, with special reference to naval construction, which embody his observations during a recent visit to this country. He is not only the leading British expert, and a former chief constructor of the royal navy, but a teacher who has especial interest in the American fleet, because some of our best constructors were once his pupils, and he himself designed two of our early cruisers. It is, therefore, worthy of note that this foreign critic has in the main only praise for our naval achievements. Of our constructors he has a very high opinion; our Government gun factory at Washington is a "fine establishment, well equipped, and well organized"; it is greatly to the credit of naval ordnance officers that they hold "such a leading position in the manufacture of guns and explosives." Some of the finest nickel-steel work yet produced was shown to Sir William; our armor-plates are "admirable in quality and uniformity"; our warships compare very favorably with the latest foreign cruisers and battleships.

All this praise will cause Mr. Roosevelt and our naval officers to rejoice. But, for the general public, aside from the assurance that the great navy we are paying for is a well-built one, Sir William White's views of our private shipyards will be of most value, at this time of depression in the industry and of discussion of Government aid to ship-owners. Calling attention to the policy of our Navy Department to encourage the development of private establishments capable of building all classes of warships, even to the extent of giving contracts to firms wholly without the staffs or establishments to undertake them at the time of the award, our English observer finds that the general result of this "bold policy has undoubtedly been satisfactory from the public point of view." While he seems to approve the Navy Department's action, some of the evils which inevitably result when an industry has been forced by the liberal bestowal of Government pap do not escape him. The owners of the fifty millions invested in the industry, we may assure Sir William White, are those, next to Mr. Roosevelt, who are most clamorous for a great navy. They are the ones, as he records, who are most anxious to prove the fallacy of the Government's plan to build some of its vessels in its own yards, and who are eagerly awaiting action on the report of the special commission to investigate the decay of our mercantile marine. For them, navy-yards are created only to make minor repairs and to refit the cruising vessels.

Sir William White was particularly impressed by the magnitude of the Newport News Shipbuilding Company's works, advertised as the largest "in the Western Hemisphere, if not in the world." He remarks, however: "At present it has very large Government contracts; but one wonders how, under existing conditions, it and the rival establishments in the United States can secure sufficient employment to give an adequate return on the capital invested." Of course, he says nothing of the water which has only just been squeezed out of the stock of many of these establishments. Elsewhere he records the growing uneasiness at signs of a decrease in the Government appropriations.

As a matter of fact, the whole shipbuilding situation in the United States is easily summed up. Great establishments have been created, not in response to an economic demand, but almost solely with a view to building warships. Half the shipyards could more than take care of all the legitimate commercial business of the country, which is limited by absurd navigation laws. The shipping industry is, moreover, protected so highly that no American may buy a ship abroad and import it unless he desires it for his pleasure. As a result, in a slack time there is acute embarrassment and a scurrying to Congress for more pap to sustain these artificially-created establishments. More battleships and more cruisers are demanded; when this supply seems to be curtailed because of a deficit in the revenue, then there are loud calls for a reviving of the merchant marine—again by wholly artificial means. New lines are to be created. Because of an in-

creased export trade? Not at all; by reason of the fact that the Republican party is willing to make good the difference between profit and loss in the running of the steamers by grants out of the general Treasury. In other words, merely for the purpose of having a great war fleet, we must pay, first, enormous sums for the ships, and then must keep on paying gratuities so that the shipyards will not go out of business.

Such a foolish economic policy carries its own punishment with it in the long run. At our present rate of naval construction, we shall soon have all the navy that even a Roosevelt can demand. It will be, moreover, almost wholly a new navy—that is, the majority of the ships will have been launched since 1899. Replacements will not keep the private shipyards busy. General arbitration treaties, or an agreement to disarm in part, would conceivably stop even this much building. Meanwhile, with the true remedies at hand, Congress thinks only how it can give public money to private businesses.

Sir William White shows in one lucid sentence how the tariff hampers our shipbuilders. He is convinced that our steel-makers produce shipbuilding steel more cheaply than the English, but finds that they sell it to shipbuilders at a price *40 to 50 per cent. greater* than the corresponding cost of shipbuilding steel in England! Thanks to this triumph of protection, English shipbuilders rub their hands in glee, and build hundreds of ships that should be the work of our own gifted engineers and constructors and our exceptionally intelligent workmen. Abolish the tariff on steel and iron; do away with the Government incentives to needless shipyards; repeal the navigation laws, and there would be no demand whatever for subsidies to shipowners and shipbuilders. Our flag would once more cover the seas.

THE WALL STREET "CURB SCANDAL."

We took occasion, at the time of the United States Shipbuilding scandal of 1903, to point out that certain experienced financiers, personally identified with that famous promotion, either were engaged knowingly in a discreditable business, or else had displayed a simplicity which would hardly be expected from a financial greenhorn. It appears to us that the same awkward alternative arises in connection with the "Montreal and Boston" promotion scandal at present in the courts. The testimony of implicated parties is now complete enough to establish conclusively the main facts in the matter, and we think they call for some decided comment.

The "Montreal and Boston" promotion was in itself an insignificant affair; it became important only because of the manner in which a fraudulent undertaking was brought near to success, and because of the very striking light which it throws on some other recent occurrences in the financial markets. The property involved consisted of some mines and mining claims, chiefly in British Columbia. On acquiring some other properties, of no great apparent value, the stock of the concern was increased from $3,000,000 to $7,500,000. This new stock sold on the Boston Exchange, last autumn, at a trifle over $1 per $5 share. The promoters, however, were looking to New York, not to Boston, and it was on the Broad Street curb that "Montreal and Boston," like United States Shipbuilding, made its spectacular appearance. As in the Shipbuilding affair, some of the active promoters were, financially speaking, mere nobodies. The man who appeared as the responsible agent in the promotion, according to his own testimony, had been a Canadian haberdasher before engaging in mining promotions. The brokers enlisted to facilitate their New York undertaking were a firm the nature of whose business might readily be inferred by the "tips" and "pointers" of their flaunting advertisements. Under these auspices, the task of "working up" the stock to three times its existing market value was begun. The procedure employed was so brazen as to result in denunciation from the "curb brokers" themselves, whose consciences are reasonably easy. It was perfectly understood by every one, except the numerous victims who were decoyed from the "outside" during the rise in the stock from $1 to $3.50 per share. It consisted in hiring one set of curb brokers to bid for the stock at rising prices, while another group would sell it, only at a continuous advance. To the simple-minded, the course of prices seemed to indicate genuine absorption; how many of them bought on the inducement of this old financial "shell-game," is purely a matter of conjecture. One of the "brokers" has testified that he paid $1 per share for stock which he was instructed to sell at once, to some one else in the game, for $3.

We should hardly devote so much space to a vulgar imposture of the sort but for the quarters in which moral if not legal complicity in the affair has been convincingly established. The one thing which puzzled even experienced watchers of "Montreal and Boston" on the curb was where the manipulators got their money, for even a mining stock cannot be "rigged" for nothing. The investigation in the court proceedings against the bankrupt Munroe house for conspiracy to defraud has shown, not only that some highly respectable financial names were signed to the "underwriting agreement" of which these curb operations were the outcome, but that the vice-president and "credit man" of the largest bank in this city was a director in the Montreal and Boston and a member of the underwriting syndicate, and that he had been granting accommodation at his bank day after day, and on the easiest terms imaginable, to the adventurers behind this shady curb undertaking. Figures showing the disreputable use made of such borrowings have been produced in court. On one day, "Munroe & Munroe," having borrowed $60,000 from the City Bank, bought 99,200 shares of their own stock on the curb and sold 94,425. Another day, they bought 94,000 shares for $271,000 and sold 87,000 for $275,000. It was a petty swindle, precisely along the lines simultaneously practised by some larger "plungers" on the Stock Exchange itself. These sordid details, however, with the figures involved duly enlarged, throw all the necessary light on the series of "million-share markets" with which our brilliant "manipulators" entertained Wall Street and the financial world at large last October.

Commenting, a month ago, on the Stock Exchange crash which followed that notorious humbug, and the responsibility which respectable banks incurred for providing the means for the inflation of the market, we observed:

> "It is no answer to say that the bank must lend to any one presenting marketable collateral, and that these people proffered such security. One does not hear of this sort of fast-and-loose use of depositors' money by the great banks of Paris and London. Our feeling is that the spectacle presented in the money market of the past two months—of notorious speculators borrowing money to buy stocks, securing those loans by the very stocks thus bought, advancing prices ten or fifteen points through the magnitude of their purchases, increasing their loans to precisely that extent because of the rise in value of the collateral, and straightway throwing into the speculative market the extra capital thus procured—is utterly discreditable to a sober banking community."

We doubt if anything could have happened which would more obviously confirm this statement of the case than the "Munroe & Munroe" episode. What the business community is likely now to ask is, What will the banking community do about it? It is alleged that the offending "credit man" of this particular episode acted on his own responsibility, and without the knowledge of his superiors. That may be so; but, very clearly, reputable banks must somehow enforce such rules as require their responsible officers to abstain from disreputable business. The injury to the whole banking community from the alliance of great banks with stock-market "rigging" need not be argued. Such incidents give too much color to the most slanderous accusations against Wall Street as a whole.

THE SIMPLE LIFE IN COLLEGE.

The story is told that a New York multi-millionaire, wishing to call on his son, an undergraduate in a New England

university, hunted up the private dormitory of which the young gentleman was an inmate. The unsophisticated elder was amazed at the magnificence of the structure. The liveried custodian—or curator—of the palace was very gracious in answer to inquiries, and promised to communicate with the lad's "man." That functionary, also in livery, regretted to say that his master was out with his footman and four-in hand. The father, however, was allowed to sit down and wait in the son's gilded parlors. When the darling boy arrived, the indulgent parent could do nothing but gasp, "How will you live when you come to New York and really have some money to spend?"

This tale we commend to the attention of the Hon. John De Witt Warner, Cornell, '72. While the simple life is being praised enthusiastically by people who would faint at the thought of living it, Mr. Warner comes forward with the suggestion that college is eminently the place to begin the good work. In a recent issue of the *Cornell Alumni News* he takes up the theme of the extravagance of college boys of to-day, and the burden which this extravagance lays upon families of modest means. "Has not the American university," he asks, "lacked of late that experience in simplicity and economy that until lately was its characteristic?" Mr. Warner does not insist that in all respects the Spartan regimen was better, but he is not happy over the fact that the expense of student life at Cornell is roughly 50 per cent. greater than it was before 1885. What he says of Cornell is, *ceteris paribus*, true of most other Eastern colleges. The money, according to Mr. Warner's investigations at Cornell, is spent on more spacious and more elaborately furnished rooms, on more expensive board, on clothing and service—"from carfare to valet attendance"—and on more costly entertainments in class, club, and society. Mr. Warner holds, however, that the modern rooms are not more healthy and comfortable than the old; that the board is "no more nourishing of brain or brawn"; and that the better wardrobe is often superfluous and in bad taste. He adds:

> "In short, a large part of the added cost that burdens parents, obstructs education, and tends to ostracize those who must deny themselves, springs from an unhealthy aping of maturity by boys, vanity that enriches the back at the expense of the head, pride in cost and possession, rather than taste for the beautiful or sense of fitness; and adds to the things which one learns to need, rather than to one's power to get what he ought to want."

From this diagnosis few careful observers will, we believe, dissent; none can deny that at the critical period of life too many young men are acquiring habits that make them the slave rather than the master of circumstances. For these evils Mr. Warner suggests two remedies: a raising of entrance requirements, and an addition to the facilities for advanced work, so as to attract more exclusively the really serious young men; and "such provision for residence and study as shall promote simplicity and economy in student life."

Mr. Warner's plan of bringing the college nearer to the level of a professional school in earnestness and quality of work has certain evident merits. Even if the standard of admission were not raised, most colleges could stiffen the curriculum and make the courses harder, without damage to the student's mind, health, or morals. Though we by no means subscribe to the theory that all soft courses should be abolished, we are convinced that many of them should. A college can be so honeycombed with them that it becomes an asylum for the lazy and incompetent, a place where the leisure of rich men's sons will suffer no great interruption. But while a curriculum so organized as to leave less time for idling would be of some help, the raising of entrance requirements would in itself do little more than thrust on the secondary schools the problem of disciplining spoiled spendthrifts.

A college dining commons and a dormitory system are what Mr. Warner has chiefly in mind as provisions to promote simplicity and economy. He would have "plain—even severe—arrangements and appointments." This is all very well, so far as it goes; but a student who will put $800 into papering a room can prove to the world that plain walls do not a prison make, nor Parker House bars a cage. To hold the lavish youth in check would call for more paternal intervention than is now usual in college. Whether such an extension of paternalism is desirable we gravely doubt. The rich have already shifted most of the responsibility for the breeding of their children upon nurses, kindergartners, school teachers, and college professors. If the father or mother will not limit allowances to minors and will not demand accountings, the college is really helpless. Its supervision of petty details of taste, and even morals, will serve merely to irritate the undergraduate without improving his habits.

The trouble lies too deep to be reached by faculty rules. Not even the wisdom of a university senate can cure the malady from which so many students suffer—foolish parents. To begin three generations back in educating a child, though obviously desirable, is impracticable. The colleges must continue to do their best with the refractory material at hand. The extravagant undergraduate is but one product of an era in which men have acquired money ten times as fast as they have acquired culture. They splurge, their wives splurge, their sons and their daughters splurge. But if our college professors and other moralists do not lose their heads—a disaster which their present salaries render unlikely—we may be saved by the slow process of education. We are optimistic enough to hope that, desperate as the outlook may be, the great-grandchildren of the people who now give monkey dinners will be well-bred and restrained students, and, after they receive their degrees, public-spirited gentlemen and scholars.

THE ECONOMIC ASSOCIATION AT CHICAGO.

January 6, 1905.

The sunshine and roses of the New Orleans meeting of 1903 of the American Economic Association, as contrasted with the blizzard and lake gale of the Chicago meeting of 1904, constituted an economic contradiction that would have satisfied even the heart of Proudhon. Beginning with an ice-edged hurricane on Tuesday night, December 27, for nearly three successive days the unwary Southerner was left doubtful only as to the relative efficacy of hospital or home treatment for pneumonia. The snows descended and the winds blew and beat upon the clans there gathered, until even the quantity theory of money and the validity of the union shop failed to develop controversial heat, and for once at least economist and sociologist found common interest in discussion of the influence of climate upon conduct. Anything short of the cordial reception and warm hospitality extended the Association by the University of Chicago and its members would, under these circumstances, have resulted in a far less successful meeting than was actually the case. As it was, a large and representative attendance enjoyed peculiar facilities for close and frequent personal association—an advantage which each successive meeting establishes more clearly as the real end of such gatherings. The programme was judiciously arranged, the papers clear and able, and the discussion, if perhaps too formal, at least thoughtful and succinct.

Beyond all question the event of the meeting was the presidential address of Professor Taussig on Wednesday evening, on "The Present Position of the Doctrine of Free Trade." In breadth of view, in sobriety of treatment, and in lucidity of expression it easily took rank as a notable deliverance. The tenor of the address is precisely indicated by the title. Forty years ago the doctrine of free trade seemed to be triumphant alike in the judgment of thinkers and in the policy of the leading countries. Since then the current has been reversed, slowly but steadily, and country after country has joined the protectionist ranks, while the change in temper among economic thinkers has been not less striking; and, so far as the doctrine of free-trade is concerned, enthusiasm has been supplanted by cautious weighing or open doubt. In succession the speaker reviewed those aspects of the tariff controversy of which most is heard in popular discussion in this country—the benefits of imports and exports, the relations of domestic and foreign industry, wages, foreign cheap labor, surplus products, overproduction, and dumping. Perfectly objective in his exposition, nowhere yielding to doctrinaire rules of thumb, pressing his analysis throughout to the recognition of the elements of truth in

opposed views—this part of the address, if nothing more than the running commentary it purported to be, was nevertheless heard and will hereafter be read as a sane and forceful contribution to a discussion marked in the past by much that is both foolish and feeble.

A typical passage in this respect was Professor Taussig's discussion of modern experience in protection to young industries. While such a policy cannot be proved useless, there are certain striking phenomena which prove it to be not indispensable. The besetting difficulty is the handicap upon all purely inductive inquiry in the doings of man: we cannot isolate causes. A protective duty may be followed by an increase of domestic production, by a new and independent industry, by an eventual benefit to the community in the way of cheaper commodities; but the question always will remain whether other causes have been at work, and whether the same result would not have ensued without the tariff in favor of the young industry.

In explanation of the strong hold which protection now has, and bids fair for some time to maintain, in European countries, Professor Taussig recognized the important influence exerted by two factors. The first of these has been the competition of new countries in agricultural products, and the other, the growth and intensification of national feeling. In the United States the maintenance of the extreme and intolerant protection which we have developed seems to be explicable chiefly on historical grounds. The system as it now stands goes back to the civil war, and is the unexpected outcome of the heavy duties then suddenly imposed. It has maintained itself chiefly by the effects of custom and iteration. The industries of the country have become habituated to it, and, what is no less important, public feeling has become habituated to it. In summary, the speaker reduced the essence of the doctrine of free trade to the proposition that, *prima facie*, international trade brings a gain, and that restrictions on it presumably bring a loss. Departures from this principle, though by no means impossible of justification, need to prove their case, and, if made in view of the pressure of opposing principles, they are matter of regret. In this sense, the doctrine of free trade, however widely rejected in the world of politics, holds its own in the sphere of the intellect.

The first regular session on Thursday morning was devoted to the theory of money, with principal papers by Professor Laughlin of Chicago, Kinley of Illinois, and Andrew of Harvard, and less formal contributions by Scott of Wisconsin, Fisher of Yale, and Carver of Harvard. The centre of debate was, naturally enough, "the quantity theory," and, if little new material figured, the opposing arguments were nevertheless aligned with unusual and gratifying clearness.

The session of Thursday afternoon devoted to the trade-union shop attracted the greatest interest. Prof. John R. Commons of Wisconsin presented an intelligent analysis of the causes of the union-shop policy, pointing out that where employment is in the hands of small competing contractors, as in the building and clothing trades, the closed shop is necessary; whereas in the stove industry, bituminous coal mines, and elsewhere, the agreements are open-shop, because the employers' associations are strong and willing enough to enforce the agreement on all of their members, which the union could do only by the strike or closed shop. Dr. John Graham Brooks discussed with characteristic sympathy and clearness the several issues involved. Mr. John Hibbard of Chicago presented a reasonable and intelligent employers' view, and Mr. Thomas Kidd of the Amalgamated Woodworkers defined a rigid and uncompromising trade-unionist attitude. In the discussion which followed, Dr. George E. Barnett of Johns Hopkins suggested that the opponents of the closed shop may be divided into two classes—those who oppose it as a part of the union's mechanism in enforcing collective bargaining, and those who regard the closed shop as synonymous with unreasonable shop rules. The unions have so long framed shop rules without conciliation that a feeling has grown up that these rules differ essentially from questions of wages and hours. This position is indefensible. The formation of employers' associations capable of dealing with such matters is the prime requisite to the extension of conciliation to cover shop rules. Where the principle of conciliation has thus been extended, the open-shop question has become unimportant.

The session on Friday morning, held jointly with the American Political Science Association, was devoted to "Corporations and Railways." Mr. Edward B. Whitney of New York reviewed the various things which Congress can probably do, negatively and affirmatively, in interference with industrial combination. Hon. Martin A. Knapp, chairman of the Interstate Commerce Commission, discussed intelligently and judiciously the regulation of railway rates, urging that the true theory of public regulation—that which is best calculated to produce useful results—is to allow the railways to unite with each other in the discharge of their public duties, thereby making it feasible and for their interest to conform in all cases to their published schedules, and to invest the regulating body with authority, after investigation of complaints upon due notice and hearing, to condemn the rates found to be actually or relatively unreasonable, and to prescribe, subject to judicial review, a substituted standard to be hereafter observed.

In a profound and original paper Prof. Henry C. Adams analyzed certain recent tendencies in the law of taxation of railways. The courts have recognized, he pointed out, the existence of a franchise or surplus value in the assessment of corporations, meaning by surplus value a value of the business as a going concern in excess of the inventory value of its physical elements. The present trend in the law of railway taxation rests upon the necessity of applying a different principle of taxation to the surplus of railways from that which is applied to the value of the physical elements which underlie it, or the value of property in general which is exposed to competition.

Preferential tariffs and reciprocity were the topics of the sixth session, on Friday afternoon. Canadian trade theory and policy in relation to the British fiscal controversy and its correlated issues were discussed by Professors Short of Queen's Unversity, Flux of McGill, and Hon. George E. Foster of Toronto, with minor notes by Willis of Washington and Lee, Emery of Yale, and Fisk of Illinois. The final session of the meeting was held jointly with the Historical Association on Friday evening in Northwestern University building. Professor Gay of Harvard presented a scholarly paper on "The Significance of the Enclosure Movement in England," and Hon. Carroll D. Wright described the economic history of the United States projected by the department of economics and sociology of the Carnegie Institution. Professors McMaster of Pennsylvania and Hull of Cornell, for the historians, and Hollander of Johns Hopkins and Seager of Columbia for the economists, took part in the discussion of Col. Wright's paper.

The officers of the Association reported encouraging conditions in its various affairs. Progress was made in dealing with the troublesome question of publication activity by authorizing the executive committee to proceed with the establishment of an Association journal, supplementary to the present monographic series, if such a step be found expedient and practicable. Professor Taussig was reëlected to the presidency, and the Association adjourned to meet in Baltimore with the Johns Hopkins University in 1905. J. H. H.

WINTER EXHIBITION OF THE ACADEMY

WATTS AND SANDYS.

LONDON, December 31, 1904.

The supply of Old Masters in England, though great, is not inexhaustible, and it must be with relief that the Royal Academy this year, for its Winter Exhibition, has an excellent reason to turn to artists who, whatever posterity may decide as to their masterliness, are certainly not "Old" in the accepted sense of the term. The Academy from time to time has reserved a room, or even all the galleries opened in winter, for the work of members who have died within the twelvemonth. This year it has lost not only Watts, of whom it can truthfully be said that he was one of the most distinguished Academicians, but also Horsley, who, though not distinguished in the least, though best known for a very absurd crusade against the nude in art, was one of the most active and efficient organizers of the shows of Old Masters, which for so long have served the Academy as a winter garment of repentance. And so, without Horsley to hunt up new Old Masters, and with Watts calling for a memorial exhibition, the problem this winter has been easily solved. The show to open next Monday (January 2) is one primarily of the "works of the late George Frederick Watts, R.A., O.M." But as the Academy has never hesitated to wear the laurels of "deceased British masters," however it may have ignored them while living, a gallery has been set aside for the works of Frederick Sandys, who also died during the summer. And, indeed, but for the outcry of artists who cared and were not afraid to speak, the chances are that Watts and Sandys would have waited while Whistler was honored. For if Whistler alive was a danger to Academicians, Whistler dead might have the virtue of bringing in shillings at the door.

As it is, Watts has the precedence, and to him five galleries are devoted. It is not

so many years since a Watts exhibition was held at the New Gallery, and a very representative collection was then got together. Nor, when alive, was Watts an artist who objected to public exhibition, like Rossetti, for instance. He sent regularly every year to the Academy, which therefore never had the excuse to treat him with the indifference that enraged Burne-Jones into resignation from the Academical ranks. He sent as regularly to the spring exhibition at the New Gallery, of which he was from the beginning one of the chief upholders and chief attractions. As a consequence, it cannot be said that the present collection at the Academy has much to tell about Watts that was not known before. A few early works that I, anyway, never remember to have seen, are included, but they only help to confirm one in the impression already formed of the manner and tendency of his development. It is amusing to see his portrait of himself at the age of seventeen (1834), undoubtedly an able piece of work for a student, though it gives no sign of any special originality of style or individuality in expression, though it reveals no seeking after the "soul" that, later on, resulted in such disaster. It is still more interesting to see other early portraits—one of Lady Frederick Cavendish Bentinck the most notable, in which the poses and the careful treatment of a lace cap point to a passing allegiance to Dutch models; or else, as with the "Augusta, Lady Castletown," in which Lawrence seems to have been striving for the mastery; while far more numerous are those revealing Italian influence—for example, the "Mother of Giorgione"; who sat for it, the catalogue does not disclose. These are the performances of the student, the able and accomplished student who has not yet found himself. And there are allegorical or mythical subjects of the same period that make one wish he never had found himself, so much better are they pictorially, so much freer from ethical encumbrance, than the work that followed. Nothing in the exhibition is more charming than a little "Aurora," a graceful goddess (or model) with orange drapery flying, attended by a swarm of *Amorini* floating in luminous space, and it bears in the catalogues the early date of 1842, though, when I first saw it, within the last very few years, I supposed it a recent work and welcomed it as a proof that ethics had not entirely closed Watts's eyes to beauty. A study for an arrangement of "Dryads and Naiads"—whether ever carried further, I cannot say—that belongs to seven years later (1849), has the same charm, and, with its romantic landscape, its figures posing for no other object than to tell in the composition, its passages of splendid color in a bit, here and there, of drapery, shows the artist still influenced by Italian masters, still absorbed in problems of beauty. Nor is it less interesting to see fragments of the cartoon "Caractacus," even if in these fragments beauty seems to have concerned him less, for the simple reason that he was trying to adapt it to mural decoration on a large scale—a more bewildering problem for the student. The cartoon made in 1842 was designed for the competition to decorate the House of Lords. It was not accepted, and, creditable though it be to the young student, perhaps it is as well for the reputation of the artist that it was not. But at least it won him one of the three prizes offered, the sum of £300, and so, by enabling him to go to Italy for further study, had not a little to do in developing his art and shaping his career.

He stayed in Italy from 1842 to 1847. It is easy to understand why, when he returned and began to exhibit his pictures, he must have made something of a stir in the art circles of London. Victorian painters were busy painting trivial little anecdotes in a trivial little way, and here was a youth who looked at the world—or tried to—through the inspired eyes of the great Florentines and Venetians; who had some sense of the dignity of form and the loveliness of color; who painted his sitters as if they were prophets and sibyls just stepped down from chapel or choir walls; who could not stoop to sentiment that had not the possibility of stateliness in its expression, or to anecdote that did not lend itself to noble lines and harmonious color schemes. Watts never associated himself nominally with the rebels of the day, the Pre-Raphaelites, though he was to a certain extent in sympathy with them and ever influenced by them. Some pictures in the present Exhibition, like the "Bianca," for example, present very much the same opulent, sensuous type that Rossetti painted and made essentially his; a picture like "Una and the Red Cross Knight" strikes one now as a reecho of the "Sir Isumbras" of Millais. But Watts never identified himself with Pre-Raphaelitism, he never accepted the creed and the methods and the subjects of the Brotherhood. Perhaps it is because he thus stood apart that he became so marked a figure among the English artists of the last half of the last century, and perhaps it is because he felt his responsibility as a marked figure, as one apart, that he became more and more absorbed in subject, more and more given to allegory, more and more ready to preach.

The Academy catalogue quotes a note written by Watts for the Catalogue of his Exhibition at the New Gallery. "The great majority of these works," it begins, "must be regarded rather as hieroglyphs than anything else, certainly not as more than symbols, which all Art was in the beginning. . . . In many cases the intention is frankly didactic." But, fortunately, art has not stood still in its first and undeveloped stage; it has long been a great deal more than hieroglyphic or symbolic; its end is beauty, not teaching and preaching. That is where Watts made his mistake. As it has happened with Ibsen in dramatic art, he gradually subordinated the artist to the teacher or the preacher, until in the end he succeeded in being neither the one nor the other. That, however didactic his intention, he was far from finding in paint the right medium for his message to humanity, is proved by the care with which his symbolic or allegoric or didactic canvases are explained in the catalogue, even when they have to do with such hackneyed themes as Faith, Hope, and Charity, Time, Death, and Judgment. On the other hand, how far, artistically, these "Symbols," with their awkward design, their cut-out forms, their harsh color, fall short of the standard the artist first set for himself, may be realized by comparing them to the early Italian experiments made before he had begun to bother about morals and meanings which have nothing to do with art.

It is the same in the portraits. A few early ones of children, and of women in the trying costume of the fifties, are full of character and grace, despite their curious primitiveness — a primitiveness of execution rather than of deliberate intention. A few, like the ever-famous "Mrs. Percy Wyndham," and, still more striking as study of character, the "Countess Somers," and the "Joachim" of 1866, and "Sir Edward Sabine" in wonderfully managed military red and decorations, and the more recent "Walter Crane," explain how, even after Watts had vowed himself to ethics, the artist in him sometimes got the better of the preacher. But in the greater number of portraits, unfortunately, preoccupation with the "soul" of the sitter led to the neglect of the more important pictorial presentment. This is felt now at the Academy, no less than at the National Portrait Gallery, where the fine exceptions always leave one wondering how it was that the man who painted them could also not only paint, but be willing to acknowledge and parade, the rest of the series. In the future, Watts's own generosity to national galleries and museums will be the worst enemy his reputation may have to face.

As I remember the New Gallery collection, it was more impressive and did greater justice to Watts, the artist, than the Academy Exhibition. Fewer works were hung at the New Gallery, and the more one sees of Watts, the more one is conscious of his serious faults and shortcomings. His meaning does not leap to the eye, his defects do. The most popular pictures are almost all here—"Hope," "Life and Love," "Love and Death," "Paolo and Francesca," the many that engravings have made known from one end of the world to the other. But they gain nothing from being seen again. If one little room were hung with only the finest things now shown, a very different impression of Watts as artist would be carried away. But to wander through room after room filled with all these mistaken sermons on canvas is to be impressed chiefly with his weakness—with the unfortunate fumbling and clumsiness and crudeness to which he was led in the endeavor to put upon canvas in paint what canvas and paint were never intended to express. It is often said, in defence of Watts, that he never found his right medium, that he should have done in fresco what circumstances compelled him to do in oil; an indifferent public and an economical Government having refused to provide him with the chance to give the world his most perfect achievement. It may be that his "Charity" and "Destiny" and "Progress" and "Mischief" and the rest would produce the desired effect if executed in fresco for a high frieze or to fill the spandrels of a lofty dome, where the heavy forms, awkward gestures and massive drapery would be modified by distance. But the fact remains that we must look at these designs as Watts gave them to us—as they are now to be seen at the Academy; that is, each as a picture within a frame. And it is impossible to look at them and then at the fine things he could and did do, and not wish that it had never occurred to him, as a duty, to suggest, "in the language of Art, Modern Thought in things ethical and spiritual."

It may have been from the Old Masters

he loved that Watts borrowed his great vigor in production, which is in such contrast to the anæmic powers—or limits—of most modern artists. Frederick Sandys, in this respect anyway, was typically modern. He produced comparatively little in the seventy years and more of his long life. Even of this little, a great deal might be, and probably will be, forgotten. His masterpieces are his illustrations, few as they are in number. For Sandys was one of the group of artists who made English illustration great in the sixties—really, the Golden Age, as it has been called. He was the friend of Rossetti and Millais and Holman Hunt, and of Whistler too. He lived with Rossetti at one time, and there is no question that his intimacy with the Pre-Raphaelites had its effect on his work, though he never gave his undivided allegiance to their principles. He was a more accomplished draughtsman than any of the Brotherhood, and the designs he drew on the wood are more perfect works of art than almost any big picture they ever painted. The greatest have a place at the Academy—"Danaë," "Amor Mundi," "Harold Harfagt," "Yet Once More Let the Organ Play," and the others—but they are seen only in the prints from the wood engravings. How much was lost in the engraving, one has a chance of learning. Sandys looked upon an illustration as of no less importance than a painting—something to be designed and executed with infinite thought and care; not to be dashed off anyhow as too trivial for him to trouble about. He made elaborate studies of figures to be introduced into the design. At times, he made a finished drawing on paper before he touched the block. Fortunately, in the Academy collection there are two or three frames, giving these studies and drawings, together with the print which was their final result. To compare Sandys's drawing in pen-and-ink with the engraver's version of it, is to deplore the loss. Much of the delicacy vanishes, the line is coarsened and becomes sadly mechanical, the spirit of the original seems to have gone out of it. The engravers of the sixties were conscientious enough, and the average of their work was good; but it needed an artist as great as Sandys to interpret his drawings. It would be interesting to see what Mr. Cole or Mr. Wolf would make of them. Of late years, when the beauty of the illustrations in *Once a Week* and *Good Words* and the shockingly got-up gift books of the period was realized by the younger illustrators at work, and many articles were written about the Men of the Sixties, it was possible to reproduce some of Sandys's drawings by process and photogravure. These, to complete the interest of the exhibition, the Academy should have hung alongside of the wood engravings. But, no doubt, the Academy considered that it had condescended sufficiently in recognizing Sandys at all, after neglecting him while he was alive, to profit by recognition.

Sandys painted a few pictures during the sixties, and they are characterized by the same fine qualities as the illustrations. The most marvellous of all is the "Portrait of Mrs. Stephen Lewis," belonging to the year 1864, and exhibited several times during the last ten years. It is a wonder of Pre-Raphaelitic detail. Millais in his most fervent days, and Holman Hunt, never equalled it. It is a small half-length of an old lady with gray hair, in a black dress and lace cap, seated in a room, all the detail of which is reflected in the mirror above the mantelpiece behind her. Even the opposite window is reflected, and the landscape seen through it is most minutely rendered. The lace cap is worked out with the elaboration and fidelity of Van Eyck or Memling. Some flowers at her side are treated with no less care. And yet Sandys succeeded, as Van Eyck and Memling succeeded, in bringing all these innumerable facts together into a harmonious whole, and in subordinating them entirely to the human interest of the portrait. The character in the old lady's face loses nothing because of the astonishing exactness with which everything about her is stated. Another presentment of an old lady, "Mrs. Clabburn," also in a white cap, is almost as amazing, though in this the detail is limited to the cap and to a spray of flowers. But in most of the other pictures and portraits (or as many as I have seen) Sandys never approached these two. I know he had high ideals of beauty—I have heard him describe the picture of the perfect woman he meant some day to paint. But in endeavoring to realize them, he came at times perilously near the old "Keepsake" or "Book of Beauty" type. And when he attempted rich, brilliant color, he was apt to overstep the bounds of reticence. He executed a number of portraits in chalk, just tinted here and there. In these there could not be the crudeness of color to which the ambitious arrangement of his paintings sometimes led, but they seem to me too often to be little more than survivals of days when sentiment and prettiness were considered essential to female beauty. Some of the portraits of men in this medium are better—for instance, the fine series of distinguished men of letters he executed for Messrs. Macmillan. But I believe that Sandys's reputation in the future will rest upon a few paintings like the "Mrs. Lewis," and, above all, upon his fine achievement as an illustrator. N. N.

Correspondence.

LAWLESSNESS AT THE TOP.

To the Editor of The Nation:

Sir: In the article entitled "What Ails America?" in your issue of December 1 you fail to suggest a very potent cause of the increase of lawlessness in our country. When the head of our Government shows an indifference to the restraints of law; when the Government, as a whole, shows an eagerness to attack a weaker nation, and, after winning the fight, boasts blatantly of its "glorious victory"; when both Congress and the Executive begin to deny the foundation theories of our laws; when the head of the Government deliberately breaks a treaty with a friendly nation, and then puts the people into possession of a part of the spoil which it had promised to protect; when, finally, he counsels the carrying of a "big stick," what *must* be the effect upon the people? Can it be supposed for one moment that such examples incline men towards respect for law? What more, for instance, does the brutal, cowardly striker want than a big stick, if it is only big enough?

Just as surely as men are conspicuous by their high office, so surely is their example of great influence, and just so surely are our high officials responsible in a great degree for the increasing lawlessness of recent years.—Respectfully,

F. J. Le Moyne.

Isham, Tenn., January 7, 1905.

UNIVERSITY AND TECHNOLOGICAL SCHOOL.

To the Editor of The Nation:

Sir: The letter of "Alumnus" in No. 2,061 of your paper has been of considerable interest to the writer of these lines. While not in a position to enter into a discussion regarding the advisability of a union between the Institute of Technology and Harvard University (although the maintenance of a Scientific School by the latter seems to be more dependent upon "tradition" than upon actual need), the writer wishes to point out that quoting the first part only of the resolution adopted by the Union of German Engineers in Berlin on the 15th of September (not Munich, September 12), as done by "Alumnus," is apt to make a wrong impression upon the reader. According to the *Beilage zur Allgemeinen Zeitung*, No. 212 (p. 519) of 1904, the resolution reads as follows:

"(1.) Es empfiehlt sich für absehbare Zeit nicht, dem Bedürfnis nach neuen technischen Hochschulen durch Angliederung technischer Fakultäten an Universitäten zu entsprechen, vielmehr ist es durch Errichtung selbständiger Anstalten zu befriedigen; denn die technischen Hochschulen würden in ihrer selbständigen Entwicklung durch Angliederung an Universitäten beeinträchtigt werden. Diese Scheidung soll jedoch die in erfreulicher Zunahme begriffene geistige Fühlung zwischen beiden Anstalten nicht hemmen. Die Angliederung an Universitäten würde auch keineswegs Ersparnisse von Bedeutung mit sich bringen.

"(2.) Der Verein Deutscher Ingenieure steht nach wie vor auf dem Standpunkt seines Ausspruches vom Jahre 1886, welcher lautet: 'Wir erklären, dass die deutschen Ingenieure für ihre allgemeine Bildung dieselben Bedürfnisse haben und derselben Beurteilung unterliegen wollen, wie die Vertreter der übrigen Berufszweige mit höherer wissenschaftlicher Ausbildung."

A protracted stay in Germany, during which exceptional opportunity was given the writer to observe present conditions, makes him inclined to ascribe the desire on the part of the engineers to have separate institutions rather than technological faculties at the universities to the mediæval methods of instruction still prevalent at the latter. The "Technische Hochschulen" are already sufficiently hampered by the social conditions imposed upon them by the universities in the shape of the "Corpsstudent." Against this influence the teachers are powerless, inasmuch as it is fostered from above, and falls in with the bureaucratic principle, which makes it almost incumbent upon a candidate for the "höhere Verwaltungskarriere" to become a member of a "corps" in good standing.

The main objection on the part of the engineers ought to be for educational reasons. Although the German authorities insist upon a university course as a preparation for the higher offices, little is done to make the time thus spent truly profitable to the student. The methods employed are still

the same as in the time when students could not obtain books. A system which requires a professor to spread over a semester's course of four lectures per week a subject which, on the basis of the "Leitfaden," could be made much more efficient in two lectures per week, is educationally wrong. It becomes morally wrong if the same professor is forced by the authorities to testify (*testieren*)—*i. e.*, to sign his name against the title of his course in the "Kollegienbuch" of any student who has paid the price exacted by the university for that course of lectures, *no matter whether the student has attended or not*, and regardless of the fact that such signatures bestow all the privileges that may be claimed by candidates for particular offices. So long as such methods prevail at the German universities, it seems clear that the polytechnic institutions, which are free from such "traditions," have a great deal to fear and nothing to gain by union with the former.

In the experience of the writer, the presence of the technological faculties at a great university is a distinct gain to all the faculties; and wherever their spiritual union is asserted in good faith by all concerned, it is sure to intensify true culture throughout the entire body of teachers and students. J. H. S.

BERKELEY, CAL., January 8, 1905.

BURTON REDIVIVUS.

TO THE EDITOR OF THE NATION:

SIR: Some of your readers may find entertainment in the following extract from an advertising letter recently sent out by a firm which manages, among other things, the 'Beacon Lights of History':

"Sir Richard Burton, who, some years ago, published for private circulation, and at prices within reach of only very wealthy collectors, that magnificent twelve-volume edition of 'The Arabian Nights' which he translated from the Persian, and which created so much discussion in England, consented, some time ago, to the printing of a second limited edition, a part of which was to be awarded to the booklovers of the United States, but not to be offered publicly for sale."

It is lucky for the author of this paragraph that Burton is dead!

G. F. MOORE.

CAMBRIDGE, January 15, 1905.

BÜRGER'S LETTERS.

TO THE EDITOR OF THE NATION:

SIR: Dr. Erich Ebstein of Göttingen is engaged in collecting and editing the correspondence of the poet Gottfried August Bürger. He has reason to believe that not a few of Bürger's letters are preserved in American libraries or are in the hands of autograph collectors in this country, and he is very anxious to obtain information about any such material. Since a new edition of Bürger's letters is much to be desired, I hope that Dr. Ebstein's appeal will not remain without result. His address is Weender Chaussee, Göttingen, Germany.

KUNO FRANCKE.

CAMBRIDGE, MASS., January 13, 1905.

Notes.

Longmans, Green & Co. will publish 'The Last Letters of Aubrey Beardsley,' with an introduction by Father Gray; 'Ghost Stories of an Antiquary,' by Montague James; 'A Handbook to Agra and the Taj,' by E. B. Havell; a 'Text-Book of Medical Practice,' by William Bain, M.D.; 'Petrol Motors and Motor Cars,' by T. Hyler White; 'Progress of the German Working Classes in the Last Quarter of a Century,' by Prof. W. J. Ashley; and 'The Tragic Drama in Aeschylus, Sophocles and Shakspere,' by Prof. Lewis Campbell.

McClure, Phillips & Co. announce 'The Complete Motorist,' by A. B. Filson Young.

A new book by Annie Payson Call, author of 'Power through Repose,' is announced by Little, Brown & Co., Boston, under the title, 'The Freedom of Life.'

Dr. Lyman Abbott's recent sermon at Harvard University, which has provoked much comment, is soon to be published in booklet form by T. Y. Crowell & Co. It is entitled "God in his World."

Dodd, Mead & Co. send us volume ii. of Dr. Thwaites's noble edition of the 'Original Journals of the Lewis and Clark Expedition, 1804-1806,' on which we have already discoursed at length. The frontispiece shows the intellectual face of William Clark, and there are several facsimiles of charts from his pencil of the Missouri and its falls. One cannot read this narrative afresh in its unchanged state without marvelling at the minuteness of the record, especially striking in the case of botanical descriptions, but also in many other ways. At page 197 the editor has an interesting note on the word *bier*, which Coues identified with the English word, but which Dr. Thwaites plausibly derives from a French word, *baire*—"that is to say, a large canvas, the ends of which," wrote the Jesuit missionary Poisson in 1727 in the Relations, "we carefully fold beneath the mattress" as a protection against mosquitoes. Elsewhere in this volume our captains speak of a "mosquito-bier," and this inverted may well have served "the Indian woman" for the child's cradle under discussion on the page cited.

The reprint of early travels in America being the fashion, it was commendable to select for A. Wessels Co.'s "Source Books of American History" 'Burnaby's Travels through North America.' The tour occupied parts of 1759-60, but in editions subsequent to the first (in 1775) changes were made with reference to the Revolution which had meanwhile occurred. These are reproduced from the edition of 1798. The author was an ancestor of the soldier-traveller, Frederick Burnaby, killed in the Sudan in 1885. He was a good observer, and his political forecasts were shrewd and sometimes verified. He entered the colonies by way of Virginia, and at Williamsburg saw Col. Byrd's house and the College of William and Mary, afterwards Princeton (Nassau Hall), and Columbia College in its infancy; and there is a bare mention of Harvard. This English clergyman observed slavery with creditable aversion, very temperately expressed, and resting as much on the provisions of the slave code as on actual scenes of wretchedness or cruelty. In the New England chapter the custom of "bundling" is described under the term "tarrying." At p. 145 he writes, of "under way": "This is usually written 'under weigh'; but I am extremely doubtful of the propriety of the phrase."

In six handy and altogether attractive 16mo volumes, Messrs. Putnams have compressed Macaulay's Essays without sacrificing the eyes, for the type is large and clear. Various portrait and other illustrations are scattered up and down, and the binding is in an excellent quiet taste. We wish only for a seventh volume—in other words, for an index, in which would lie the compliment that one who resorts to a convenient form, is not necessarily therefore among those who read only to forget and never to refer.

The eighth volume of Meyer's Konversations-Lexikon (Leipzig: Bibliographisches Institut; New York: Lemcke & Buechner) extends from Glashütte to Hautflügler. Great Britain is conspicuously treated at length, vieing with Greece; and among persons Goethe overtops every other celebrity with fifteen pages and six portraits. We are reminded by the fusion of the Goethe and Schiller Archives in 1889 that the Swiss, who have just founded a Rousseau Archive, will perhaps look in vain for a Voltaire Archive to amalgamate with it—in a less congruous manner, indeed, though these great antipathetic writers had a common bond of residence on Swiss soil. The one and a half pages devoted to the Hungarian Görgei show that this misconceived patriot is still living. Three-quarters of a page are given to General Grant, whose civil life is painted without softening. Trade (*Handel*) cuts a large figure, and there are illustrated articles on the glass industry and on gold mining. The suspended railway, variously denominated Hängebahn, Schwebebahn, and Luftbahn, in which the car body is swung below the wheels, is interestingly pictured. The range of the volume is shown by such titles as Globe Theatre (Shakspere's), globe-trotter, *go* (the Japanese game borrowed from China, and the oldest known), good-bye, *grande nation*, greenbacks, personal equation (*persönliche Gleichung*). The notice of The Hague does not forget the city's new distinction of the Conference for arbitration. Maps of glaciers and charts of the distribution of domestic animals (*Haustiere*) mingle with the customary geographical maps—British Isles, Greece, Guiana, Upper Guinea, Halle, Hamburg, Hanover, etc.

John Wiley & Sons publish three 'Untechnical Addresses on Technical Subjects,' by James Douglas, LL.D., making a slender volume of eighty-four pages. Their chief theme is mining and metallurgy, and the author pleads for the abandonment of secrecy and exclusiveness with regard to methods and processes. "As a rule, those establishments whose doors are most sedulously closed, are those least worth studying, except as technical anachronisms." Mr. Douglas exhibits in a striking manner the parallel growth of population and of the iron and steel industry of the United States under the stimulus of railroads. "If we multiply by fifty-three the number of miles of railroad in operation in 1840 and the number of tons of pig iron made in that same year by the same multiplier, we get approximately the mileage of track now in existence and the tonnage of pig iron turn-

ed out by our blast furnaces." "One single Duquesne stack turns out annually as much as the 804 little furnaces did per diem or per annum in 1840." On the Fitchburg Railroad the average freight rate in 1848 was 4.523 cents, in 1897 0.87 cent per ton mile. The third lecture deals with wastes in mining and metallurgy.

The arrangement of 'A School History of the United States,' by Prof. Wm. H. Mace (Rand, McNally & Co.), is based, "as far as practical," upon the ideas suggested in the author's work on 'Method in History.' The arrangement and the presentation strike us as very unsatisfactory. The proportion is better than in many school histories, but still leaves something to be desired. It seems to be impossible to reduce military events to anything like their proper place. In the Revolutionary period it requires thirty-six pages to relate the military events of eight years, while forty-two pages suffice for twenty-one years of peace. This proportion is, however, better than the sixty-three pages given to eight years of war between 1789 and 1865, as against the 109 pages given to the sixty-eight years of peace. The story is, on the whole, well told. Curiously enough, however, it appears more difficult to present both sides of the Revolution than of the civil war. Certainly the student will get from these pages the idea, which he probably already has, that the colonies were quite right in their contentions and in their acts, that they were quite unanimous in their resistance, and that there was no other issue involved than that of home rule. "The bolder citizens . . . formed the . . . Sons of Liberty" (p. 141); the resolutions of the Stamp Act Congress "taught the people their rights" (p. 144); "to cap the climax," Gen. Gage was sent, etc. (p. 152); "conciliation fails *in England*" (p. 154)—expressions such as these leave totally wrong impressions. As usual in books of this kind the "Regulators" movement in North Carolina is quite misunderstood (p. 147). The appendix contains a very elaborate list of questions with references, the Declaration of Independence, an analysis of the Constitution, and varied statistical material.

The appearance of 'A History Syllabus for Secondary Schools' (D. C. Heath & Co.), by a special committee of the New England History Teachers' Association, reminds us of former services which this association has rendered in much the same field. In the present work the object has been to present a carefully analyzed outline, accompanied with references, for the four school courses recommended by the Committee of Seven. There are a general introduction, special introductions for each course, lists of books, and "Bibliographical Notes and Suggestions." It is not proposed that the Syllabus should replace the text-book, but that it should supplement it. Neither is any rigid method of combining the two laid down. On the contrary, it is wisely recognized that circumstances of time and place must determine the use which can be made of the Syllabus, one of the greatest merits of which is that it is adapted to widely differing conditions. The outlines have been very carefully constructed—so highly analyzed, indeed, as to prove a trifle confusing; the selection of books is all that could be desired, and the suggestions are helpful. A few books have so recently appeared as to miss mention, such as Cheyney's 'England,' Bryce's revised 'Holy Roman Empire,' and Munro and Sellery's 'Mediæval Civilization.' For immediate practical use in a great majority of schools, the Syllabus assumes, too readily perhaps, conditions which do not exist, viz., special teachers of history, large city libraries, "historic spots," etc. It is well, however, to set a high standard; certainly the Syllabus is a book which every teacher of history in schools should possess at least, and use if possible.

The Newark (N. J.) Public Library has put forth a list of 'A Thousand of the Best Novels,' to date, ingeniously checked in the making by Denver, Springfield, and A. L. A. lists. "About 700 novels may be classed as obviously 'good,'" says Mr. J. C. Dana, in his introduction. "We think almost any reader would put about 700 of the books in this list in a list of the thousand best which he might compile. About the other 300, opinions would widely differ."

Still another list of 'Books for Boys and Girls' is that approved by the Brooklyn Public Library for use in its children's rooms. It is classified, and gives the publishers' names.

One educational use of a library, said Mr. John Morley at the opening of the public library at Plumstead on December 17, 1904, is the stimulation and improvement of public opinion. In opposition to Sir Robert Peel, who described public opinion as a "great compound of folly, weakness, prejudice, wrong feeling, right feeling, obstinacy, and newspaper paragraphs," he "thought the abundant reading of newspapers was a legitimate and entirely wholesome process, provided that it was not merely idle reading." And he made the admirable suggestion that there should be a newspaper class for the users of the library—chiefly workmen at the Government establishments in Woolwich—in which "somebody should every evening take the events recorded from all over the world in the day's newspaper and explain them, where places were, what the controversy was about, and all the other elements of the world's activity referred to in the newspaper." He deprecated the neglect of the great writers, as Shakspere, Milton, Bacon, and Locke, but did not object to the reading of fiction, which "promoted cheerfulness and good humor, for that was wanted." To cultivate a taste for poetry, he should recommend, were he librarian at Woolwich, the reader to begin with Byron. "He was not the greatest of poets, but he had daring, energy, and the historic sense, with a loathing for cant in all its forms. At the beginning of the last century he was the great central inspiring force of democracy on the Continent of Europe; and when democracy extended its reading and applied itself for inspiration to poetry, apart from the facts, needs, and demands of the day, then Byron would once more have his day."

—Dr. Allan McLaughlin, who is in the United States public health and Marine Hospital service at Washington, contributes to the January *Popular Science Monthly* a paper which cuts to the quick the fallacies of that large class who make of our foreign immigrants a scapegoat for a preponderant share of our social and political evils. From ten countries named, the percentage of illiteracy among our immigrants is but about one-third of our own general average. The native children of foreign-born parents, taking the whole foreign-born population as the basis, present but about one-eighth the percentage of illiteracy found in their parents; proving that our illiterate immigrants are quick to take advantage of the opportunity of education for their children. Indeed, the native children of foreign parentage make a better showing in this respect than the children of native white parentage: statistics of school attendance give a better record to foreign-born white children and native white children of foreign parentage than to native white children of native parentage. The charge of clannishness, and consequent lack of assimilation, of the more ignorant immigrants Dr. McLaughlin rejects, so far as it is regarded as a fault peculiar to them. "The Italian, or the Jew, or the Slav, do not shrink away from their American neighbors more than their American neighbors shrink from them." The apparent excess of criminals in our foreign-born population does not mean what it seems to mean at first sight. The vast majority of crimes among any people are committed by members of the male sex between the ages of twenty and forty-five. Now seventy-five per cent. of our immigrants are between the ages of fifteen and forty on arrival, and the males are to the females as two and one-half to one. In view of these facts, the usual comparison with our entire population in the matter of criminality is manifestly unjust. The responsibility for the "slum," often charged to the immigrant, lies with money-grasping property-owners and incompetent civic administration; the immigrant is its victim, not its parent. Naturalization frauds and kindred ills are simply our own sins, taking advantage of whatever promising material immigration may offer.

—Mr. De Vinne's notable series of helpful manuals on "The Practice of Typography" is continued with 'Modern Methods of Book Composition' (New York: The Century Co.) This, while intended principally for the craftsman, may be recommended to every author. It deals first with equipment, then with composition (general, of books, difficult—as algebra, music, pedigrees—of foreign languages), with making-up, stone-work, imposition, and, last of all, machine-composition. This final section would make old Moxon of the 'Mechanick Exercises' stare and gasp, and illustration of the subject is carried so far that we have diagrams showing the correct position of the hands for the keyboard operators. Mr. De Vinne concludes, however, that the skilled hand-compositor will always be in request. He remarks of such as are fastest when they try, that they seldom set the greatest quantity of type in a week. The minuteness of the instructions in this book, in which the expert author has had the collaboration of specialists for certain chapters, is marvellous. Thus: For ease in picking up, let the type remain, unshaken, as distributed in the case; strike the planer with the end of the handle of the mallet, not with the head; pale proofs assist in detecting imperfect letters; avoid ending the first or last line of a page or paragraph with a hyphen (when possible); avoid disagreeable white spaces by doubling the measure of the longer of two parallel columns for the excess thereof; when paragraphs are sepa-

rated by dashes, use one lead less before the dash than after it (the shoulders of the last line being equivalent to a lead); in centring a running-title, consider the page numbers as blanks. The author, too, will find duties laid on him of recasting his matter to make pages come out even or acceptably to the canons; of condensing the running-title of a left-hand page ending a chapter, etc. Like the other volumes in this encyclopædic series, the typography is exemplary for ingenuity and elegance.

—New discoveries are slowly pushing the earliest known date connected with the invention of printing back towards the traditional 1440. The fragment of an otherwise unknown Middle German poem on the Last Judgment, of which the new volume of the Publications of the Gutenberg-Gesellschaft gives a facsimile accompanied by philological, typographical and chronological studies, is printed in the same type as the 36-line Bible, the astronomical calendar for 1448, and the Paris 27-line Donatus, but in a still earlier stage while the composition is rather crude. Though of little interest from a philological and literary point of view, the importance of this find for the history of the earliest printing can hardly be overestimated. Dr. Gottfried Zedler, the author of the typographical and chronological study, assigns to it a date between 1444 and 1447. As the latter year is the probable date of the 27-line Donatus, the present piece can hardly have been printed later; as to the earlier date, the conjecture is open to some doubt. The argument is, that, as the fragment was found in Mainz, it in all probability was printed there, and as Gutenberg did not return to Mainz until 1444 or 1445, it cannot have been printed earlier. We must remember, however, that we know very little about how far Gutenberg had perfected his invention in Strassburg, and it is certainly not impossible that he brought printed sheets with him on his return to his birthplace. The same volume contains reproductions in photozincographic print of ten pages of Peter Schoeffer's 'Canon Missæ' of 1458, from the only known copy, in the Bodleian. This has no other connection with Gutenberg than the probability that he was the originator of the type. Heinrich Wallau accompanies the facsimiles with a very detailed technical study, dealing particularly with the two-colored initials and the method of printing in two colors.

—Gutenberg discoveries are seemingly in the air. At least three are given to the world in Dr. Dietrich Reichling's 'Appendices ad Hainii-Copingeri Repertorium Bibliographicum,' of which the first part is just at hand. One of these, a sheet of a Donatus, is shown by Dr. Schwenke in the December *Zentralblatt für Bibliothekswesen* to belong to the same copy as the sheet which he described in last year's publication of the Gutenberg-Gesellschaft. One of the others, 'De Statu Clericorum,' without place, printer, or date, Dr. Reichling declares without hesitation to be "ex officina Gutenbergiana, *c.* 1450." Another edition of it is described by Hain, who ascribes it, indeed, to Gutenberg, but adds two interrogation points. Reichling gives a facsimile of nine lines—reduced "about one-half"! If he had given only four lines, but in exact facsimile, it might have been possible to discuss the matter intelligently. As it is, the facsimile is worthless for the purpose of comparison, and few students would be willing to take the author's statements without further proof, which we hope the second part will supply. Reichling seems to have received a grant from the Prussian Government to search for unknown incunabula in Italian libraries. The present volume catalogues 365 such volumes, not mentioned by Hain and Copinger, and gives "Emendationes" of some 400 others which they do mention. About one-fourth of the material was found in Italian libraries, chiefly in the Vatican Library and the National Library in Naples; but not a few are from Trinity College in Dublin and the Gymnasium in Heiligenstadt, while the bulk is from the stocks (or catalogues) of two antiquarian booksellers, Leo Olschki in Florence and Jacques Rosenthal in Munich, the latter being the publisher of the volume.

—The Rogerenes were a local sect, having New London, Conn., for their habitat. They were Seventh-Day Baptists, but they held their opinions with more inclination to variation than to fixity of type. Rationality and scripturalism made that dubious mixture of their opinions which was characteristic of a century of sects and schisms. They "declined to Quakerism," but mainly in regarding its peace principles as worthy of admiration. Clearly the Quakers were nearer the kingdom of heaven in their estimation than any of the stronger sects, but the Rogerenes were sticklers for baptism and the Lord's Supper, and they were resolved to work on Sundays if they remained idle the rest of the week. In their later manifestations they were devoted to temperance and anti-slavery and the good causes generally. Their history is a pathetic one of devotion to ideas and ideals, of fines, whippings, imprisonments and other persecutions. The F. H. Gilson Company print for subscribers 'The Rogerenes, Some Hitherto Unpublished Annals belonging to the Colonial History of Connecticut.' The book consists of two parts, "A Vindication" of the Rogerenes by John R. Bolles, and a "History of the Rogerenes," by Anna B. Williams. A pious regard on the part of the latter writer for the former has burdened the book with matter which adds little to its value. From being his reader and amanuensis, in the exercise of her functions gravely questioning the importance of Mr. Bolles's researches, Miss Williams gradually acquired a lively interest in them, and on his death resolved to carry them forward and give them a more continuous and coherent presentation than that of his controversial notes. Although produced during periods of severe persecution, the Rogerene writings were, Miss Williams judges, "perfectly calm and dispassionate in tone." So were not those of their orthodox opponents, and Mr. Bolles conformed his spirit more to theirs than to that of the people whose virtues he would recommend. Miss Williams's matter, though remarkably diffuse, is a human document of unquestionable interest. Its weight goes into the opposing scale from theirs who seek to minimize the narrowness and bigotry and harshness of the Puritan theocracy. It is, moreover, eloquent of the perversion to which the characters of those offending that theocracy were subjected at the hands of personal enemies and irresponsible historians. It has much interest as a picture of colonial times over and above what is special to the New London sectaries.

—On January 9 Mr. Henry James gave his first lecture before the Contemporary Club of Philadelphia. It was literally his first essay in lecturing in public, though no one would have guessed it (writes a correspondent) from his easy and resonant delivery. "His voice is mellow and monotonous; one can listen without effort, and the complete absence of emphasis and gesture gives an agreeable impression that there is no effort on the part of the speaker. The subject was 'The Lesson of Balzac,' the great French master of us all, as Mr. James said in acknowleding his debt to the author of the 'Comédie Humaine.' But fully half the lecture was introductory to Balzac, a leisurely preamble in which Mr. James reviewed a group of novelists—George Sand, Dickens, the Brontës, Jane Austen, 'everybody's dear Jane,' but rated quite high enough, he suggested, sitting always in an arrested spring, doing woolwork, dropping stitches as she dreamed over her work, 'wool-gathering' those dropped stitches (for Mr. James, like other great men, allows himself the exuberance of puns), and so making her tapestry of human life. Her work as a whole, he said, presents no more hold for criticism than is presented by 'the surface of a smooth, bald egg.' Dickens he imagined always as calling to one's imagination a dismal large room with unwashed windows, while George Eliot one sees forever in an afternoon light, the yellow light of the close of day. Balzac is for all times and weathers; yet he is not a classic, though he has always been treated with the perfunctory admiration usually dealt out to the classics—so great that one need not read him, people decide in these days when, as Mr. James assured the members of the club, we are all writing novels of our own; they, too, the ladies who sat before him in attitudes of adoring attention. At any rate, Mr. James has proved to be his prophet. For some time it has been impossible to find a copy of Balzac at home on its shelf in the Philadelphia libraries. The passing comparison of Thackeray and Balzac was interesting. The speaker dwelt on the Frenchman's greater humanity, his fairness to a woman like his Valérie. Balzac was all for the freedom of the individual, would let a woman like that have every chance, could be in sympathy with her; whereas Thackeray had no mercy for his Becky Sharp and Blanche Amory, but delighted to scourge the 'little bare white back' of the latter. Balzac would have granted her all the privileges 'of its bareness and whiteness.' The lecture, when published, will be an entertaining and not too obscure companion to the novelist's essay on Zola."

LEE AND LONGSTREET.

Lee and Longstreet at High Tide: Gettysburg in the Light of the Official Records. By Helen D. Longstreet. Gainesville, Georgia: Published for the Author. 1904 Pp. 346.

Recollections and Letters of Robert E. Lee: By his Son, Captain Robert E. Lee.

Doubleday, Page & Co. 1904. Pp. XII., 561.

An English army officer named Fremantle was with the Confederates at Gettysburg. During the fight of the third day he rode over to the right wing and found Longstreet sitting on a rail-fence, calmly watching the battle, while some of the troops were still passing to follow up Pickett's charge. Fremantle, supposing that he had arrived at a very opportune moment, exclaimed, "I wouldn't have missed this for anything." "The devil you wouldn't," retorted Longstreet. "I would like to have missed it very much; we've attacked and been repulsed: look there!" During the more than forty years that Longstreet lived after that day, he must often have regretted that fortune brought him to Gettysburg. This was not on account of any strictly military reason or of anything that occurred during the Civil War, but of charges against him that were first made years later and were based on alleged facts as to his conduct at Gettysburg.

Of all battlefields of the Civil War, that of Gettysburg is the most picturesque and satisfactory to see; and the leading features of the main attacks of the three days can easily be carried in mind. The van of Lee's army, marching from Chambersburg in a southeasterly direction on July 1, 1863, met the advance corps of Meade's army about a mile northwest of Gettysburg. The Federals were driven through the town, but took a firm stand on Cemetery Hill, hardly a mile to the south. Before the fight was pushed with vigor, the next day, the Federal lines had taken the form of a hook, the shank of which ran along a ridge extending south from Cemetery Hill to a very high and wooded spur called Round Top, two or three miles away. The hook was made by bending the line to the east from Cemetery Hill and coming to a point near Culp's Hill. This was the Federal right wing. In front of the Federal left, Gen. Sickles made a salient on high ground, where there was a peach orchard and a wheat field, northwest of Round Top. That night the Confederates, with Ewell's corps as their left, and Hill's next, formed a semicircle running from east of Culp's Hill through Gettysburg to west of Cemetery Hill. Most of Longstreet's corps had gone into camp several miles back, and important parts of it were still much farther away.

Some conditions were favorable to making the main attack of the second day against the Federal curve, but victory might mean no more than driving Meade's army back towards Baltimore and Washington. Lee sought a victory that should put himself between his enemies and those cities. That was possible on this field only in case he could quickly swing Longstreet's corps round so as to make a long shank to the large Confederate hook and attack Sickles from the west and southwest. Of course Lee would have preferred to have this attack made at daylight, and probably expressed his wishes so strongly that some persons assumed that he had ordered it. But at daylight the main body of Longstreet's corps had eight or ten miles of marching before they could get in proper position. Reconnoitring, marching and waiting for the arrival of troops having much farther to come delayed the opening of the battle until four P. M. Then it was pushed with great vigor, the salient was driven back to the main line, and the Federal centre and extreme right were struck heavy blows; but Federal reinforcements and a lack of the needed coöperation between different parts of the Confederate line prevented an effective victory. Longstreet's corps had done the hardest fighting and achieved the only positive successes; yet expectations had not been realized, because only the salient, not the full Federal left wing, had been outflanked. Worse still, the Confederate extreme right was under the guns now planted on a rocky spur, "Little Round Top," just north of Round Top, and Federal cavalry were on the Confederate right flank.

Lee decided to fight again on the following day, striking the Federal centre with parts of Longstreet's and Hill's corps, Longstreet being in charge. There were the short, compact, and entrenched convex lines of the Federals which could easily be reinforced at any point. The Confederate lines were concave and attenuated, and the assailants would have to march in the open for a mile, always under cannon fire, which from Little Round Top was almost an enfilade. And if Longstreet should send into the attack the troops of his extreme right, opposite those hills, they would be under an enfilade fire for at least a mile, and cavalry and infantry would surely swing in behind and destroy them. Therefore Longstreet's extreme right had to hold its position to prevent the blade of the Federal jackknife from closing. Moreover, two days earlier, Longstreet had urged Lee to take the defensive several miles farther south, so as to manœuvre Meade away from his favorable ground and compel him to take the aggressive. Now, when Longstreet was ordered to attack the Federal centre, he foresaw the defeat that resulted, and it made him heartsick, and even sullen in manner. However, necessary arrangements were completed about noon, and, after the greatest cannonade the world had ever known, Pickett's charge began. At the moment when Fremantle rode up to Longstreet the first line of the attack had struck the Federal breastworks, and a small refluent wave of Confederates was coming back. That was the turning of the highest tide of the Confederacy, and the day ended with a disastrous repulse of the Southerners. Longstreet had been in command at the most important points, and no one else could be blamed because of his failure to achieve victories. But the magnanimous Lee immediately assumed all responsibility, and said to Gen. Cadmus Wilcox, who was almost overcome with grief: "Never mind, General, *all this has been my fault—it is I* that have lost this fight, and you must help me out of it in the best way you can." His relations, which had been conspicuously cordial with Longstreet, grew to be hardly less than affectionate, and so remained until death ended them.

Two or three years after Lee's death and after Longstreet had sided with Republican plans of reconstruction, Dr. William N. Pendleton, an Episcopal clergyman in Lexington, Va., where Lee died, announced in a public address that Longstreet had been ordered to begin the battle of July 2 at daylight. Pendleton was Lee's classmate at West Point, but soon took up theology and never returned to arms except during the Civil War, when, strange to say, he was Lee's chief of artillery. Stranger still, the name of this clerical soldier, *pro tem.*, is practically unknown to military history; and when Lee ordered the greatest cannonade of the war, not Gen. Pendleton but E. P. Alexander, a brilliant colonel of artillery, was put in charge of it. However, the mere declaration of such a man was sufficient to make Longstreet, already bitterly hated politically and therefore socially, almost an outlaw among Confederates not of his corps. Lesser military lights rapidly took up and enlarged the charges: Longstreet not only disobeyed orders to attack at daylight July 2, but he also did the same the next day, and sent in with Pickett only about half as many soldiers as Lee expected; he did not wish success, etc. Therefore, was he not a military traitor to the Confederacy, as he had since been a political traitor to the South?

Longstreet wielded a pen that was as powerful as his sword; but, alas, it was very bitter, and did not spare even his affectionate and magnanimous commander. This, of course, made matters worse, and there followed a thirty-years' war of ill-tempered and even furious words. In his last years Longstreet concluded to leave careful and scientific answers to all the charges. His strength failing him, his wife nominally performed the task, but the logic and force are evidently his. Excepting now and then some bitter words, the argument is concise, lucid and extremely effective. Pendleton and Gen. John B. Gordon, respectively the first and latest of Longstreet's illustrious assailants, are thoroughly refuted, and then made somewhat ridiculous. The others were less worth noticing. Had the Longstreets turned to Fremantle's published diary, they would have found valuable corroborative evidence on several points. Longstreet had both strong and weak traits, and they were much like those of General Thomas; but the mare's-nest discovered by Pendleton and exploited by Gordon is not the true description of them.

Yet there remain two kindred questions: first, did Longstreet on July 2 and 3 act with the greatest possible promptness and with all the zeal a corps commander owes his chief, no matter if defeat is foreseen? And, secondly, ought not both attacks to have been made, if made at all, mainly from the Confederate left, or at least ought not much more vigor to have been shown there while the right corps was fighting? These are questions which we happen to know have been thoroughly discussed in the unpublished memoirs of a Confederate officer very conspicuous at Gettysburg. Therefore some of the more important questions about that wonderful battlefield must be left for a future and less personal discussion.

Nearly three-fourths of Mrs. Longstreet's book does not refer to Gettysburg, and has little or no value beyond what is biographical. The long funereal appendix is the natural mistake of a mourning widow. Instead of a large octavo, the book should have been a small duodecimo, containing but the military argument. That would have found a wider circulation and been more effective.

Let the reader with an open mind now take up the 'Recollections and Letters of Gen-

eral Lee' which his son and namesake has lately published. It contains comparatively little that is new and important regarding his military conduct, but much that is interesting about his family life and his post-bellum career of a few years as president of what is now known as Washington and Lee University. Although the picture of the *vie intime* is neither very novel nor surprising to persons familiar with earlier biographies, the gently meandering narrative that connects the letters (many of which had been already published) leads us on from one pleasing subject to another until we feel quite at home in the family circle of the Lees, and can almost hear the voice of a man who was as conspicuously great in gentleness and goodness as he was in the art of war. Like that voice, the story is gentle and soothing, and it will not disappoint those who may wish to forget the horrors of war and the screech-owls of peace.

THE MARRIAGE INSTITUTION.

A History of Matrimonial Institutions, Chiefly in England and the United States. With an Introductory Analysis of the Literature and the Theories of Primitive Marriage and the Family. By George Elliott Howard, Ph.D., Professorial Lecturer in the University of Chicago, Author of 'Local Constitutional History of the United States.' Chicago: The University Press. 1904. 3 vols. Pp. xv., 473; xv., 497; xv., 449. Bibliographical index, case index, subject index.

The students in the new "Matrimonial Department" of the University of Chicago, to which Professor Howard has just presented the 1,700 volumes collected by him in the course of his investigations into the history of human marriage, are fortunate in possessing also the excellent résumé of so much of this material constituting the work now under review. The best treatises on human marriage written in the English language have an individuality about them seldom attained in some other fields of sociological research. Professor Howard's volumes illustrate this fact, as did the earlier studies of Crawley and Westermarck. His object is primarily "to trace the development of the family and marriage in the three homes of the English race," namely, ancient Teutonia, England, and the United States. Part I. consists of an "Analysis of the Literature and the Theories of Primitive Matrimonial Institutions," appreciative, often acute, nearly always well done. Part II. treats "Matrimonial Institutions in England" (free marriage, ecclesiastical marriage, Protestant conception of marriage, separation, and divorce); and Part III. discusses "Matrimonial Institutions in the United States," taking up in succession the obligatory civil marriage of the New England colonies, ecclesiastical rites, and the rise of civil marriage in the Southern colonies, the optional civil or ecclesiastical marriage in the middle colonies, divorce in the American colonies, marriage and divorce legislation in the United States, 1776-1903. In the section (pages 161-259 of volume iii.) on "Problems of Marriage and the Family," the state of the question to-day is considered, and the author's own sociological views crop out.

Professor Howard rightly emphasizes the "perils of historical narrative" in sociological studies, and the pitfalls of inference which have been the ruin of more than one theory of uniform social progress and doctrine of universal stages of evolution. The institutions and customs of human marriage have misled in these directions not a few brilliant scholars and investigators, who have mistaken the experimental for the permanent, and the local for the universal The problems of human society "can only be solved by appealing to the laws of human life and organic evolution." For this reason, the theory of "the pairing family" set forth so ably in the really epoch-making works of Starcke and Westermarck must prevail against the "horde and mother-right" theory, which first found classical expression in Bachofen's 'Mutterrecht,' and the notorious "patriarchal theory," associated particularly with the name of Sir Henry Maine, though its literature begins, as Professor Howard notes, with Filmer's 'Patriarchia' (London, 1680), a royalist *Tendenzschrift*, which was duly castigated by Locke a few years later. A better understanding of Darwinism and the laws of human evolution has, in recent years, given the deathblow to several ingenious hypotheses of original promiscuity. Past all incidents and accidents of age and environment, of historical experience and race-intermixture, of religious and political prejudices, of sexual aberration and social tyranny, we can now look back, with reasonable certainty, to primitive man as exemplifying in matrimonial affairs the same instincts and the same practices in general as does the man of to-day. We can affirm, therefore, that "marriage or pairing between one man and one woman, though the union be often transitory and the rule frequently violated, is the typical form of sexual union from the infancy of the human race." In marriage man is essentially man, and its *modi operandi* are human methods and devices. The coexistence of clan-exogamy and tribal endogamy springs from the "horror of sexual union between persons who are too near, and the dislike of connection between those who are too remote"—feelings co-existent even now among civilized men and women. Here, too close is as dangerous as too far. Professor Howard agrees with Westermarck in assigning an important rôle to sympathy in "widening the sphere of sexual selection"—sympathy stimulated by an increasing likeness in the interests, ideas, sentiments, and general culture of mankind.

Polyandry and polygeny appear to be relatively unimportant factors in human sociological history. The latter, our author states, "is not a mere limitation of promiscuity, as some writers believe, but usually makes its appearance comparatively late in social history," and the social importance of both has been exaggerated. Polygeny, of course, has been more widespread than polyandry, and it has at times been favored by such circumstances as the existence of a surplus of women, lack of jealousy among women, men's desire for offspring, the restorative instinct after wars, etc. But woman's natural jealousy and her instinctive knowledge of the best form of human marriage will always cast the die in favor of monogamic sexual relations. In like manner, the "consent of woman as the normal condition of matrimonial union is never entirely destroyed by wife-purchase"—or, indeed, by any other limiting customs or institutions. For woman is always more clearly woman than man is man. Finally, Professor Howard tells us, after careful study of his abundant material: "In short, whether regarded historically or biologically, monogamy and self-betrothal appear simply as two aspects of the same institution; they are connected by a psychic bond, and together they constitute the highest type of marriage and the family." This is an eminently sane and just conclusion, both for the beginnings of the race and for its present-day life.

As to divorce, the "practically universal rule among uncivilized races that the repudiated wife, or the woman who legally puts away her husband, shall return to her own family or clan, whose duty it is to receive her," makes her condition in the lower stages of human culture not so isolated as it is often in the highest civilized society of to-day. The history of English marriage shows that it ends, as it began, in a simple contract, but with the condition of publicity added by the state after the church had largely failed to accomplish this end. In the United States, the common-law marriage, a procedure of great anarchical possibilities, has been sanctioned or favored by twenty-three States and Territories, while twelve others look that way; on the other hand, eighteen have repudiated or seem inclined to repudiate such informal agreements. It is, however, still necessary to "create or further develop a sound popular sentiment in favor of proper social control of the marital relation," such control to be afterwards crystallized in mandatory statutes with no loopholes for evasion. In the United States, typical of western civilization, "marriage and the family are emerging as purely social institutions," and the problems involved in them are "identical in kind with those which have everywhere concerned men and women from the infancy of the race." Matrimonial forms and family types are thus clearly "the products of human experience, of human habits, and are therefore to be dealt with by society according to human needs."

This social revolution began, in a sense, with the Reformation, when the temporal lawmaker emerged from the ecclesiastical tyrant. Added to this, we have, in America especially, "the veritable revolution in the condition of woman," an inescapable accompaniment of democratic progress. Professor Howard takes an optimistic view of the problems raised by the higher education of woman and her increased interest in political and intellectual affairs. The fear that "the education of woman, in connection with her growing economic independence, will prove harmful to society through her refusal of matrimony or maternity, appears groundless"; just as groundless as the old notion that woman was by nature the inferior of man and must be kept so for the sake of society. Woman is enough of mankind to have some right in determining whether marriage is her sole vocation, and her destiny merely that of a child-bearing animal. College women are no more likely to overstep the bounds of human evolution than are college men. The larger activities of "self-conscientious society" will improve woman, not destroy her. Even

in the divorce movement hide some evidences of woman's progress and her growing independence. The increase in divorces in America, as Bryce pointed out, does not necessarily signify a fatal and permanent decline in the standard of domestic morality; this can be true locally only, *e. g.*, in certain sections of the wealthy class. The laxity of marriage laws, rather than the ease with which divorces may be obtained, is the danger-spot. Here, as elsewhere, "an ounce of prevention is worth a pound of cure." Checks upon the marriage of the unfit, a loftier popular ideal of the marriage relation, the gaining of a right perspective through earnest and persistent educational effort, the according to sex questions an honorable place in the future educational programme, the realization of the sociological value of coeducation and its rôle as a producer of happy unions, the sacrifice of some arithmetic or a little more Latin for practical suggestions in home-building, the repudiation of the dual standard of sexual morality, the fostering of the larger altruism protective of "the permanent interests of the future against the more temporary values of the present," the development of individualization for the sake of socialization—these are some of the aims and ideals, reforms and improvements in law, written and unwritten, advocated by the author.

His work, based on the investigation of all accessible literature, historical, scientific, and legal, touches upon every problem involved in marriage and divorce, and its optimistic conclusions are quite in harmony with the true interpretation of evolutionary facts concerning the social development of mankind. It would be well if the extreme advocates of "divorce reform" and the Mormonophobiacs could give it careful perusal. For even the general public Professor Howard's volumes cannot fail to be both interesting and instructive, for they deal attractively with the most human of all institutions, and contain a mass of facts nowhere else obtainable. A bibliography, occupying pages 264-411 of volume iii., and a double-column subject index extending to thirty-seven pages, make this work very easy of use for reference purposes. What few misprints the reviewer has noticed, *e. g.*, in the transliteration of foreign names of tribes and peoples, are of but the slightest importance, and do not detract from a well-conceived, well-written, well-printed book. It takes its place beside Westermarck, but is *sui generis*.

Fifty Years of Fleet Street; being the Life and Recollections of Sir John R. Robinson. Compiled and edited by Frederick Moy Thomas. Macmillan. 1904. Pp. 404.

On opening this book we turned first to the chapter upon "Americans in London." It is made up of anecdotes of President Grant, of Tilden, Bigelow, Sumner, Lowell, Motley, Holmes, Conkling, Bayard, Mark Twain, Artemus Ward, and Bret Harte. We confess, the impression gained was not favorable. One sees here, what is not infrequently to be observed in our cousins, the facility with which an Englishman manages to repeat a story, first told by an American, so as to blunt the point. An example or two of this tendency, as well as the fact that half a page is given to some trifling remarks of Gen. Grant's son Fred, then not much more than a mere boy, made us expect to find the book superficial, and probably not worth the reading. A sounder judgment, however, awaited an actual examination of these pages from the beginning. The text is interesting and at times absorbing.

John Richard Robinson (1828-1893) came of a Unitarian family in Essex. He early devoted himself to newspaper work; went up to London in 1852, and three years afterward was made sub-editor of the *Weekly News*. From that he was advanced to be editor of the *Daily News*—founded by Charles Dickens—one of the great newspapers, as everybody knows, of London, and finally its manager. He was knighted in 1893 because of his journalistic efforts in behalf of public interests. He was a man of quiet manner, very observant, and accustomed to jot down in diary form his impressions of events and of people whom he had met. Once a year regularly he read through Scott's novels and Miss Austen's. The editor of this good-sized volume, a son of a friend of Sir John, and himself for years associated with the chief editor in newspaper work, here and there gives us Robinson's own words, but seems to have elaborated by far the greater part of the book.

Every book has, or ought to have, a certain tone to it. We can say of 'Fifty Years' that a vein of good nature and social enjoyment is distinctly visible throughout it. It is brimful of stories; almost every one is worth the telling. We have much about Mr. Gladstone, perhaps little of it new to English readers. Public men in general are delineated by Mr. Robinson with a light and kindly touch, and some characteristic anecdote is related of each in turn. There is a valuable chapter upon the subject of journalism, with a discussion of the question of the advantage or disadvantage of signed leaders. The difference between the newspapers of Paris and London is aptly explained. In the treatment of the war correspondent, what is said of Archibald Forbes is extremely interesting, as are the references to the Americans MacGahan and Millet. Harriet Martineau was long an editorial contributor to the *Daily News*. The chapter devoted to her is one of the best, presenting in clear outline the salient characteristics of a remarkable woman. One is tempted to quote liberally. Lord Carmarthen, when he "put up for Brixton, happened to be a very youthful-looking candidate, and a rude man called out to him at an open-air meeting, held the day before the poll: 'Does you mother know you're out?' 'No,' was the reply, 'but she will know I am *in* to-morrow'" (p. 56). Speaking of the odd way in which old-fashioned reporters used to be precise, Robinson praises their good intentions with an illustration drawn from Henry J. Byron, who was once pressed by a host for an opinion upon a particular wine they were tasting. "Ah!" said Byron, sipping it carefully and divided between his wish to avoid hurting his friend's feelings and the desire to maintain his credit as a judge, "I think it means well." There is a good deal of harmless gossip about play writers and actors. Jerrold is often mentioned, and the popularity of his "Black-Eyed Susan" remarked upon—"a crude, bombastic work of his younger days." Such is the editor's criticism; but the play found favor in America, when E. L. Davenport played *William* "in the good old days."

"It is said that on one occasion a young actor, having to play the part of the hero, was seized with stage-fright, and in the scene of the court-martial was unable to utter a word. The President of the Court, seeing how things stood, found a brilliant way out of the difficulty. 'We know, William,' he said, 'what it is you would tell us were it not that emotion checks your utterance. You would say that you heard your wife Susan giving signals of distress; you found her battling with a pirate. You cut him down like an old junk; and, had he been First Lord of the Admiralty, d—— *you*, you would have done it the same'" (p. 190).

In the chapter upon Americans in London, there are two observations which will hardly pass unchallenged on this side of the Atlantic. Speaking of Mr. Sumner's surprise, on his visit to England in 1872, at being regarded as anti-English, the writer proceeds: "They looked upon the learned Senator, rather unjustly, as the author of those celebrated 'indirect claims' which Lord Chief Justice Cockburn's brilliant pleading at Geneva had made more odious to English folk than before." Why *unjustly?* The indirect claims, by the way, had been removed from the consideration of the Tribunal by joint action of the two governments, so that Sir Alexander Cockburn was not called upon at Geneva to express any views thereon whatever, even had it been the office of a member of the court to put forth a "pleading," brilliant, or otherwise. Mr. Motley is termed a "famous American Minister . . . chiefly remembered for his splendid history, 'The Rise of the Dutch Republic,' and a rather foolish epigram about not caring who had the necessaries of life so long as he had the luxuries." It is really too bad that such a cold-blooded assertion as this should be charged against Motley. Little did Dr. Holmes dream of getting his friend into such a scrape when, by an allusion to "my friend the historian," he set going Motley's witty remark: "Give us the luxuries of life, and we will dispense with its necessaries."

The book is printed from clear, large type, and has an index of names.

Men of the Covenant. By Alexander Smellie, M. A. Fleming H. Revell Co. 1904.

The Jacobite eloquence of Mr. Lang and Mr. W. L. Mathieson's defence of Scottish episcopacy seem to have aroused in Mr. Smellie a fear lest the memory of the Covenanters should fade away amid the panegyrics which are now being heaped upon their foes. With a view to redressing the balance, he tells once more the story of Lowland and Calvinist heroism to a generation that may have forgotten the works of Dodds and Gilfillan. His general attitude toward the ecclesiastical policy of Charles II. is frankly stated in the preface:

"Some may complain that the atmosphere of these chapters is too whiggish, and that they scarcely so much as try to understand and appreciate the Cavalier. I can but plead that to me it seems evident that the Covenanter, in the main, was incontestably right; although I hope that I have never been conspicuously unfair to his opponent."

These words are an honest forecast of the contents, for while Mr. Smellie reserves his enthusiasm for the Covenanters, his strictures upon their persecutors are

penned more in sorrow than in anger. He can appreciate the firmness of Montrose and the daring of Claverhouse. It is only men like Sir Robert Grierson of Lag ("Redgauntlet") who receive his unstinted condemnation. "He had not even the superficial polish with which some of his brother Royalists bedizened their cruelties. He was as ungracious in manner as he was hard of heart, a Judge Jeffreys on a smaller scale. . . . To this hour, in Dumfries and Galloway, a paramount horror cleaves to his name."

The plan of Mr. Smellie's book is well fitted to show the Covenanters at their best, since he dismisses with a brief prologue the period which lies between the swearing of the National Covenant in 1638 and the Restoration. We do not mean to imply that Johnston of Wariston and Alexander Henderson, with their followers who rallied to the Presbyterian cause against Charles I., were destitute of conviction and heroism, but the best advocate in the world cannot make out a good case for the Covenanters in 1650-51. Mr. Smellie's candor is revealed in his unwillingness to sanction the hollow compromise that was patched up between Charles II. and the Kirk. Like every one else who is not blinded by partisanship, he can see that dislike and dread of Cromwell made the elect cut sharp corners on the eve of Worcester Fight. At the same time the feud of Resolutioners and Remonstrants is not an essential feature of his narrative. Amid the martyrdoms of 1685 the hypocrisy of a former generation is forgotten, and the Calvinist stands before us in all the robustness of an unbending will.

It is difficult to say whether the Covenanters are more interesting when considered as Scots or when considered as the disciples of Geneva. Certain it is that if the Stuart sovereigns of the seventeenth century knew little about English feeling, they knew still less about the sentiment of that realm which they had deserted for Whitehall. The indifference of the British Parliament towards Indian affairs, as satirized by Macaulay, was far less remarkable than the absolute neglect of Scottish interests which is testified to by Clarendon. "When the whole nation," he says, "was solicitous to know what passed weekly in Germany and Poland and all other parts of Europe, no man ever inquired what was doing in Scotland, nor had that kingdom a place or mention of one page of any gazette," Even Cromwell failed to grasp the force of Scottish patriotism, and regarded the sister kingdom in much the same light as that in which Metternich regarded Hungary. Had Lauderdale added a dash of honesty to his other versatile gifts, he might have kept Charles II. from committing himself to a policy of oppression. Instead, he became the local agent of a despotism which had no better wit than to drive the Lowland peasant and the Calvinist parson to the wall. When Balfour of Burleigh withstood the appeal of David Hackston for Sharp's gray hairs and slew the Archbishop on Magus Moor, he was not acting the militant saint but the irritated Scot, and we feel quite sure that Stubbs would have allowed little piety to many of the most vociferous Covenanters. Yet their advocacy of a theological cause had some psychological effect upon even the most astute of the Calvinist politicians, while the rank and file died in the faith of Knox without hesitation or misgiving. Holland had gone through the same sort of trial on a larger scale, and issued from it a century earlier. The characteristic feature of the "Killing Time" is that the resistance of the Covenanters to Charles and James represents an extremely late instance of religious zeal blended intimately with patriotic enthusiasm. In the first half of the eighteenth century this combination of elements has virtually disappeared. The influence of Catholicism upon the Jacobites is an eviscerated thing compared with the promptings which Richard Cameron and Donald Cargill received from Calvinism.

Like all successful works of edification, Mr. Smellie's story keeps close to the concrete and the particular. In fact, his chapters form a series of portraits which is large enough to take in the heroines of the Covenant as well as the heroes. Executions among women of the Cameronian persuasion were not frequent, but sometimes they occurred, and the demeanor of the victims at the moment of crucial test seems borrowed from the age of Polycarp. Marion Harvie and Isabel Alison, two servants, were executed in the Grassmarket at Edinburgh towards the close of January, 1681. Just at the end, a curate was ordered by Bishop Paterson to pray for them.

"'Marion,' said the Bishop, addressing the first of them, 'ye said you would never hear a curate; now you shall be forced to hear one'; and he commanded one of his suffragans to pray. But he was outwitted. 'Come, Isabel,' exclaimed the unconquerable serving maid, 'let us sing the Twenty-third Psalm.' Line by line she repeated the calming and uplifting words which Scottish children are taught so soon as they can lisp their syllables; and line by line these two, who were appointed to death, sang of the Lord their Shepherd, and of the Valley of the Shadow where His rod and His staff sustained them, and of God's House in which, for evermore, their dwelling-place should be. And not a petition of the curate's prayer was heard."

In a higher station Lady Balcarres and Lady Baillie showed such zeal for the Presbyterian cause that Mr. Smellie includes them also in his group of "Women which Laboured in the Gospel."

Mr. Smellie's narrative covers the twenty-eight years which separate the Restoration from the Revolution, and embraces all the celebrated cases of martyrdom. Tragedies like the murder of John Brown and the execution of James Renwick call for no special comment when they occur among the religious animosities of the sixteenth and seventeenth centuries. English Jesuits under Elizabeth showed the same courage which Mr. Smellie describes with so much unction in the case of Scottish Calvinists. As martyrs, these men illustrate some of the finest traits in human character, but to the historian Mr. Smellie's evangelical phrases seem a good deal like question-begging. However, he deals with facts which, in the main, are well-established, and every one must interpret them for himself. The same blood which is the seed of the Church is the seed of sects when the Church is rent by schism, and while we must admire the dour courage of the Covenanter, we must, before we give the whole praise to pure religion, consider two things—the admixture of racial stubbornness and the existence of a similar temper among Catholics and Anabaptists. This observation is called forth by the glowing periods of Mr. Smellie, which sometimes tend toward turgidity.

In point of style this book is unusual. Mr. Smellie is anxious to glorify his heroes, but he cannot conceal the fact that he is a man of wide reading. Accordingly literary allusions of more or less aptness are embroidered with the narrative at junctures where we should prefer to have the unvarnished story. At his best, however, Mr. Smellie writes well, and his pages bear the mark not only of genuine enthusiasm, but of honest intent.

The Early Institutional Life of Japan. By K. Asakawa, Ph.D. Tokyo, 1903.

This important essay, the author of which was Hadley scholar at Yale and is now lecturer on the Far East in Dartmouth College, professes to be merely a brief introduction to the study of feudal origins in Japan. The writer modestly says that his work is intended primarily for criticism and discussion, but he guides the Western student into practically unexplored regions of history, and it seems hardly too much to say that he has here laid the foundation-stone for the critical study of early Japanese institutions. It is a good many years since Titsingh, Siebold, and Hoffmann used to believe in the Emperor Jimmu's having ascended the throne in 660 B. C., but no English or German scholar has yet attempted, as Dr. Asakawa here attempts, to draw a comprehensive picture of Japanese institutions prior to the great Reform of 645 A. D., or to study in detail the sweeping changes that were then introduced.

Mr. Aston's well-known version of the *Nihongi* gains enormously in interest if read in the light of Dr. Asakawa's researches, just as the first book of Livy, which deals with a similar dawn-period of history, becomes far more interesting after a perusal of Sir John Seeley's historical introduction. The *Nihongi* and the older and more fabulous *Kojiki* furnish, of course, the chief data for institutional study, and the latter of these books is also fortunately accessible to Western students through Mr. Basil Chamberlain's excellent translation. Notwithstanding its astounding legends of the gods, the *Kojiki* may fairly be regarded, in Mommsen's phrase, as "historisch werthlos wie staatsrechtlich belehrend"; and so it has been here treated.

After a lucid discussion of the value of these and other subsidiary sources, the author devotes his first and longest chapter to a description of Japanese institutions as they existed about 500 A. D. Then follow two chapters, one on the events leading up to the Reform, the other, a particularly good one, on the political doctrine of the Chinese by which the Reformers were so strongly influenced. Next comes a long chapter on the new institutions introduced under Kôtoku and his successor; and lastly a short chapter sketches the subsequent development. The various topics are well arranged and the facts clearly marshalled, while the author's inferences and arguments are marked by critical caution and a commendable absence of cocksureness. For instance, in summarizing his conclusions as to the pre-Reform period, he says that they are "hardly more than a series of suppositions separated by wide gaps of thought."

Just at this time almost any fresh information relating to Japan is sure to be

read with interest. To those who would understand the devoted loyalty of the Japanese to their Emperor, of which we have heard so much during the present war, the first section of Chapter I. will be extremely enlightening. A most interesting account is there given of the origin of that sentiment, "which does not seem to have been in the least eclipsed, but, on the contrary, rather stimulated, by Japan's competition with the Western nations"; and its intimate connection with Shinto is convincingly shown.

Perhaps the most striking feature in the book to a Western student unfamiliar with early Japanese institutions is the parallelism which is constantly being suggested between the primitive customs of Japan and those of early Rome. Among these may be mentioned agnatic relationship, the vital importance of maintaining the family *sacra*, the *patria potestas*, the function of the *gens* (*uji*), and the early conception of private title to land. No less remarkable is the fact, which is here so clearly pointed out, that the Emperor (not the Mikado, a term against the use of which we are properly warned) was the prime mover in the Reform of 645, just as he was in that of 1868, and that these revolutions both aimed at a restoration of the imperial authority.

The author's style is clear for the most part, though he has neither ease nor elegance equal to that of writers like Professor Hozumi or Baron Kentaro Kaneko. It seems ungracious to criticise the English used by any foreign scholar, yet one cannot help wishing that this text had been emended by some one thoroughly familiar with correct English. We meet with such phrases as "charged to their descendants' keep for all time" (p. 29); "this inference . . . cannot be positively sure of its own validity" (p. 66); "an apparatus that ground on the peasant population" (p. 296)—all of which might have been avoided. The same is true of words such as "distemper" in the sense of anger (p. 70, note 1), and "distancing" in the sense of separating (p. 213), Though there are three pages of errata, these do not by any means cover all the misprints to be found in the text, of which "opinion" for opium (p. 184, note 1) is an amusing example. But when due allowance has been made for such blemishes, which are excusable, if anywhere, in the work of a foreigner, the author is to be congratulated on having successfully accomplished a difficult piece of pioneer work.

Apollo. Par Salomon Reinach. Paris: Hachette. 1904.

The Story of Art throughout the Ages: An Illustrated Record. By S. Reinach. From the French by Florence Simmonds. With nearly 600 illustrations. Scribners. 1904.

Under the somewhat fanciful title of 'Apollo,' chosen to mark its relationship to his introduction to the Greek and Latin classics, published in 1889 with the name of 'Minerva,' M. Salomon Reinach brings out a "General History of the Plastic Arts," as delivered in twenty-five lectures at the École du Louvre in the winter of 1902-'3. The first of the lectures opens with the question: "Is it possible to give, in twenty-five lessons, an idea of the evolution of the plastic arts—that is, of the arts the productions of which are representable by drawing—architecture, sculpture, painting?" The answer must be, Yes, when the teacher is Salomon Reinach. M. Reinach's exceptional equipment has enabled him to pack into his three hundred-odd pages a general history of art which not only is admirable in its broad views, but is full of acumen in the treatment of doubtful points of detail, and of illuminating and delightful criticism of particular artists, while the style is as fascinating as that of a novel should be, but seldom is. The book is a little masterpiece, and one does not wonder that it was difficult to find room for the audiences that flocked to hear the lectures when orally delivered.

Of course, the latest results of criticism, of connoisseurship, and of archæology are at M. Reinach's fingers' ends, and he is generally at one with the best and most recent authorities, though he does not hesitate now and then to differ from others, and to give, with due warning, opinions of his own, as when, *e. g.*, he dates the Venus of Milo some three hundred years earlier than do "the majority of the archæologists of to-day," and considers her a work of the school of Phidias, and an Amphitrite. His taste and judgment are as sure as his knowledge is exact, and it requires a certain boldness to question either the adequacy of his appreciations or the accuracy of his statements. Perhaps, without too great temerity, one may venture to find his account of Millet insufficient rather than wrong, and to wonder that he could discuss Donatello without mentioning the "Gattamelata," and could find Verrocchio's "Colleoni" unquestionably "the most beautiful equestrian figure of the Renaissance." The only statement of fact that strikes us as incautious is in the discussion, on page 165, of the relation of Antonello da Messina to the use, in Italy, of oil colors. M. Reinach says:

"It is well to say that oil colors were employed at this epoch only to give a superficial lustre to a very solid painting executed in distemper (glue or white of egg), which formed the basis of the picture. The first painter who painted directly and exclusively in oils was the Spaniard Velasquez."

M. Reinach may well be right as to the Italian schools, which he evidently had principally in mind, but it would seem that he must, temporarily, have forgotten Hals and Rubens, both of whom antedate Velasquez, and neither of whom shows in his work any trace of the underpainting in distemper.

The book is profusely illustrated with very small but clear half-tone cuts, and each lecture is supplied with a valuable bibliography. It is assuredly the best brief general history of art, if not the best such history of any length, that has yet appeared. It deserved a better and more faithful translation than has been given it by Florence Simmonds. Her version is readable enough, and succeeds, generally, in approximating to the meaning of the original, but it is lax and without appreciation of the finer shades of the French, and is occasionally not only infelicitous, but misleading. To say that Leonardo's method of painting was a "complicated amalgam" does not express the idea conveyed by M. Reinach's "cuisine compliquée," while to speak of Raphael's "loans" where borrowings is intended is to reverse the meaning. "Un jour d'atelier" means simply a studio light, and has nothing to do with "the sunlight of the studio," whatever that may be; and "moins pondéré et plus agressif" is singularly transformed into "less ponderous and aggressive." When M. Reinach says of Fra Bartolommeo that he "knew how to compose and to paint," he is speaking of his influence on Raphael, and has a reason for the words he uses which one would never divine in Miss Simmonds's statement that the Frate "was a remarkable colorist." The fault here is probably indolence, but in another instance one suspects intention. M. Reinach says that Millais early abandoned the principles of Preraphaelitism and became "un bon peintre bourgeois"; Miss Simmonds boldly makes him "a first-rate painter on traditional lines"—certainly a less piquant characterization.

The reason why we suspect intentional mistranslation in this last instance is that the French text is more or less altered and very considerably added to wherever English art is under discussion. The additions vary from the insertion of the single word "beautiful" in the mention of the Banqueting-hall at Whitehall to passages nearly a page in length concerning the English painters of the eighteenth century and the painters and sculptors of contemporary England. Of the alterations we will give one specimen, contrasting what M. Reinach says of English Gothic with what Miss Simmonds makes him say. This, as literally as we can translate it, is the original statement:

"In England it [Gothic architecture] took on an aspect peculiar to that country, characterized by a relative heaviness, and, later, by an unpleasant profusion of vertical lines, particularly in the window openings."

Under Miss Simmonds's hands this becomes the following:

"In England it assumed a national character, the main features of which were a greater structural sobriety and care for solidity, combined later with more richness and beauty in the ribbing of vaults and in ornament generally, and a tendency to rely upon length for sublimity of effect, rather than upon height, as did the French architects. It has, however, been made a reproach to the English Gothic artists that they made an excessive use of vertical lines, especially in their windows."

There are other small divergences from the French text, as, for instance, the appearance of Ostade in a comparison with Meissonier, where the French gives Vermeer (a much happier choice); and in these one can suspect no intention. As they occur in the last chapter, which M. Reinach tells us has been several times rewritten, and as a separate note for insertion shows that the translation was made before the final revision of the original, they may well represent an earlier state of the text. The additions and alterations we have commented on, however, are the less susceptible of such explanation in that they are accompanied by extra-illustrations taken from other books. They may, nevertheless, have M. Reinach's authorization, as they may, conceivably, be considered improvements; but, if they are authorized, some statement to that effect should surely be made. If they are not, there is still more need of explanation. As it is, one is never certain whether he is getting the opinions of M. Reinach or those of Miss Simmonds.

Apart from intentional additions, the less compact style of Miss Simmonds must add

somewhat to the length of the volume, but by using double columns and smaller type the Scribners have got the matter into somewhat fewer pages than the French publishers found necessary. The double column was perhaps adopted on account of the many small illustrations which less frequently cut the letterpress into awkward shapes than when the lines run across the page, but the device is never pleasant in a small book, and only tolerable in the larger page of a magazine. In spite of its fewer pages, the American book is larger and thicker than the French one and very much heavier. The cuts vary a little in quality in the two editions, but without special advantage to either. M. Reinach's charming preface and the opening paragraph of his first chapter are, for some reason, omitted, and there is no translator's preface and no indication on the title-page that the book is made up of lectures, though why the fact should be suppressed it is difficult to imagine.

Work and Wages. By Sydney J. Chapman. With an introduction by Lord Brassey. Longmans, Green & Co. 1904.

This book is a continuation of Lord Brassey's 'Work and Wages,' and 'Foreign Work and English Wages,' published respectively in 1872 and 1879; Professor Chapman here brings the inquiry down to the present date. It relates in general to the industrial efficiencies of the leading countries, and in particular to the coal trade, the iron and steel industries, shipbuilding, machinery, textile and chemical industries, and railways. The presentation of facts is admirably done, considering the moderate space that it occupies, and the deductions are made with scientific precision. In fact, the work may be regarded as an example of the methods proper to be followed in such investigations.

Professor Chapman wisely begins by exposing some prevalent fallacies. It seems to be commonly believed that the welfare of a country may be measured by the volume of its external trade. The notion is equally common that a country is "beaten" by its foreign rivals in respect of efficiency in the production of such goods as it buys abroad. But it is an elementary proposition that exchange is regulated by differences in comparative cost of production. Differences in comparative prices may start trade, but they cannot keep it going. In one country the cost of production of two things may be less than in another; but it does not follow that both will be exported. It may pay better—it often does pay better—to export one and import the other. The illustrations of this truth form one of the most interesting departments of economic science, and to ignore them is to fail to understand the nature of commerce. On similar principles, it is evident that a particular country might be prosperous without any foreign trade whatever, although the case could not occur under modern systems of transportation.

As Dr. Cannan observed not long ago, many fallacies are caused by the application of military metaphors to foreign trade. "In regard to international relations, the first business of the teacher of economic theory is to tear to pieces and trample upon the misleading military metaphors which have been applied by sciolists to the peaceful exchange of commodities." When we speak of "conquering markets," we mean that we sell in them. It is obvious, as Professor Chapman says, that such a victory means that the victors must be conquered in the same way. In war a nation might only win, but in trade a country cannot only sell. "Commercial supremacy" is a common phrase, but those who use it do not define it or know what it means. But if it means large exports, it must mean large imports as well. Estimates of the money cost of production in different countries are of no value in determining efficiency in production, or as indicating which countries can undersell others. But such estimates are of value when we know something of the natural resources, the efficiency of laborers and managers, the facilities for transportation, etc., in different countries. To impart such knowledge is the aim of this inquiry.

It is impossible for us to review, except in the most general way, the results which Professor Chapman attains. We must content ourselves with enumerating some of the conditions to be investigated in determining the comparative efficiency of two countries in one branch of industry—the iron and steel trade. We must know the amount of work to be done in assembling materials at the furnace, the rates on railways, canals, the lakes and the ocean, the cost of smelting and of producing steel, the supplies of coal and ore and their cost, and the cost of producing coke. We must also estimate the burden of taxes and tariffs, the cost of capital and the cost of labor. We must understand the conditions under which money wages are expended, the cost of house rent, of food, and the quantities and qualities of the commodities which laborers consume. When we consider that industrial efficiency is a function of all these variables, it is evident that very little of what is laid before the public on this subject is of any value at all. The mass of mankind is no more competent to grasp such an inquiry than to compute the precession of the equinoxes or the period of a comet. To most minds any scientific investigation is so laborious as to be repellent, and we cannot recommend Professor Chapman's book to the ordinary reader. But such as are really interested in the quest for truth will find it thoroughly informing and delightful.

Russian Life and Society. As seen in 1866-'67 by Appleton and Longfellow, two young travellers from the United States of America, who had been officers in the Union Army. And a journey to Russia with General Banks in 1869. Prepared by Brevet-Captain Nathan Appleton. Boston: Wood & Co. 1904.

The title of this little book is a misnomer, to a great extent. "My Recollections" would have been both more appropriate and more accurate. It begins with a description of the voyage to Brest, and of a stay in Paris; the narrative of the journey thence (with various stops) is interspersed with letters to and from relatives, including complete details—dates, and the like—concerning Mr. Thomas G. Appleton's yacht. Then follows a jumble of poetry, a biography of Gen. de Trobriand, and much discourse about Mme. Ristori, the New York Yacht Club, other clubs, beach races at Newport, Lincoln, and the Emancipation (with the Emancipation Proclamation in full, likewise the Constitutional Amendments, and personal recollections of President Lincoln, whom Captain Appleton never met—all apropos of a portrait of Lincoln by W. M. Hunt, and the failure to find Hunt in Paris). At last, on page 72, the two young men arrive in Russia. During their two months' stay they enjoyed many privileges, and their mild experiences are pleasantly narrated, chiefly in letters. But they are hardly important at the present day. Indeed, the tone of the book is that of a memorial prepared for admiring friends, and padded out to the requisite bulk with precise biographies of every person whom the author ever met or to whom he refers. For example, from an entry in his diary at the age of seventeen, he finds that he met, at a reception, a Mr. Smith. He tells at what hotel Mr. Smith was stopping, and winds up thus: "He won my heart and esteem at once. I was devoted to him. One day we strolled down Broadway, and he treated me to oysters and a glass of beer, and I thought I was a man of the world." (This, with many other irrelevant matters, including poetry about Allston's picture known as "Rosalie," and letters from the writer's brother, dated 1844, is injected into the middle of his Russian experiences.) Just as the reader has given up in despair all hope of finding anything about Russia, he is soothed with a fragment, and then the irritating process above described begins again. Captain Appleton persists in calling the Russian hood, the *bashlyk*, the "basilisk," and writes "morijiks" for "muzhiks," while other errors (probably typographical) result in curious names being applied in various directions.

Captain Appleton went again to Russia, in 1869, accompanying General Banks, spending about one month and again enjoying favorable opportunities, on his way to the opening of the Suez Canal. For good measure, he throws in a summary concerning the territory of Russia, the system of government, the serfs, and other miscellany, plus a sketch written in London in 1870, in which he treats of "Europe and America in 1870. . . Russia and the United States."

The illustrations are as badly assorted as the contents, and not well reproduced. Stripped of extraneous and utterly superfluous matter, the title-material might have furnished a successful magazine article of the travel class.

The Georgics of Virgil. Translated from the Latin into English by J. W. Mackail, Fellow of Balliol College, Oxford. Boston: Houghton, Mifflin & Co. 1904.

One hardly knows whether a narrowly limited *édition de luxe* of the Georgics, at $7.50 per copy, is intended to appeal to the classical scholarship of America or to our professional collectors, who are not generally supposed to care much as to the literary content provided the material elements of the volume be satisfactory—the edition rare enough and the price high enough. The classical scholar would appreciate more keenly, we think, an edition of the Georgics so attractively prepared as to tempt the college graduate to an actual acquaintance with its contents, and at so reasonable a price as to constitute no ser-

ious burden upon his purse. Such an edition should comprise an adequate introduction, and sufficient annotation to make its reading fairly easy. It should, of course, be free of all suggestion of the grind of the preparatory school, for the fame of Virgil suffers a serious handicap in the fact that the American college student gets his only taste of his work at a stage when the struggle with forms, syntax and vocabulary forbids any adequate appreciation of the poet's literary qualities. It is not particularly to the credit of our classicists that scarcely a single piece of Latin or Greek literature has been put by American hands in such dress that an educated gentleman can feel like giving it a place upon his library table, dipping into it occasionally as a means of recreation, and bringing it to the attention of visiting friends. The means of acquiring an elementary knowledge of Latin and Greek we produce in abundance; that attitude towards the literature of these tongues which would tempt to the use of such means for any higher and more lasting purpose than the securing of a degree, is sadly wanting.

We welcome Mr. Mackail's edition, then, if for nothing more than its mere suggestion to the few of our classical scholars who will see it, that there is some other possible use for a portion of Virgil's text than to serve as an aid in getting boys and girls past their college entrance examinations. Those who really care for the Georgics would have appreciated a little of the illuminating comment which Mr. Mackail is so well able to give, but doubtless the simple translation was all that his own purpose and that of his publishers required. Agreement as to what such a translation should be is, of course, impossible. Our own opinion is, that the conscious attempt to give an archaic air to the translation of a writer like Virgil may easily be overdone. "What plantations soever thou wilt set over thy fields, scatter fatting dung, and hide it heedfully deep in earth," is not English of to-day (if of any other day), nor does it bear to the English of to-day any such relation as the original text bore to the ordinary Latin of the early years of the Empire. We find, however, extended passages of very felicitous rendering. Take the following, for instance, descriptive of the coming of spring:

"The bountiful land breaks into birth, and the fields unbosom to warm breezes of the West; everywhere delicate moisture overflows, and the grasses dare in safety to trust themselves to Spring suns, nor does the vine tendril fear gathering gales or sleet driven down the sky by the blustering North, but thrusts forth her buds and uncurls all her leaves."

That in choice of materials and mechanical execution the volume is fully up to the standard of the Riverside Press is all that needs to be said in that respect. One could easily recall other bits of Latin literature well worth similar honor, but, we repeat, there is greater need that these works be presented to possible American readers in tasteful and attractive dress, and yet at prices which will stimulate their purchase for actual use rather than for the cases of collectors.

A noteworthy novel
By the author of "Cecil Dreeme"

Mr. Waddy's Return

by THEODORE WINTHROP

Edited by **Burton E. Stevenson.** $1.50.

Nation: "In these pages is found again **the old charm of Winthrop the writer** . . . a gay, fun-loving, crisp manner, a sound, sensible romanticism, a natural fineness, a quaint floweriness, with an occasional flash of the youthfully lurid."

IMPORTANT NEW MACMILLAN BOOKS

JUST READY

The Cambridge Modern History

Volume III. The Wars of Religion

is the new addition to "the most full, comprehensive, and scientific history of modern times in the English language, or in any other language" (*Nation*). Aside from it, the volumes now ready are—

Vol. I. THE RENAISSANCE

"The best short monographs in English on their respective subjects."—*New York Times' Saturday Review.*

Vol. II. THE REFORMATION

"It is a fascinating volume for the student, or for the general reader who loves to inquire into the great movements that have shaped the destinies of the race."—*Brooklyn Eagle.*

Vol. VII. THE UNITED STATES

"All things considered, no single volume of its size affords so good a history of the United States as this."—*American Historical Review.*

Vol. VIII. THE FRENCH REVOLUTION

"In some respects the most satisfying of the volumes so far published . . . and there is no work which is so comprehensive and at the same time so compact and so just withal as this."—*The Evening Post*, Chicago.

To be complete in twelve volumes. Royal 8vo. Each volume $4.00 net. (Carriage 30c.)

Eden Phillpotts' *new novel* **The Secret Woman**

By the author of "The American Prisoner," "Children of the Mist," etc. *Cloth, $1.50*

"Mr. Phillpotts has produced his masterpiece in this novel."—*The New York Herald.*

BY THE SAME AUTHOR **The American Prisoner**

"A novel by EDEN PHILLPOTTS must be reckoned one of the literary events of the season."—*Evening Post, N. Y.*

Illustrated, cloth, 12mo, $1.50 net

English Men of Letters Series *Edited by* **JOHN MORLEY.** *New Volumes.*

ROSSETTI. By ARTHUR CHRISTOPHER BENSON. *Recently issued.*

"One of the most interesting of the new series, which . . . has kept a remarkably high level of excellence."—*Evening Post.*

THOMAS MOORE. By STEPHEN GWYNN, author of "Masters of English Literature," etc. *Just ready.*

SYDNEY SMITH. By GEORGE W. E. RUSSELL, author of "Collections and Recollections," etc. *Ready next week.*

Each, in blue cloth, 12mo, gilt tops, 75 cents net. (Postage 9c.)

Historic Highways of America

By ARCHER BUTLER HULBERT

A series of monographs on the History of America as portrayed in the evolution of its highways of War, Commerce, and Social Expansion.

Comprising the following volumes:

Paths of the Mound-Building Indians and Great Game Animals.
Indian Thoroughfares.
Washington's Road: The First Chapter of the Old French War.
Braddock's Road.
The Old Glade (Forbes's) Road.
Boone's Wilderness Road.
Portage Paths: The Keys of the Continent.
Military Roads of the Mississippi Basin.
Waterways of Westward Expansion.
The Cumberland Road.
Pioneer Roads of America, two volumes.
The Great American Canals, two volumes.
The Future of Road-Making in America.
Index.

In sixteen volumes, crown 8vo, cloth, uncut, gilt tops. A limited edition only printed direct from type and the type distributed. Each volume handsomely printed in large type on Dickinson's handmade paper, and illustrated with maps, plates and facsimiles.

Price for the set, $39.00.

"As in the prior volumes, the general effect is that of a most entertaining series. The charm of the style is evident."—*American Historical Review*

"His style is graphic and effective . . . an invaluable contribution to the makings of American History."—*New York Evening Post.*

"Should fill an important and hitherto unoccupied place in American historical literature."—*The Dial.*

Full descriptive circular mailed on application

THE ARTHUR H. CLARK COMPANY
Publishers, Cleveland, Ohio

Early Western Travels

1748-1846

A SERIES OF ANNOTATED REPRINTS of some of the best and rarest contemporary volumes of travel, descriptive of the Aborigines and Social and Economic Conditions in the Middle and Far West, during the Period of Early American Settlement.

Edited with Historical, Geographical, Ethnological, and Bibliographical Notes, and Introductions and Index, by

REUBEN GOLD THWAITES, LL.D.

With facsimiles of the original title-pages, maps, portraits, views, etc. Each volume, large 8vo, cloth, uncut, gilt tops. Price $4.00 net per volume (except the Atlas, which is $15.00 net). The edition is limited to 750 complete sets, each numbered and signed; but in addition thereto, a limited number of the volumes will be sold separately.

An Elaborate Analytical Index to the Whole

Almost all of the rare originals are without indexes. In the present reprint series, this immense mass of historical data will be made accessible through one exhaustive analytical index, to occupy the concluding volume.

"A stately series of reprints—typographically very open and handsome."—*New York Evening Post.*

"Of the editing itself one needs but to say that it is done by Dr. Thwaites, whose work with the 'Jesuit Relations,' the 'Wisconsin Historical Collections,' etc., has left him without a peer in the breadth of his scholarship and the vastness of his contributions. The editor's annotations make the present series worth possessing, even if one already owns the originals."
—*The Independent.*

Full descriptive circular and contents of the volumes mailed on application.

Keller's Bilder aus der Deutschen Litteratur

Revised Edition, $1.00

IN the present edition of this popular book there have been added 134 pages, which contain longer selections from the principal German authors, rendering the work as much a book for reading as for study. Many other noteworthy changes have also been made. The author gives, in twenty-one chapters, a survey of the German language and literature during the most important epochs, singling out for detailed study the chief works of each period and writer. Each of the works is briefly summarized and in nearly every instance illustrated by typical questions. The vocabulary and style of the book are suited for younger students, as well as for those who are more advanced.

"A GREAT AMERICAN NOVEL"

THE ISSUE By **GEORGE MORGAN**
Illustrated. At all Booksellers.

Messrs. McClure, Phillips & Company

ANNOUNCE THE COMPLETION OF THE EDITION OF THE COMPLETE WORKS OF

WILLIAM HAZLITT

that they have been publishing in conjunction with Messrs. Dent and Company of London. The work has been under the editorial supervision of Arnold Glover and A. R. Waller, and it may be confidently asserted that the edition, the first ever attempted of the writings of one of the greatest of English critics, is, with the exception of the Life of Napoleon, a work long since out of date, absolutely complete.

The late W. E. Henley contributes an Introduction.

Twelve vols. Cloth, 8vo, with portraits. Sold only in sets. Net, $36.00.

NOTE.—The American Edition is strictly limited to 350 sets, of which but a few remain, and orders should be placed now to insure delivery. Orders will be filled in the order of their receipt.

IDA M. TARBELL'S

History of the

Standard Oil Company

"That her presentation should be in substance an indictment was only natural. She has arrayed her facts, however, with perfect fairness and honesty, and defenders of the company will have to meet them with like weapons. Her book is an important contribution to the history of the trusts and a very readable and extremely interesting account of a stage in American development that is of very great moment." *N. Y. Sun.*

Cloth, 8vo. Two vols. Fully illustrated. Postpaid, $5.30; net $5.00.

Professor

HUGO MUNSTERBERG'S

The Americans

"No thoughtful American can read this extremely interesting book without feeling that a very keen observation has been applied to his national life, and . . . that he understands more definitely the qualities which make him what he is and the impression which he produces." *Hartford Courant.*

"Analyzes American traits with rare acumen and urbanity." *Pittsburg Gazette.*

The Nation.

NEW YORK, THURSDAY, JANUARY 26, 1905.

The Week.

Whether the great industrial strike in St. Petersburg which was the prelude to the present upheaval in Russia, bore any immediate relation to the zemstvo agitation set in motion by the Czar himself, cannot now be determined. The sympathetic strikes since Sunday in other cities are apparently not attributable to such concert as marked the Milan general strike a few weeks ago, which was what may be denominated a rude form of plébiscite. Once started, however, in the capital, and expanding perforce beyond its original limits in the Government works, the strike was bound to take on a political aspect and to be used by patriots and factionists of every degree. The demonstration headed by Father Gopon which demanded an audience of the Czar in person, unarmed though it was, and attended imprudently if with a naïve national confidence in the Little Father by women and children, had a potential danger for the Czar's life and the stability of the Government which it would be unjust to deny. Americans, at least, ought to remember the apprehensions caused by the advance of Coxie's ragged "army" on Washington.

The fact that in Russia, historically, reform has come from above (as we were witnessing afresh up to Sunday), justified the people in a direct appeal to their benevolent despot. But the bloodshed of Sunday must also be judged historically—that is, with reference to preceding events, the dread caused by the avidity with which reform had been taken up and given wider scope, the dread of the newly bestowed freedom of speech and press, the palpable consequences of even peaceful industrial disturbances and popular unrest to the prosecution of the war. These considerations do not make the military suppression of the advance of Father Gopon's following any less lamentable, but they should serve to keep us from calling it wanton, and they should intensify our pity that the sovereign who has done more for the world's peace than any living ruler, by laying the foundation of international arbitration, and who has committed himself to Russian reform in Russian ways, should *ex officio* be held responsible for police excesses in his capital as he is for the war in the East. We are aware that objection will be made to the term "police," but only by those who regard the situation as ordinary, in piping times of peace. A government at war, with every energy strained to maintain its armaments and its military activity at a distance of thousands of miles, cannot be expected to take chances with the mob at the very seat of authority and depot of munitions. St. Petersburg, as we go to press, has not yet been declared in a state of siege, but the policing of the city was inevitably military rather than civil the moment the strike reduced the population to idleness and furnished the tinder for a revolutionary conflagration. Would any other government have acted differently in similar circumstances? Would any other government have failed to claim to be the judge of the danger?

Mr. Hay's circular note to the Powers has elicited the most satisfactory assurances that, whatever the event of the war, no further partition of China is intended. The Secretary already has a notable collection of self-denying ordinances; in fact, he held Russian paper expressing a profound respect for the Chinese overlordship at the time when the Russian companies were taking possession of northwestern Korea. He is, then, under no illusions as to the nature of such promises. On the other hand, no one should take too cynical a view of these negotiations. Mr. Hay's round-robins are something more than the elegant recreations of a diplomat; the existence of formal promises does make any resumption of old-style land-grabbing invidious, and to that extent more difficult. To have Germany, Russia, and Japan solemnly bound, does afford a kind of moral leverage for the more disinterested Powers. No state paper is of much avail when paramount commercial or military considerations cross its tenor; but in the rather delicate balance likely for some time to prevail in the Far East, the archives of our State Department do constitute a valuable makeweight for justice.

If San Domingo has "freely invited" the United States to administer its finances, there would be no aggression in our undertaking the job, though there might be folly. The matter will, we take it for granted, come before the Senate in the form of a treaty. Perhaps Senators may be a little more reluctant than the President to undertake the receivership of bankrupt republics. It is distinctly admitted by the State Department that it has been driven into this affair by the urgings of foreign governments. "The Government of the United States, having been explicitly, repeatedly, and emphatically informed by more than one of the great Powers that it ought either to try to evolve some order out of the financial chaos in the Dominican Republic, or assent to certain European creditors of that republic doing this," has regretfully decided to go ahead. That is, we are pulling the chestnuts of foreign creditors out of the fire. European nations will view with vast satisfaction this success of their plans to force the United States to face the consequences of one of the "corollaries" of the Monroe Doctrine. They see us becoming a useful agent to collect their debts. And we suspect they will indulge in much private chuckling at our light-hearted sallying forth to make the American republics "just." Distance will lend a certain enchantment to the view of justice in Puerto Plata or Carácas or Bogotá.

The Venezue'a business will bear the closest watching. It is all adrip with asphalt, and soon may be with scandal. Why does not the State Department make public the reason which led the Venezuela Government to proceed against the Bermudez Company? Our understanding is that this American corporation was caught red-handed in an attempt to overthrow the Government. Was it not the case that President Castro had documentary proof that a revolution was financed by this foreign company doing business under the laws of Venezuela? If so, it is not strange that the courts of that country should have applied the rigor of the law to the plotters. Of course, it is very easy for an American Attorney-General in Washington to affirm that the highest judicial tribunals of Venezuela are either incompetent or corrupt; but we have only to imagine what would be thought in this country of an intervention by Germany on the ground that our courts did not know their business, or else had been bribed, in punishing a German corporation for conspiring against President Roosevelt! It is clearly a case for full and deliberate inquiry and the frankest publicity. If the Big Stick is to be swung over the head of the republic in whose behalf we were going to fight Great Britain ten years ago, we are at least entitled to know the reason why.

Secretary Hay's report on the naturalization of aliens, laid before Congress by the President, is probably the most important, as it is certainly the most exhaustive, official contribution to the subject made in recent years. It constitutes an impressive plea for legislation to remedy conditions which are constantly getting worse. Unfortunately, the vital question of admitting aliens to the rights of our citizens is one which, from the very beginning, has been affected by passing political considerations. When the first law on the subject was passed in 1790, the United

States desired citizens, and made it easy for immigrants to become naturalized; but, eight years later, in 1798, the Federalists being in control and harassed by an opposition press which was in the hands of unscrupulous politicians of alien birth, a law was passed requiring fourteen years' residence in the United States before naturalization. When Jefferson's party triumphed, this act was swept aside and the law of 1802 was passed, requiring only five years' residence before naturalization, and doing away with the requirement that returns of all naturalizations be made to the Secretary of State. This act, one hundred and three years old, remains to the present day the main source from which our system of naturalization springs. Secretary Hay's recommendation that the provision of the act of 1798 requiring returns of naturalization to the general Government be now restored, stretches no Constitutional provision, for there is an express grant to Congress of power to provide a uniform rule of naturalization.

The lack of uniformity in naturalization is emphasized by the fact that, while in most States there are no laws other than the Federal statutes governing the subject, some States have supplemental laws intended to make naturalization more difficult. The result is that in those States it is (or ought to be, theoretically) easier for an alien to secure naturalization before a Federal court than a State court, while in other States the reverse is the fact. An important point brought out by Secretary Hay is that naturalization certificates differ so widely from one another in form, wording, and appearance, that the authorities of foreign Governments are not able to recognize them, and they often contain so meagre a recital that until they have been supported by additional testimony it is uncertain whether the holders come within the benefits of our naturalization treaties. It is a reasonable plea that this evil be corrected by requiring uniformity of phrasing and appearance in the certificates, and that they be printed upon a particular kind of paper, so that it will be difficult to counterfeit them.

The amicable ending of the Watchorn episode at least brings out very neatly the workings of the Senatorial mind. When the President selected a former Pennsylvanian for the Immigration Commissionership at Ellis Island without consulting the Pennsylvania Senators, Mr. Knox was as prompt to resent the slight as if he had been steeped in Senatorial dignity for five terms. The position to which Mr. Watchorn had been appointed was not in Pennsylvania, to be sure, but he had long lived at Pittsburgh, and had even been private secretary to a Democratic Governor. Ten days ago Mr. Knox was reported to be greatly stirred up about the whole matter. Confirmation had been held up in the Senate until he and Mr. Penrose could look into the matter. On Friday all objections were withdrawn. Why? Not because it had been learned that Mr. Watchorn was a model official and a man of parts, but because he had resided in two States, and in this instance had been apportioned to New York with the assent of Senators Platt and Depew. He was to perform his duties in New York in either case. The constituents of Platt and Depew were the only persons likely to be affected by his good or bad administration. Yet if "Pa." were to appear after his name in the official register, the Keystone State Senators claimed the absolute right to reject him, while if "N. Y." adorns the same page, it matters not the least what they know or think about him. The courtesies and prerogatives of the most dignified body on earth are sometimes of unearthly grandeur.

Whether an influential bystander may be charged with "meddling" in a contest when he congratulates one of the competitors before he has actually won, is a delicate question. President Roosevelt's only fault when he prematurely greeted Mr. Niedringhaus as the first Republican Senator from Missouri since reconstruction days, was in assuming that the Republican caucus vote would be binding. Had events followed their normal course, he would have been taking no more risk than the thousands of people did who sent their good wishes to the White House on November 9, though no President was legally elected until January 9. The charges which have served as a pretext for the Kerens men to bolt from the caucus nominee must have been made, and the investigation instituted, while the President's letter of congratulation was still on the way. Why Mr. Niedringhaus should have supposed that the publication of the letter would strengthen his chances is hard to see. Certainly, it contains not the hint of a personal compliment. For having been born in Missouri and for being the son of a German and a Congressman, he cannot be said, except on the "Pinafore" theory, to be entitled to credit personally. But the other side is evidently trying to make people believe that there is an effort at dictation in all of this. So does a pleasant word from Washington get translated into a potent "Hail to thee, thane of Glamis."

Although no President has ever been elected from the Senate, Gov. La Follette of Wisconsin will take his chances and enter that body. He brings to his new duties undoubtedly great forensic ability, a singularly magnetic personality, and a Congressional experience which included service on the Ways and Means Committee during the framing of the McKinley bill. But the association of Spooner and La Follette as colleagues within a year after the open split in the party is a situation which future events might easily make either comic or tragic. It is rare enough, in the first place, for any State to have two Senators who possess the capacity for leadership. And when the two, as in the present case, represent opposite ideals and policies, the inevitable friction is likely to impair the usefulness of both. Questions of patronage are sure to force themselves to the front.

The reduced and almost vanished majority for the articles of impeachment in the Swayne case was in striking contrast with the practical unanimity with which impeachment proceedings were voted a month ago. And the change is not due merely to partisanship rallying to the aid of a Republican judge under fire; it represents an honest doubt about the charges, many of which under debate have turned out to be of the flimsiest sort. Indeed, the whole incident illustrates the value of full and free debate in the House, as compared with the machine-like procedure by means of which bills are generally ground out into laws. Evidently, to have sent the Swayne charges on with a perfunctory approval would have worked a real injustice. The time necessary to thresh the matter out was by no means wasted; it has, reversing the late Mr. Reed's epigram, demonstrated that the House may usefully be a deliberative body. It is eminently a lesson to lay to heart as the important railway-regulation bills, most of them extremely inchoate in form, are pending. They should be not merely strangled in committee or precipitated upon an unprepared House, but thoroughly debated. Only in such fashion are we likely to get near the truth of a very difficult and complicated matter.

Speaker Cannon quietly revealed last week the game of delay, by playing which the President's Republican opponents hope to defeat his plans for tariff revision. In a speech before the Washington Board of Trade, the Speaker said that business must not be "disurbed" by any talk of tariff changes at present. Next December, urged your simple-minded "Uncle Joe," will be time enough to take up the whole question with deliberation. Thus we see that, having induced Mr. Roosevelt to abandon his valiant intention of summoning Congress in March or April, the next move is to make him give up calling it in September or October. But the President can scarcely fail to see the snare. Once pushed over to the regular session, all the old political arguments

will be worked hard in favor of doing nothing whatever about the tariff. The Congressional elections will be impending; plans for nominating a President in 1908 will be afoot; and it would never do to say "tariff" above a whisper. We know that dreary old round. So must President Roosevelt. And unless he wishes to see himself tricked, betrayed, and thwarted, he will press with all his authority for an early consideration. Meanwhile, he should leave off talking about tariff revision as a mere question of "political expediency." What really gives edge to the demand that the tariff be revised, is the general and growing sense that gross favoritism and rank injustice go with the existing law.

If only because the Fall River strike was the greatest ever known in the textile industry of this country, its settlement last week is of high importance. What the return to work means to the operatives, may be inferred from their demonstrations of joy. Thousands of them have been brought to the verge of starvation; and, as they go back to the mills at the 12½ per cent. reduction in wages against which they struck on July 25, 1904, it must be clear to them now that the strike was a mistake from the beginning. The loss in wages alone has been about $3,000,000, and there is now only the promise of a slight increase in the rate up to April 1, provided that an independent examination of the manufacturers' books shows that they can afford to pay it. Gov. Douglas deserves praise for having brought his business knowledge and good relations with the employees so happily to bear. To the mill-owners, also, credit is due for having consented to an expert examination of their business, so as to prove to the public that they have paid as high wages as possible. This is a kind of voluntary publicity wholly admirable.

Gov. Stokes of New Jersey informed the State Legislature in his inaugural, last week, that the news wafted from Washington on every breeze may mean the "preliminary steps" to the passage of a national incorporation law. He reminded the State that it can continue to meet its expenses without levying direct taxes only on condition that the Secretary of State continues to do a flourishing business at the old stand in corporation charters. But he cannot if capital is invited to seek incorporation, upon favorable terms, under Federal laws. Having called attention to the possible dangers that threaten the revenue system of the State, the Governor passed on to consider ways and means by which the impending peril might be averted. "Business methods," he says, "progress and modernize," and laws must keep pace with changing conditions. New Jersey, in the face of increasing competition from other States, would do well to consider whether she should not make her appeal to the confidence of the honest investor rather than the favor of the get-rich-quick concern. "If our enactments fail," remarks Gov. Stokes, "to give either the public or the investor sufficient protection, let us make them sufficient."

One could wish that this exhortation had not been delayed until a prospective loss of revenue had furnished the preacher with an appropriate text, but Gov. Stokes is entitled to the credit of having made the most of his first opportunity. He recommends that a commission be appointed to study the corporation laws of the State, and to devise some plan by which New Jersey may lead the way in enlightening public sentiment upon the subject. We are not oversanguine that Saul will immediately take a high place among the prophets of the new dispensation of public control of business corporations; but, whatever the immediate fate of his proposal, Gov. Stokes will not lack other opportunities of improving the policy of his State. In recent years the ugliest feature of the situation has been the readinss of the New Jersey Legislature to tinker with the statutes whenever sufficient pressure has been brought to bear. The courts of the State have been inclined to hold corporation directors strictly accountable for all infractions of the few salutary restraints in the existing laws; but, whenever respectable financiers have unexpectedly found themselves caught in the toils, the Legislature has been willing to rush to their relief and grant full absolution and future immunity. Performances of this sort have been rapidly reducing to a pitiable farce the little protection which the law has professed to offer minority stockholders and the public.

Mayor McClellan has taken an admirable stand upon the question of water supply for this city. As he explained to the Manufacturers' Association on Thursday evening, although a strong partisan himself, he has come to realize that the water question confronting Greater New York is so difficult and so serious a problem as to necessitate its being taken wholly out of politics. Therefore, he has had introduced into the Legislature a bill to turn the whole question over to permanent commissioners—one to be appointed by the Mayor, one to be nominated by the Chamber of Commerce, and one from a list made up by the American Society of Civil Engineers. When one considers the long line of scandals which have followed the construction of practically every aqueduct and almost every reservoir in this city, one cannot but rejoice that there is a prospect of dealing with this all-important question in a civilized way. Astonishment that the proposal to eliminate politics from this field of municipal endeavor should come from a Tammany Mayor should, however, prevent no one from giving Mr. McClellan the great credit to which he is entitled. He has shown himself in this matter an enlightened executive, and should be upheld by all good citizens.

From the first it has been only too evident that the projected reform of the Turkish *gendarmerie* in Macedonia was ineffectual. Too few European officers were appointed, and those were cleverly divested of their nominal authority. Accordingly, Austria and Russia, who are primarily responsible for the discredited scheme, now bring forward a plan for financial control of the disorderly vilayets. Generally speaking, the revenues of each of the three provinces are to be detached from the Ottoman treasury and separately administered. So radical a project makes a distinct advance towards the plan openly advocated in England of setting up an administration directly answerable to the Powers—in other words, a modification of the policy so successfully pursued in Crete. Clearly, if the Austro-Russian entente adds to its pretensions to control the police the power of the purse, rather little will be left of Turkish suzerainty in Macedonia. Only the fear of worse trouble can move the dual alliance for the Balkans to stir up the question of reform at this time. But as the truce agreed upon by the revolutionary committees expires, and a new uprising seems imminent, some risks must be taken. All observers of the at present hopeless conditions in upper Turkey must long to see firm action by the European Concert soon supersede the half-measures to which Austria and Russia are traditionally committed.

Rouvier's Ministry promises to be merely a milder version of Combes's, for the new Premier is a less brilliant personality and a less convinced doctrinaire than his predecessor. In general, the new French Ministry is merely the old revamped. New elements of strength come with Etienne (the Interior) and Dupuy (Public Works). Both of these statesmen belong to the aggressive class, being advocates of colonial expansion. In the main, however, M. Rouvier and his associates will devote themselves to unfinished business—the income tax and the separation bill. Rouvier, an accomplished statistician and financier, is an indifferent manager of men. It seems unlikely that he can long hold the dwindling composite majority together, and his appointment seems merely an intermission, before the considerable reaction already provoked by the rigid anti-Clericalism of M. Combes finds a policy and a leader.

THE POLITICAL BOGEY AT WORK.

Mr. Bryan's zealous praise of the President, renewed in last week's *Commoner*, has its amusing aspects. That it is practically embarrassing to Mr. Roosevelt, there can be no doubt. His sole use of Mr. Bryan is as a bogey. "You object to my moderate regulation of your railways, do you? Well, if you don't assent to that, I tell you that Bryan will ride into power and simply confiscate your property." Naturally, it is a little awkward to have the bogey appear as sympathizer and supporter. It does not aid the President in his efforts to get Republican Senators into line, to have Mr. Bryan somewhat noisily applauding him, and intimating that Mr. Roosevelt is rapidly being converted to the true doctrine. To learn from an enemy may be good political strategy, even when he is your horrible warning; but to be enthusiastically lauded by him is disconcerting.

Mr. John Sharp Williams has been testifying to the President's political skill, which he admits the Democrats grossly underrated. A good part of it consists in denouncing the Democratic party and then quietly appropriating its issues. But the continued success of that method calls for continued political opposition. The Whigs must go on attacking the man arrayed in their stolen clothes. If they begin complimenting him on the excellent fit, it will necessarily trouble the good Conservative tailors. The latter will wonder what is to become of their business. Exactly this is happening at Washington, in consequence of Mr. Bryan's fulsome approval of the President's "vigorous fight" upon those who "prey upon the necessities of the people." There is much grave shaking of Republican heads. Senators, we understand, have gone in deep concern to Mr. Roosevelt and to Commissioner Garfield and said, "When we told you that we thought your proposed legislation soundly Republican and thoroughly conservative we did not dream that Mr. Bryan would hail it. His endorsement compels us, of course, to change our minds."

The whole situation vividly illustrates the inconvenience of owning a political bogey. It is one of the most unruly of horned cattle. We see how even a skilled ranchman like Mr. Roosevelt may be nonplussed by its antics. That Mr. Bryan is sincere in welcoming the President as his most illustrious convert, may be admitted; but if he wished shrewdly to aid in the enactment of the Roosevelt bills, he would attack them violently. They would rise like a kite against the gusts of his stormy opposition; his bland commendation threatens to make them fall in a heap. In a word, the President has rather overdone his use of Bryan *in terrorem*. To picture the fearful lengths to which an agitator will go unless the saviour of society goes half way, is certain to make men look askance at the latter. His course may be clever politics for the moment, and may pile up huge majorities; but the historically-minded will recall Louis XVI. putting on the cap of liberty, and shortly having no head to put anything on.

What the real statesman will steadily keep his eye upon is, not a bogey, but reason, justice, duty. He will not endeavor to throw the public mind into a state of panic, for then the rational faculties will not work, and out of hysterical fear social justice was never born. It is not even politically wise for President Roosevelt to say, as he does, to great railway managers: "If you don't agree to what I want done, Bryan will come along some day and wreck you." That has plainly nothing to do with the merits of the question; yet there is, of course, a certain truth in it, at which the President may be vaguely grasping. It is that the railroads themselves have provoked the demand for their further regulation by Congress; that their management has seemed to millions of American citizens to be inequitable, high-handed, and law-defying; that so a genuine grievance exists—a real injustice to be corrected—and that it is neither wise nor safe to let public wrongs of the kind go unredressed. If the President would harp more upon those strings, and not try so much to frighten Congress into his arms by pointing it to Bryan's hoofs and horns, he would have a better chance of obtaining a measure founded in sound reason and justice, rather than in terror, and so more likely to be an enduring solution of a vast problem.

Unhappily, President Roosevelt appears to believe in the Greek theory that a democracy is amenable to discipline only so long as its fright lasts. Bryan is by no means his most fearsome bogey. That bad eminence he reserves for the unnamed foreign Power which is to descend upon us and rend us limb from limb unless we make haste to build a big navy. It is distinctly an appeal to these horrible imaginings upon which he bases his pet naval policy. Ask him for a rational survey of our foreign relations, with a calm forecast of the future, and request him to point out a single cloud on the horizon, and you get only denunciation as one who would "Chinafy" the United States and make it an easy victim of the spoiler. But the really pitiable victim, we submit, is the man who cowers in terror before a bogey like that. It is not the part of a civilized man to go about distraught with baseless fears; and a naval policy buttressed by no better reason than those of the colored servant who tells her mistress, as if it were an ultimate explanation of everything, "I'm so skeered," is not the policy for a civilized nation.

THE CASE OF JUSTICE HOOKER.

The more important facts in regard to Justice Hooker of the Supreme Court of the State of New York, by appointment of Gov. Odell, have been public property ever since the Bristow report on the postal frauds, November, 1903. That interesting document showed that George W. Beavers, now under indictment, had appointed at Fredonia a clerk and two laborers, and at Dunkirk a laborer, who had drawn pay regularly but had rendered no service to the Government. The postmasters who permitted this larceny were forced to disgorge. At Fredonia and Dunkirk, also, there had been some curious increases in office rental, but the Government could recover none of this money. Mr. Bristow did not mention the name of Warren B. Hooker, but in the course of a few days it became known that Beavers, chief of the Division of Salaries and Allowances, had been conspiring with Hooker, who at the time of at least two of the frauds was Representative in Congress from the district; and that Hooker, afterwards a justice, was really at the bottom of these palpable jobs. During the year that has elapsed the subject has been discussed in the press, the committee of the State Bar Association has conducted a deliberate investigation, and Justice Hooker has had every chance to present his side.

The increase in post-office rental at Dunkirk from $1,350 to $2,000 a year, although a lease for ten years had been signed at the former figure, may be passed over; for Justice Hooker explains that the building, of which he is half-owner, cost much more than he expected when he signed the lease. The attempt to beat the civil-service law may also be set down as a minor item in the charge. Far more serious were the appointments to the Dunkirk and Fredonia offices of persons whose services were not required, and who, as a matter of fact, did nothing but draw pay. One of these superfluous employees was Maurice Hooker, nephew of the Justice. This lad of sixteen was not a resident of Fredonia, but as he wanted to attend the normal school there, the Justice and Beavers, two eminent patrons of the higher learning, generously provided for him at the expense of the Federal Government.

A yet blacker affair is that connecting Hooker with Frank P. Ball, a ticket scalper of Dunkirk. Ball owed Mrs. Hooker $3,085 for money invested in oil lands in West Virginia, and Justice Hooker devised a new way to pay old debts. He had Ball appointed first a laborer, and then a clerk in the Fredonia post-office at $600 a year. The postmaster had made no request for more help, but Hooker told Beavers that he had "a great interest in Ball." The exact amount of this interest seems to have been $600 per annum, for Ball did no work and turned over "substantially all" his salary to Mrs. Hooker. By this means the industrious Ball suc-

ceeded in reducing the indebtedness to $775. Ball received the appointment about a month before Hooker was made Justice in November, 1898, but young Maurice Hooker was not thrust into public office until 1902. So, whether we consider Hooker's activities either as Representative or as Justice, we must conclude, in the face of undisputed facts, that, even though he occupy a judicial position, the sub-committee of the Bar Association let him off easily in describing him as "morally unfit."

The Bar Association can do nothing but offer expert advice. It might, as the majority of its sub-committee recommended, have urged a further investigation by the Legislature before a tribunal having compulsory process—in fine, impeachment; or it might have agreed with the minority of the sub-committee that the facts already proved constitute cause for Hooker's removal from office under section 11 of Article VI. of the State Constitution, which reads:

> "Judges of the Court of Appeals and Justices of the Supreme Court may be removed by concurrent resolution of both houses of the Legislature, if two-thirds of all the members elected to each house concur therein. . . . But no officer shall be removed by virtue of this section except for cause, which shall be entered on the journals, nor unless he shall have been served with a statement of the cause alleged, and shall have had an opportunity to be heard."

The Bar Association, however, last week dropped, with a word of mild censure and with no recommendation to the Legislature, the charges against Judge Hooker. The only defence which the Association can offer is that its meeting was packed; that the friends of Hooker resorted to the dirtiest methods of ward politics in order to whitewash him. Quibble is the only term to apply to the resolution by which Hooker was let off. The Association "disapproves of all such political practices as are disclosed by the record in this case." To excuse Hooker's frauds upon the Federal Government on the ground that they are "political practices" is worthy of the cheapest pettifogger in a police court. If Hooker has simply fallen into reprehensible political practices, then his fellow-conspirator in looting the Treasury, George W. Beavers, now under indictment, should be acquitted on the same ground.

Another equally flimsy plea for Hooker is that in his dealings with Beavers, the most eminent of the postal thieves, he acted merely in his private capacity, while as a judge his behavior has been above reproach. This is an impossible distinction. A man who is guilty of the offences with which Hooker is charged is not fit to dispense justice in any court. Knowledge of the law, an acute mind, capacity to marshal facts and to draw logical conclusions, Hooker doubtless possesses. But these are not all the qualities needed for the bench. More important even than fine technical equipment are character and conscience. Justice Hooker has stated that he is "unconscious of having done anything wrong." Plain people with no pretension to legal learning must be shocked to discover a Justice of the Supreme Court who cannot in his own mind distinguish between right and wrong; and they must stand with Mr. Hornblower "on the broad proposition that if a jurist does anything disgraceful, he is subject to removal."

The action of the Bar Association could be regarded as nothing more than expert advice to the Legislature, with which final authority rests. Therefore, as the scandals in regard to Hooker were common talk in every corner of the State, any Senator or Assemblyman, Democrat or Republican, who cared for the reputation of the judiciary, might have moved for an investigation. Justice Hooker has anticipated this action by requesting legislative inquiry. Such is the force of public opinion, backed by more than fifty prominent lawyers of this city, without distinction of party, who had united in a petition calling for a special meeting of the local Bar Association to consider its duty in the matter.

THE MUSEUM DIRECTORATE.

By appointing Sir C. Purdon Clarke to the directorship of the Metropolitan Museum, the trustees signify their intention of emphasizing its educational function. A number of American archæologists who might have been eligible are probably the new Director's superiors in connoisseurship. One could name several business men of artistic proclivities who are at least his equal as an organizer. Unquestionably, then, there will be disappointment in certain quarters that the directorship of the greatest American museum should not go to an American; but we believe that, when the case is carefully weighed, it will be agreed that none of the other candidates combines so many desirable qualifications as the actual appointee.

The new Director brings an uncommonly varied training. For a generation he has advanced through different grades in the South Kensington Museum to its headship. He has served successfully as purchasing agent in fields so widely separated as those of Oriental and of Renaissance art. More particularly, he represents a vigorous ideal of popular education. In fact, the significance of the great institution at South Kensington, which has undergone—and not unjustly—rather sharp criticism from the *cognoscenti*, is that it has shown an openhanded and enlightened hospitality to all students of the history and practice of art. In a hundred ingenious ways it has furthered this end. Its curators are at the service of every serious inquirer. By the distribution of reproductions of all sorts, it aids private students and smaller institutions throughout the world. Its system of exhibition and labelling is planned to give the visitor the most essential information in the most convenient way. Needless to add that it offers lectures on a great variety of topics in arts and crafts.

Evidently, the introduction of such a spirit into the management of the Metropolitan Museum is a matter for profound congratulation. It means that the student will henceforth have the consideration always enjoyed by the casual visitor, and that the hundreds of thousands of casual visitors who annually pass through the galleries will be offered every opportunity and inducement to become in a measure students. Bringing this experience and enthusiasm, the new Director should soon make the Museum, which has in the past had too much the character of a vast curiosity-shop, a genuine home for all who concern themselves seriously with the arts.

The *Evening Post* has urged the pressing need of rehabilitating the Museum before the world of scholarship by a prompt and radical overhauling of the collections. The *Tribune*, on the other hand, takes the genially agnostic position that such a revision is either impossible in the near future or undesirable, or at least had better wait till all the so-called experts cease disagreeing. We fancy that Sir C. Purdon Clarke will not share our neighbor's optimism to the extent of expecting the happy advent of critical unanimity during his administration, but will rather proceed to set his house in order, and to remove the reproach which by laxness in scientific management previous housekeepers have left him as a legacy. To do this most needful work he will require curators of the very highest attainments. In fact, the efficiency of the cataloguing and purchasing departments calls not only for a staff of expert curators, but for autonomy, department by department. Subject to proper safeguards, a museum thrives best when the Director is a Czar, but a Czar sagacious enough to trust his privy councillors. In other words, to gain the real benefit from the change, the new Director should, once budget and general policy are approved by the trustees, enjoy complete independence of action. Various suggestions of trustee committees for internal administration or of outside advisory bodies by no means commend themselves as practical. The ideal is perhaps the organization of the Louvre: the Director subject to the Ministry of Fine Arts (the trustees), the curators independent in their departments, but subject, in the case of acquisitions, to the joint approval of the curators. Such an organization secures initiative and promptness, indispensable qualities for any successful competitor in the narrowing art-market of the world.

Accordingly, as we congratulate Mr. Morgan and the board of trustees upon

the wisdom of their choice, we also hope that a habit of direct management, quite justifiable under the old, will not be carried over into the new régime. Mr. Morgan and his associates will administer their great trust most acceptably by giving the greatest possible liberty to so very competent a representative as Sir C. Purdon Clarke.

CLUB DEFICITS.

A club has been defined, not inaccurately, as an organization in which nine men who stay away contribute to the comfort of one who goes. It is one of the least successful forms of charity, apparently, for the nine never give quite enough, and the one fellow in the club never admits that he is reasonably comfortable. Hence club deficits are almost as much a matter of course as entries in the complaint-book. Deficits are borne with various degrees of fortitude. The Union Club, for example, whose finances have been perhaps unnecessarily prominent in the press, plans merely some trifling retrenchments. A neighboring organization of marked plutocratic complexion simply assesses its members annually as a matter of course. Nobody winces, it is said, because nobody uses the club; the game is fair all around. Many less pretentious clubs pursue an ostrich plan, hiding considerable deficits under more or less fantastic bookkeeping credits until the day of reckoning comes.

Since clubs, like armies, march on their stomachs, gourmandise may fairly be said to be the root of these financial evils. To the dining-room and kitchen is charged more than three-quarters of the current deficiency of the Union Club. A club with a large artist membership has for years past turned over a quarter of its fixed income to pay the café deficit. Even more striking was the case of our largest athletic club, which, with an enormous membership and good attendance, accumulated annual deficits of five figures, until one of the stewards was put in full control. Straightway the service improved, and the contractor, now one of the best-known restaurateurs and hotel keepers in town, began to reap personal profits corresponding to the previous losses. In fact, his success was so phenomenal that the club could not afford to keep him, being in the position of an investor whose 2 per cents have crossed par.

The incident, which might be reinforced by many others, shows pretty clearly that the problem of club and restaurant management are nearly identical. Only a year or two ago we saw in common embarrassment on this score a club devoted to old-school Republicanism and one attached to tariff reform; bloated protectionists and gaunt free traders were equally costly table boarders. The desideratum, then, is to find a House Committee chairman who is a thrifty and skilful caterer—in other words, a man who will superadd to his regular vocation the training of a restaurant-keeper—a very complicated business in itself. And for service that undertaken professionally would command a handsome salary, a House Committee chairman has merely his own pains, and, usually, the imprecations of his fellow-members. For your fastidious clubman will curse at the variation of half a degree in the temperature of his claret; divine discontent fills him when the end of a fortunate bin puts it no longer in his power to drink a *château* bottling at an *ordinaire* price. Smithers is outraged if his cheese will not stand upright, Juggins is pained unless his runs enticingly upon the plate. Such is the temper of the "tenth man" to satisfy whom, without hopelessly alienating his treasurer, is the House Committee chairman's bounden duty.

With labors at once so onerous and carrying so little appreciation, it is no wonder that the supply of competent chairmen is smaller than the demand. There are seventy clubs of some social prominence in this city; probably one hundred and fifty at least which have restaurants. This represents several regiments of House Committee men who have fallen by the way; but we have yet to hear of an old man's home for deserving persons of this class, or of any other form of public recognition of a profession which must surely rank among the extra-hazardous occupations.

So keenly has this been felt that certain clubs have paid a member in cash or perquisites for giving all his time to the management. This practice, not uncommon, we are informed, in England, runs counter to American ideals of good club ethics. Practically, then, the problem of management reduces itself to securing honest and efficient stewards. Such men are more precious than rubies, and about as scarce. To hold them is difficult, because the ability to discipline a force of servants and to restrain the wastefulness of cooks and marketers and the wiles of tricky tradesmen will command a higher salary than most clubs are able to give. But here, fortunately, considerations of loyalty frequently prevail, while permanency of tenure and agreeable associations outweigh speculative opportunities.

The rise of an occasional House Committee chairman of genius is only the exception that proves the rule of mediocrity. In this matter as in others the amateur cannot hope to compete with the professional. The production of honest and capable club stewards is the desideratum, and the discouraging feature of the case is that many men of this class have had a training, as waiters or otherwise, that makes against direct and disinterested dealing. The calling should have a recognized standing, for the money reward would always be sufficient to attract men from salaried positions in general business. Until a better class of club stewards is found, club deficits will continue to be the rule, and the nine men at home who provide for the one man at the club will be assuming a task only a little less satisfactory than that of the Danaids.

THE INTERNATIONAL SOCIETY IN LONDON.

LONDON, January 7, 1905.

The International Society, though the Exhibition just opening in the New Gallery is only its fifth, is already the most formidable rival the Royal Academy has ever had. It grew out of what may be called an English Secession. By its choice of M. Rodin to succeed Whistler as President, and the many foreign names in its list of members, it has shown its readiness to be as International in fact as in name; in a word, it has adopted since the start such a strong policy that one must regret the more any signs of weakness by which its influence in the country might be lessened.

One cause of its strength is its equal recognition of the three arts it represents. In England, painters monopolize most of the exhibitions. In France, it is true, sculptors receive due consideration, but, even in France, the poor engravers are apt to see their work thrust into odd corners, and hung as if the only object were to have it take up the least wall-space possible. The very title of a society of "Sculptors, Painters, and Gravers," however, carries responsibilities with it, and these responsibilities are not shirked. The painters are still in the majority, but the "gravers" are treated with a deference seldom accorded to them elsewhere. They have to themselves one of the three rooms at the New Gallery, or, rather, they share it with the draughtsmen in different mediums who, for exhibition purposes, are usually classed with them; and the prints and drawings have been so judiciously selected, and hung with such distinction, such appreciation of a decorative whole, that this room is the most effective of the three, and promises to be again, as it was last year, the centre of success. It is a triumph especially for American and Dutch artists, from whom much of the most remarkable and most distinguished work has come.

American illustrators and engravers have never made so fine a showing in London before. There are groups of wood engravings from Mr. Cole and Mr. Wolf; Mr. Cole sending a series of proofs of his blocks after the English landscape painters—Constable, Crome, Cotman, Wilson, Turner—those wonderful little prints that, in black and white on a few inches of paper, seem to preserve for you all the life and atmosphere and light and even color of the originals; Mr. Wolf contributing his reproductions of more modern pictures, chiefly portraits, the series culminating in the print after Whistler's "Little Lady Sophie of Soho," a really wonderful performance, so well has Mr. Wolf suggested the very feeling and strange charm of the painting. There is no need for me to go into a more detailed description,

for all this work by Mr. Cole and Mr. Wolf is already well enough known at home. The great thing now is to see it, in such fine proofs, hanging in a London gallery. Then, Miss Mary Cassatt, who is so seldom to be found anywhere out of Durand-Ruel's, is represented by a set of etchings printed in color that are among the most successful, technically, ever produced by a Western artist. The color is pure and brilliant and gay. Many men who have been trying their hand at color-printing never seem to want—or, it may be, they never know how to get—anything save dingy blues and murky reds. But Miss Cassatt's color-schemes have all the gayety, and her tints all the brilliance, of the work of the Japanese, by whom, indeed, it is evident she has been as strongly influenced in design—in the way of placing her figures and balancing her spaces of reds and blues, grays and yellows. But it is a good influence, and she has adapted Japanese methods to subjects that intelligent study of Degas have made her own. Her mothers and children, her women at their toilet, are essentially European, essentially the models her life and surroundings have provided, and they are as graceful, as characteristic in their way, as are the women and children of Utamaro in theirs. There are also etchings by Mr. Joseph Pennell, the "Sky-Scrapers of New York," that have not yet been exhibited in America, and by Mr. McLauglan, his motives found largely in the old streets and the old houses of the French towns. I have never seen better work by Mr. Albert Sterner, who does not always maintain his own level in the magazines, than a strong portrait in chalk of Mrs. Humphry Ward, full of observation and character. And pastels, notable for their decorative arrangement, by Mr. Fromuth, and charcoal drawings by Mr. Mura, complete a list which, if comparatively short, includes much of the best being done by Americans to-day.

The work by Dutch artists is equally strong, for chief among these artists are Matthew Maris, the master of the older generation, whose etchings, both of figures and of landscape, have the elusive quality of his paintings, and are so rare that I doubt if they have ever been seen in America, or ever will be seen again in a public exhibition in England; and Bauer, the coming man in Holland, whose prints, a vindication of the big plate, are the same that won him the Grand Prix in St. Louis, and who also shows two or three of the large shadowy water-colors in which, as in his etchings, good, sound drawing is the basis of the mystery with which he likes to envelop his every subject. There are etchings, too, by Dupont, large in design, vigorous in handling; and by Wittsen, whose Canals of Dordrecht are careful and sometimes effective, but not without an element of dulness.

I do not mean that all the good work must be credited to Holland and America. A striking collection comes from France, with two drawings by Rodin to set the standard. These are really notes and memoranda of subjects and compositions such as the old masters used to jot down for their own use, and not the sham old-master drawings some of the younger men to-day in England produce as their masterpieces to exhibit to the public. Both were in the International Exhibition that last year made the tour of several American towns, but both have come back unsold, though I notice that, even before the exhibition here has opened to the public, one has been bought. It looks as if Rodin were still but a name to the American. The etchings by M. Louis Legrand and M. Lepère alone would give distinction to any collection of black-and-white, for they are men who see for themselves—Lepère, the architecture he loves, Legrand, the most modern type of woman and the most modern phases of life; and alike they have the courage to express what they see according to their own methods. For this reason, their work strikes one more in London than in Paris; the artists just now most in evidence in London being men who see everything through the prints of older masters, and who express everything as it has been expressed in the past, so that their etchings and lithographs and wood-engravings are really but "British Museum-and-water," as I have heard them described. The color prints of M. Thaulow, M. Gaston La Touche, and M. Raffaëlli are amusing technical achievements, and, if I dwell upon them at no greater length, it is simply because the collection is so good as a whole that I have not space to do more than point out the things that make it good. From Germany comes little except one masterly study of hands in pencil by Menzel, etchings by Klinger, and brilliant water-colors by Von Bartels; from Spain, little except the drawings by Vierge for 'Pablo de Ségovie.' I must confess it is with disappointment I find them here, for, like the Rodin drawings, Vierge's illustrations were exhibited in many American towns, and I had thought there would be at least one museum in America to realize the advantage of possessing a series of designs not only so amazing in themselves, but of such genuine value to students, of such tremendous interest in the history of illustration. They simply *made* modern pen-drawing for "process." Among the works of Englishmen, the illustrations and chalk drawings of the late Frederick Sandys are prominent. The series of his illustrations in the New Gallery is complete, and includes fine proofs of the engravings. Other English exhibitors are Mr. Nicholson, who, however, sends none of the prints which I, anyway, prefer to his water-colors; Mr. Conder, whose dainty fans, in America, shared the same fate as Rodin's drawings; and Mr. E. J. Sullivan, who has done no illustrations of greater distinction than the eight or nine designs for the "Rubáiyát," now shown, but still unpublished.

The care devoted by the Society to the decoration and arrangement of the galleries is nowhere more apparent than in the Sculpture Hall. The court of the New Gallery, a banal affair of colored marble and gilding, has been turned into a white temple, by shutting it in with temporary white-draped walls, to which the railing of the balcony above (a feature ordinarily not to be noticed one way or the other) serves as a golden frieze. The green of a few well-placed plants breaks the severity of these walls, without, however, destroying the simple dignity of the effect, but I am afraid only the artist will feel, as it should be felt, the subtle beauty of the white of marble and plaster against the softer white of the draped walls.

Rodin sends nothing as impressive as "Le Penseur," the great Titan that, last year, sat brooding, high above the crowd, in the centre of the court. His chief work this year is one of the creations in which he seems to set at defiance all the laws that have, until now, governed the world's great sculptors. "La Main de Dieu," he calls it. From a distance the large marble—a small plaster cast is placed beside it—is an inchoate, shapeless mass, with no beauty of outline, no grandeur or loveliness of form. From a block of marble emerges a gigantic hand holding what appears to be a rugged boulder until, as you draw nearer, you see, gradually taking shape from out the marble, the nude figures of a man and woman, delicately, tenderly modelled, one long flow of rhythmical line in the posing and grouping of the two bodies. You may read into it what meaning you will, but you cannot deny the beauty of the two figures thus shaped out of chaos by their creator: a beauty, however, which you do not see until you are close to it, which cannot dominate an entire gallery as the masculine, the heroic beauty of "Le Penseur" did a year ago. This is Rodin's most important contribution, though he has also a large study of a "Femme Couchée" in plaster, and a by no means remarkable bust in marble of Mr. George Wyndham.

After the Rodins, nothing is as notable as the work of M. Glicenstein, an artist whose name is unknown to me, but in whose bronze bust of D'Annunzio, with its unmistakable truth—the head seems to explain the novels—and "Sphinx Group," with nothing sphinx-like in its frank admission of Rodin's influence, there is much promise, if less individuality in accomplishment. Had I more space, I should like to speak at length of the statuettes by Mr. Wells, the portrait bust by Miss MacLaren, the statue by Mr. McGill; there would be much to say also of the jewelry of Mr. Cooper, the enamels of Mr. Alexander Fisher, the silver of Mr. Nelson Dawson. If the collection is small, almost everything in it is worth seeing, and the advantage of its being small is that everything can be seen.

I have left the paintings to the last, because I think they have scarcely been selected with the same care, or judged by the same high standard, or arranged with the same distinction, as the prints and the sculpture. It is in this section that I cannot help being conscious of regrettable signs of weakness. Much that is commonplace, and worse, has not only crept in, but been treated with unexpected deference and placed prominently, and this is unpardonable in an exhibition that pretends to admit nothing but the most important and most individual work now done, not merely in Europe, but in America, too. Several distinguished members are content to be represented by their least distinguished performances. M. Cottet, for instance, is positively insignificant after the impression he made on the same walls a year ago with his large, solemn "Deuil Marin." Other members do not send at all. Sir James Guthrie is absent. So are Zuloaga and Anglada, whose canvases certainly had the merit of daring and vivacity, but they now give way to those of another Spaniard, who would be passed unnoticed even at the Old Salon. One of the disappointments to me is that the Americans, who are so strong in the black-and-white room, are here so weak.

I have seen it announced that Mr. Chase—who himself sends his portrait of Whistler—was the appointed delegate to select the American pictures, but it seems almost impossible that he could be responsible for a selection that, with one or two exceptions, is so absolutely feeble and devoid of result. He had so much to choose from; for, while the Americans at work in Paris and London are well enough known here, the Americans at work in America are hardly known at all, and it is high time they should be.

But I must not give the impression that there is no good painting. There remains much that is interesting, or even fine. There are portraits by Mr. Lavery, the Vice-President; Mr. Nicholson, whose "Belle Chauffeuse" proves that picturesque effects may be discovered in the most practical modern dress; M. Blanche, who, however, has not made the most of a sitter so full of possibilities as M. Rodin; M. Simon, who has painted M. Blanche—posterity will have no difficulty in forming a gallery of the portraits of the artists of to-day by their contemporaries; Mr. Sauter, whose large full-length, "Mrs. Nico Jungmann," is one of the few attempts to give a delicate harmony, a subtle study of tone, as well as a realistic presentment. It is Mr. Sauter also who has the one important nude, "Bridal Morn," inspired, perhaps, by some vague, unconscious memory of Titian's "Sacred and Profane Love"; for its motive is the contrast between a nude and a richly draped figure—only Mr. Sauter has worked this contrast out in his own fashion; his two women stand against a window, through which the sunlight falls, and it is the effect of atmosphere which has been his chief concern. There are landscapes by M. Thaulow—one of his marvellously true studies of snow—Mr. Peppercorn, M. Raffaëlli, Mr. Priestman, Mr. Mark Fisher. A tremendously vivid, well-modelled peasant girl by Von Bartels is so strong that everything near it simply disappears, and this, too, I believe, toured America unsuccessfully. A "Gypsy Family," by C. H. Shannon; the charming "Place Chateaubriand, St. Malo," by Mr. Morrice, from last summer's New Salon; Millet-like groups of mother and child by Mr. Strang; tender little fantasies by M. Aman-Jean, also seen but unappreciated in America—all these and many more form a collection that anywhere else in London would seem more remarkable, and that show how entirely the International has the courage of its name in its liberal attitude to the artist abroad as well as at home.

It may be to the credit of the Society that it has any exhibition of its own this winter, for a great part of the time and energy of the Council has necessarily gone to preparing the Whistler Memorial Exhibition which is to open in the New Gallery at the close of the International, on the 22d of February. Many important pictures have been obtained. M. Loubet has granted a special permission for the loan of the "Mother" from the Luxembourg—the first time such a concession has ever been made to a foreign private society, and it does honor to M. Loubet no less than to Whistler. The "Carlyle" is coming from Glasgow, the "Sarasate" from Pittsburgh, other pictures from the Boston Museum, the Chicago Art Institute, and private collectors in England, on the Continent, and in America. The King has lent his Whistler etchings from the Royal Collections at Windsor; in black-and-white alone there will be almost five hundred examples. Altogether, the Exhibition promises to be more representative even than the magnificent show in Boston. And every American owner of Whistlers should prove his appreciation by lending them to round out and complete the Exhibition organized by the society of artists of which Whistler was the President, and so help to make it in every way worthy of the great man to whose memory it is a tribute. N. N.

Correspondence.

BIBLIOGRAPHICAL STANDARDS.

To the Editor of The Nation:

Sir: In his defence of Mr. Griffin, in the last number of the *Nation*, Mr. Lindsay Swift makes a couple of statements that ought not to go unchallenged, as they affect questions of principle, wholly aside from the disputed publications.

He says that Mr. Griffin's lists "seem practical and timely, wholly aside from the question of their . . . accuracy," and suggests that the reviewer might have overlooked or underestimated "the help probably rendered to others besides scholars and thorough investigators." "As a rule," he says, "experts can look out for themselves." Yes, within their own specialties. But an historian or an economist can hardly be expected, "as a rule," to unravel mysteries caused by careless bibliographers, any more than a bibliographer can presume to solve those that have grown out of the carelessness and ignorance of mediæval scribes. That the average scholars are more or less helpless in handling bibliographical material, must be clear to any one who has had occasion to use the "bibliographies" which they append to their books. The statements that inaccurate bibliographies may still be "practical," and that "any [presumably no matter how inaccurate] elucidation which clears [!] the tangle of books on many subjects is just so much to the good," are very dangerous doctrines.

Mr. Swift further says that the lists have impressed him "as standing somewhat to bibliography as newspapers do to literature." What would he say if Harvard University should publish a newspaper in the place of the *Quarterly Journal of Economics*? Aksel G. S. Josephson.

Chicago, January 16, 1905.

Notes.

'A Short History of Venice,' by William R. Thayer, author of 'The Dawn of Italian Independence'; a work on 'The Bahama Islands'; a 'Life of Florence Nightingale,' by Miss Sarah A. Tooley; and 'Problems of the Panama Canal,' by Gen. Henry L. Abbott, U. S. A., will shortly be published by the Macmillan Co.

McClure, Phillips & Co. announce 'The Color Line,' by Prof. W. B. Smith of Tulane University.

Cassell & Co. publish directly 'Fifty Years of Public Service,' by Major Arthur Griffiths; 'The Other Side of the Lantern,' a world tour, by Sir Frederick Treves, Bart.; 'Canada, at Work and at Play,' with a chapter on Newfoundland, by A. L. Haydon; 'Strategy, Illustrated by British Campaigns,' by Captain Macquoid; and 'The Handyman's Book of Tools, etc., in Woodworking,' edited by Paul N. Hasluck.

The New England Historic Genealogical Society, Boston, now offers the first volume of the most important series ever undertaken to facilitate genealogical research in the mother country. We refer to J. Henry Lea's 'Historical, Genealogical and Topographical Abstracts of Wills in the Prerogative Court of Canterbury, at Somerset House, London: Register *Soame*, 1620.' That is, Mr. Lea gives in 600 pages "concise but exhaustive abstracts of *every will* proved" in that court during the year named, viz., 1366 in all, with 40,000 references to persons and 10,000 to places, all thoroughly indexed. It is hoped to continue this sweeping work for the decade 1620-1630, and even to the end of the seventeenth century. We shall thus have a fine outcome of Mr. Waters's 'Gleanings,' Mr. Lea's predecessor in this rummaging. The volume may be had for six dollars of N. C. Nash, treasurer of the Society, Somerset Street, Boston.

At a recent meeting of the Bavarian Academy of Science, Professor von Woelfflin reported that the first two volumes of the 'Thesaurus Linguæ Latinæ,' in large folio form, are rapidly approaching completion. The editors have decided to limit materially the space devoted to proper names, and have sent out instructions to their colaborers to make their articles as brief as possible, so that the work will conform, on the whole, quantitatively to the original programme set before the subscribers.

The four volumes of the late Lafcadio Hearn's writings about Japan, just reissued in uniform style by Little, Brown & Co., Boston, date back as far as 1898 for the earliest. Together they offer an extraordinary variety of *aperçus* of Japanese character and customs and beliefs, subtly apprehended, and expressed in a style infused with sympathy, phantasy and color. In 'Shadowings' one may read of Japanese female names, whose translation is impossible without a knowledge of Chinese also—"*Kana* give only the pronunciation," and "the chief and, for the present, insuperable obstacle to the use of Roman letters in writing Japanese [Romaji] is the prodigious number of homonyms in the language." Or take the section on the frog in 'Exotics and Retrospectives,' which sets out with the observation that none of the numerous poems on this creature refers to its clamminess; passes through a consideration of Japanese tactual sensations, the absence of physical display of affectionate feeling by hand-clasps, kisses and the like; and ends with a call to admire "my Kyōto tobacco-pouch, with centipedes of gold running over its figured leather like ripplings of gold." So, at page 190 of 'In Ghostly Japan,' the howling of his dog leads Mr. Hearn to reflect that "only by eating each other do beings exist—You cannot even drink without swallowing life"; and that "the faith of the Far East meets that problem better than the faith of the West." 'A Japanese Miscellany,' finally, offers attractive read-

ing about songs of Japanese children (nearly a third of the book), and descends to their "method of bolassing dragon-flies," among other modes of capture.

The new edition of Nares's 'Glossary of Words, Phrases, Names, and Allusions,' particularly relating to Shakspere and his contemporaries (Dutton), is that put forth in 1859 with addenda by Messrs. Halliwell and Wright. Its illustrative value has hardly been impaired by time, or can be; but meanwhile the Oxford English Dictionary has appeared with its vast enrichment of the same field, and with its scientific etymologies and chronological array of quotations. Thus, Nares give us "HADE. Apparently a high pasture. I see no probable origin for it but the Saxon *had*, or head. [There follows a couplet from Drayton.]" Dr. Murray says, "derivation unknown," and defines: "A strip of land left unploughed as a boundary line and means of access between two ploughed portions of a field; also [but doubtfully, etc.]." The same extract from Drayton is appended, but one nearly a century older from Fitzherbert precedes it. On the same page of Nares one may compare what he has to say about *hacqueton* (haqueton), *had-I-wist*, *haggard*, and *haight* (hait) with the corresponding rubrics in Murray. Nares, with less knowledge, supplies fuller (not more numerous) examples than the Dictionary could afford. Haggard, by the way, he defines as "a hawk not manned or trained to obedience"; Murray insists, a *female* hawk. One might do worse than possess Nares for the useful discipline of going through it in company with the Oxford Dictionary, which supplements and corrects it at every turn.

There is certainly need of a popular history of the United States, better proportioned and more authoritative than Bryant and Gay, and more comprehensive than Fiske, This need Dr. Elroy M. Avery has sought to supply in his 'History of the United States and its People' (Cleveland: The Burrows Brothers Co.), the first volume of which has lately appeared. Mechanically the book is sumptuously got up; indeed, it is one of the handsomest pieces of bookmaking that have recently come to hand. There is a profusion of pictures, all well executed, and most of them of historical significance, though we must regret the introduction of such a meaningless conceit as Harry Fenn's "Sea of Darkness" (p. 68). The maps are a notable feature, the reproduction of old maps and sketches being unusually well done. A commendable feature is the notes accompanying the table of maps and illustrations, many of these being contributions as important as the text itself. Dr. Avery's text stands well the test of critical examination. The narrative, covering in this volume the period down to the end of the sixteenth century, and including chapters on American archæology and the aborigines, is systematically compressed, but it is well proportioned, and gives evidence throughout of careful use of authorities and of intelligent and restrained judgment. As the volume has had the benefit of unusually extended revision at the hands of experts, perhaps there is a division of honor to be recognized; but the book is Dr. Avery's after all. From a literary point of view, this history is eminently readable, though the style shows a tendency to ornateness. The omission of foot-notes is compensated for by a well-chosen bibliography at the end. The work is to extend to twelve volumes. If the remaining volumes are carried out as well as this one, we shall have a worthy popular history.

In 'The Hardy Country' (London: Black; New York: Macmillan), Mr. C. G. Harper traverses ground that he is by no means the first to describe. Mr. Windle's 'The Wessex of Hardy' was so exhaustive that little was left for later pilgrims to identify and illustrate. Mr. Harper is less of an antiquarian than his predecessor, and he writes in a lively style all his own and not out of place in a work necessarily rambling and full of anecdote. He contributes yet another map of the Hardy country, and his book is illustrated by his own attractive sketches of Wessex villages, and by photographs of the more famous literary landmarks of the Wessex novels. His readers will probably agree that the most interesting of the sketches are those depicting the little cottage in which Mr. Hardy was born in 1840. It is still occupied by members of the Hardy family. "You enter its garden up steep, rustic steps, and find its low-ceiled rooms stone-flagged and criss-crossed with beams. At the back, its walls, with small latticed windows, look sheer upon a lane leading into the heart of the woodland. . . . Branches of those enshrining trees touch the thatched roof and scrape the walls, and the voices of the wind and of the woodlands reverberate from them. . . . It is an ideal spot for the birth of one whose genius and bent are largely in the interpretation of nature." In the course of his pilgrimage the author came to Winterslow, where poor Hazlitt lived for nine years in sulky seclusion, and wrote the essay "On Living to One's Self"; to Eastbury, the vast mansion of Earl Temple, who offered in vain an income of £200 a year to any one who would reside there and keep it in repair; to the village of Pentridge, where is to be seen the absurd tablet erected by the poet's admirers to Robert Browning's "first known forefather, formerly footman and butler in the Bankes family" ("All service ranks the same with God"); and to many other secluded places of interest, an interest not limited by their connection with the novels of Mr. Hardy.

Major C. E. Dutton, United States Army, has written for Putnams' Science Series a lucid account of the present state of the scientific study of earthquakes. The book contains a description of the modern instruments designed for recording earthquake shocks, chapters on the nature and causes of earthquakes, and an exposition of the mathematical treatment of the theory of earthquakes, in language which the general reader can understand. One of the most important of the conclusions of modern seismology emphasized by the author is the relative insignificance of volcanic action as a cause of earthquakes, even in a country like Japan. Major Dutton ascribes the fracturing and shaking of the earth's crust to forces of elevation and depression. What these forces are, the author believes to be a matter for future discovery and explanation. In an appendix there is a list of earthquakes, tabulated according to regions and the intensity of the shocks, which affords the most concise summary of the distribution of seismicity obtainable.

The distinctive merits of 'Murray's Small Classical Atlas,' edited by G. B. Grundy (Henry Frowde), are a liberal scale and a representation of natural configuration by tints, thus ensuring the utmost clearness in the names of places. The customary maps are supplemented by a plate showing fourteen battlefields notable in Greek and Roman history. In the case of England, France, and Palestine, modern names are subjoined to the ancient; elsewhere this laudable practice is omitted, which is all the more to be regretted because the index is not availed of for this purpose. Nothing is more interesting to the classical schoolboy, for whom this work is intended, than to learn of such identifications, and trace the phonetic decay by which the modern name has often been evolved from its predecessor. As it stands, however, this atlas is very handsome, extremely legible, and moderate in price.

A 'Check List of Foreign Newspapers in the Library of Congress' has been compiled by Allan B. Slauson and published by that institution. It shows that the Library has very good beginnings of a collection of this material, already the largest in the country. The various *Mercurius* issues of 1648-1656 are among the earliest of the English news-letters, and there is nothing earlier from the continent of Europe than the Dutch issues of 1766-1780, and a notable file of the *Gaceta de Madrid*, beginning with 1753 and reaching, with breaks, to the present time. The political experiences of French journalism are hinted at in notes. Spanish-American papers are very well represented, and will prove a storehouse of information for the historian; but the corresponding Philippine issues are absent —an unfortunate omission.

In his report to the Carnegie Institution on the Diplomatic Archives of the Department of State, 1789-1840, Mr. Andrew C. McLaughlin indicates the wealth of historical material which these records contain. Not more than one-fourth of the total number of dispatches and instructions have been printed in the State Papers. Only such documents, or parts of documents, were included as the question immediately under discussion seemed to demand; and the supposed need for diplomatic reserve resulted in some curious treatment of the dispatches. A few sentences only were given from a letter of many pages; paragraphs were mutilated beyond recognition; and matter of essential value to the historian was omitted, without any indication of such omission. The indiscretions of the writers required some pruning, and the occasional frank expression of opinion could hardly have been made public at the time; but, even with such allowance, it is surprising how far the censorship was carried, and how much legitimate news was suppressed. Some part may have been communicated to the newspapers of the day; but the fifteen examples given in the report whet the appetite for more. The letters from John Quincy Adams and William Short are particularly good. That this report may induce the Government to print these diplomatic records is greatly to be desired.

The *Library Journal* for December last is occupied wholly with the Proceedings and papers at the Library Section of the International Congress of Arts and Science at St. Louis in September. It is rich in gen-

eral discussion and in practical details in every branch of the craft. We will instance Salome C. Fairchild's impersonal investigation of the relative employment of men and women in American libraries. She notices at the outset the astonishing growth in the proportion of women in attendance at the conferences of the American Library Association. At the first, in Philadelphia in 1876, there were but 12 women out of 103 members present; at Chicago in 1893, 166 out of 805; at Magnolia in 1902, 736 out of 1,018. Mr. James D. Thompson, of the Library of Congress, reported progress on his 'Handbook of Learned Societies' the world over, which is now in press for completion next month.

The principal feature of the *National Geographic Magazine* for January is the paper by Mr. Z. F. McSweeny on the "Character of Our Immigration." It bristles with facts and statistics, and contains some noteworthy suggestions. In view of the coming into our life of multitudes of peoples of whose traits or habits we know little or nothing, the writer advocates the study of racial geography in our colleges to determine the economic, moral, and social effect on the community of these aliens. It is somewhat surprising to learn that the Syrians are the least desirable of the foreign element. Attracted, apparently, first by the World's Fair of 1893, they have since then scattered over the whole continent, and "are the toughest problem that official and private charity has to meet in the communities in which they live." On the other hand, "during the past few years in New York . . . the Jewish children have obtained more honors than all the others put together." According to the latest report of the Commissioner, the number of immigrants into this country since 1820 is 21,905,684. Mr. McSweeney is in error when, referring to the early opposition in this country to immigrants, he says that William Penn (who died in 1718) "as early as 1765 . . . expressed himself as being apprehensive of the coming of the Pennsylvania Dutch to his colony." Of great interest are the illustrations of this number, consisting of characteristic scenes at the Ellis Island Station, and reproductions of photographs of Lhasa presented to the National Geographic Society by the Imperial Russian Geographical Society.

Lemcke & Buechner, 11 East Seventeenth Street, are the New York agents of the humorous Munich paper, the *Meggendorfer-Blätter*, whose pictorial comicalities are plundered for the columns of our Sunday papers without improvement in the process.

The University of Berlin has begun an innovation of special interest to foreign students. A Bureau of Information (*Akademische Auskunftsstelle*) has been established, which will offer its services also to others than university students, extending help to all who may be engaged in scientific pursuits in the German capital. Indeed, the programme includes information by correspondence with inquirers from abroad. The Bureau's quarters are on the ground floor of the University building. German learned journals urge the establishment of such bureaus in other university centres. The University of Munich has a similar arrangement in its "Arbeitsamt," which secures work of various kinds, such as private tutoring, examination of sources, proof-reading, and the like, for students who need to earn their support. The good offices of this institution are offered to students of all nationalities and confessions, and are given free of charge.

The Munich *Allgemeine Zeitung* (*Beilage* 264) contains a warm plea, from the pen of an experienced teacher, Dr. H. Molenaar, of Munich, for shorter hours and a single daily session in the Realgymnasia of Germany, where, according to the present schedule, the pupils are engaged in class work from six to seven hours daily, and have from three to six hours additional preparatory work to be done at home. The writer declares it to be impossible to cut down the course and still furnish a good education on a modern basis, but maintains that the whole work could be crowded into the morning hours, with recitation periods of forty minutes, and is convinced that, with this arrangement, which leaves the afternoon for recreation and bodily exercise, the amount accomplished will in the end be as much as or even greater than under existing circumstances. He gives a tentative schedule of the new order.

By an inadvertence, in noticing last week Dr. Asakawa's 'Early Institutional Life of Japan,' we omitted to name the American publishers, Messrs. Scribner.

We must do Prof. Mace, author of the 'School History of the United States' which we briefly characterized last week (p. 52), the justice to say that the types made us express just the opposite of our intention concerning "the arrangement and the presentation" of his work. For "very *un*satisfactory" we had written "very satisfactory." He has our apologies.

—Robert Elward's little book 'On Collecting Engravings, Pottery, Porcelain, Glass, and Silver' (London: Edward Arnold; New York: Longmans, Green & Co.) belongs to the "Wallet Series," of which other volumes deal with 'Hockey for Women,' 'Water-Color Painting,' and 'Dress Outfits for Abroad,' in pleasing variety of subject. It is really a curious experiment in saying in very few words—22,000, perhaps—all that is most likely to be needed in the way of advice to beginners in collecting in five interesting and important branches. There are, indeed, deliberately chosen omissions which strike one as odd. Engraving on wood is mentioned only as of Dürer and Bewick, with three other names given on pages 8 and 9, and is then dropped, with not a word about the conditions of study and purchase. Sèvres porcelain is not mentioned, and it is avowed (p. 59) that "this chapter is intended to be a description of *English* porcelain," while no other chapter is given to Sèvres or any other Continental porcelain, save a few words about that of Dresden. The splendid French faïence, from Rouen to Moustiers, is left without notice; but indeed the book assumes that English collectors will care for English arts alone. A generally sagacious tone of advice and comment is to be found in the book. The hints, even when extremely naïve, are still of the right kind. What is said about "states" in prints from etchings and engravings is very much to the purpose, and the precautions suggested to the unwary or inexperienced buyer are good ones to keep in mind. Decided errors are few; but it is a pity to leave the reader with the idea that "soft porcelain" is a coequal variety of porcelain, instead of an accidental result of a search for something else; and also that iridescence (p. 65) in ancient glass comes of "wear," instead of long inhumation and the result of the chemical action of the covering soil.

—Under the title 'Poverty' (Macmillan), Mr. Robert Hunter presents a very gloomy picture of the life of a great part of the population of this country. He assures us that he has not the slightest doubt that there are ten million persons in the United States "pursuing hopelessly the elusive phantom of self-support and independence." He admits that he is "largely guessing," but thinks that there may be as many as fifteen or twenty millions. These people, "although using their best efforts, are failing to obtain sufficient necessaries for maintaining physical efficiency." In Pennsylvania, "that State of colossal industrial crimes, one hundred and twenty thousand little ones were, in the year 1900, sacrificing a part of their right to life, most of their right to liberty, and all of their right to happiness except of a bestial kind." The number of persons in distress in Boston and New York, according to Mr. Hunter, may equal, proportionately, the number of those in London. About 10,000,000 of the persons now living will, if the present ratio is kept up, die of tuberculosis. Nearly half the families in the country are propertyless. We fear that this method of pleading the cause of the poor will not advance it. Hysterical shrieks do not take the place of facts, and nothing is more fatal to reform than to have reformers make themselves ridiculous. One of Mr. Hunter's appalling cases is that of a vagrant who told him that when a boy he had "for five years made two movements of his hands each second, or 23,760,000 mechanical movements each year." The careless reader naturally infers that the vagrant had become "broken-down, drunken, and diseased" because of the "five years of hell" during which those mechanical movements were performed. But if he will compute the pulsations of his own blood or the number of movements of the hand in a day's clerical work, or in a few hours' practice on the piano, he may think that his sympathy has been obtained by false pretences. Such a book as this stands in deplorable contrast with Mr. Rowntree's study of poverty in York. That study deserves to be taken as a model by philanthropists. The precise statement of the actual condition of the poor is more affecting than volumes of lurid rhetoric.

—The city library of Geneva has just received on deposit a manuscript work by J.-J. Rousseau, entitled 'Institutions Chymiques,' and composed in 1747. It consists of 1,203 beautifully written pages, with few erasures, and is divided into two parts, the second a torso, only a quarter as long as part one. A very interesting account of this unpublished treatise, with extracts that exhibit the literary quality which its author perforce gave to the treatment of every subject in the wide range of his genius, will be found in the *Semaine Littéraire* of Geneva for December 17, 1904, from the pen of M. Théophile Dufour. M. Dufour discovered the precious relic in 1882 in the possession of Mlle. Susanne Nicole, great-granddaughter of Rousseau's trusty friend and correspondent, Paul Moultou; and this lady has

now given it over to public keeping. Like so much of Rousseau's work, it was preceded by a rough draft. There have been elaborate studies of Rousseau as botanist and as musician, but his interest in chemistry has escaped notice, being, indeed, slurred over in the 'Confessions,' to which M. Dufour furnishes an illuminating note on the subject of Baron d'Holbach's employment of Rousseau in 1757 to dress up a "manuscrit de chimie" for him, and to place it with a publisher. Rousseau's dabbling in chemistry began (almost disastrously) at Chambéry in 1737. In 1743 he was attending a course in chemistry under Rouelle, with M. de Francueil, and resumed the study in the following year after the Venetian episode; in 1747 at Chenonceaux he was still occupied with the subject along with literary and musical composition. Ten years later, as we have seen, he was summoned in as a two-fold expert by Baron d'Holbach. In all his wanderings he preserved the unfinished 'Institutions Chymiques,' and bequeathed it with other papers to his literary executor, M. Moultou.

—M. Dufour now looks for the publication of the find, and no doubt it will receive the consideration of the new Société J.-J. Rousseau just getting into working order in Geneva. Over and above its Archives, it contemplates a periodical publication (*Annales*) of memoirs and documents and reviews of new Rousseau literature, and eventually a complete bibliography; an authentic Life, with a critical edition of the 'Confessions'; an exact edition of Rousseau's correspondence and of his works in general. We gladly call attention once more to this interesting enterprise, which invites support from all quarters of the globe. The annual membership fee (which includes subscription to the *Annales*) is twelve francs; life membership a hundred (or not less). The president is Prof. Bernard Bouvier, Bourg-de-Four 10; treasurer, M. Alfred Cartier, place Bel-Air 12. Forms of application with other documents may be had of the secretary, M. Maurice Trembley, Petit-Saconnex, Geneva.

—Recent travellers from Spain report that one of the apparent results of the loss of the Spanish colonial empire to the home country is a widespread commercial and industrial activity, affecting all sections of the country. The new national energy penetrates also the intellectual field, and a significant sign that the movement is not a temporary ebullition is the fact that those who dominate the revival frankly recognize the meaning of the past and the present, and are determined that the nation shall learn and profit by what they teach. It is a fair question whether the scholars of any other European race would care, or dare, on the morrow of national defeat, to begin the publication of material for the study of the history of the colonial domain whose last vestiges had just been wrested from them. Spanish historical students have done much in the past to make accessible the documentary records of their national activities in America and Asia, and those of the present day who are taking up the work give every promise of meeting the demands of contemporary standards as fully as their predecessors met those of a previous century. The first three volumes of the new "Colección de Libros y Documentos referentes á la historia de América," published by Sr. Victoriano Suárez of Madrid, make a most promising beginning. The first contains an account of the Jesuit missions in the Maynas country, at the headwaters of the Amazon, written by P. Francisco de Figueroa. P. Francisco was one of the two missionaries who established the earliest stations in that region, and his narrative, which contains a chapter on the natives, is a useful check on the account by his companion, P. Acuña, on which students have heretofore had to rely for knowledge of their undertaking. The second and third volumes contain two of the five parts of the 'Quinquenarios,' or 'Historia de las Guerras Civiles del Perú,' by Pedro Gutiérrez de Santa Clara, which is edited by Sr. D. Manuel Serrano y Sanz.

—Gutiérrez de Santa Clara appears to have been the son of a Spanish settler who attained a respectable position in Mexico as a public scribe, a vocation which doubtless accounts for the son's literary gifts. Young Pedro, while still a mere boy, went off to try his fortune in the regions where Pizarro was making life in Mexico seem sadly monotonous. He became secretary to Lorenzo de Aldana, one of the conquistadores, who is remembered chiefly because of the foresight and skill with which he anticipated each change in the fortunes of the successive winners in the struggles for the domination of Peru. Aldana knew men and affairs, and he found in Gutiérrez a most competent assistant, who possessed that primary requisite for a successful private secretary, a retentive memory. For his use of this, historical students are under deep obligation to him. Gutiérrez knew intimately the men in every party to which his chief belonged in turn, and he was in a position to understand the significance of all that happened. His contribution, however, does not so much consist in new facts and motives, which were already set forth in the numerous official documents and correspondence previously published. What makes his narrative exceptionally valuable is the intimate personal anecdotes and illuminating descriptions of episodes which become significant when the manner of their happening is made known. When the new exponent of the events of these sorely troubled decades in American annals writes his much-needed history of Peru, he will find Pedro Gutiérrez as useful to-day as he was to Aldana 350 years ago.

ROYCE'S SPENCER.

Herbert Spencer: An Estimate and Review. By Josiah Royce. Together with a Chapter of Personal Reminiscences, by James Collier. Fox, Duffield & Co. 1904.

Exactly one-half this volume is occupied by Professor Royce's estimate of Spencer. Such a review by so very eminent a philosopher of one of his elder contemporaries should be of great and permanent interest. It will not, however, add to its author's reputation. Five different meanings of the term "evolutionist" are given, and yet a very important meaning is omitted—that in which Aristotle was an evolutionist, since he certainly based his central conception on the idea of a plant coming up from seed, or upon something of the sort. Aristotle is represented by Professor Royce as one of the two great anti-evolutionists of Greece, in some sense hard to understand from the few sentences he devotes to this matter. But doubtless many of Professor Royce's readers will agree with Zeller that, from the passages which the latter cites in Aristotle, the continued evolution of higher perfection "erhellt." To some of us it appears to be chiefest of the differences between the historical Aristotle and the imaginary Aristotle of the scholastics that the former makes the form to grow out of the matter, and continually to increase in perfection in the passage through the vegetable and animal kingdoms to man. However, Professor Royce has earned so much credit for accuracy that we cannot doubt that in this difficult matter he has chapter and verse ready for citation.

Having sketched the general history of evolution in bold and strong lines, he reviews the origin and significance of Spencer's own view of evolution. This Englishman's extraordinary innocence regarding every sort of nexus between his own philosophy and that of any remote period or foreign country receives due notice, as well as his failure to regard philosophical thought as itself an evolutionary process in which his own thinking had an organic place. His unemotional, direct, plain, and simple mental build is very well described, and brings up to our minds the picture of a common American balloon-frame house with the conventional gable and ell, with its own reasons for being as it is and not the slightest suspicion of any reason for being otherwise. A great deal of attention is bestowed upon Spencer's invalidism, which is attributed in large part to eye-strain, in accordance with the general theory of Dr. G. M. Gould.

Professor Royce next goes on to give his own restatement of Spencer's principle in these four propositions: (1) that if the parts of any large body are as nearly alike in any specific respect as they then can be, this homogeneity will be unstable; (2) that the differentiating mass, as it ages, will react by its various structure upon the play of the external forces which impinge upon it; (3) that, as the body slowly integrates, the energies within and about it tend to assume an orderly character; and (4) that "evolution is the consolidation of a mass of matter, attended by a loss of some of the energy that this mass contained; while, as this consolidation takes place, both the matter concerned and the energy which it still retains pass from a state in which there is little firmness of structure, little orderliness of arrangement, little sharpness of contour, and much inner resemblance of part and part, to a state in which there is great firmness of structure, much orderliness of arrangement, much sharpness of contour, and much inner variety of part and part." Evolution being thus completed, the reverse process of dissolution begins.

Professor Royce passes to a criticism of Spencer in something less than four thousand words, or, say, two pages of the *Nation*. Here we remark the fairness and catholicity which might confidently have been anticipated. He finds Spencer's limitations to be "as obvious as it is unfair to make one's judgment of him dependent upon them." "The real question is, How far did he help people to understand evolution?" He ought not to be condemned because he undertook to conceive of evolution in mechanical terms. "He would

have been false to his just philosophical purpose had he conceived it otherwise."

The Spencerian will derive great comfort from the different attitudes of the idealist and the logical scientist toward his master. The fault which each finds with Spencer is a virtue in the eyes of the other. The latter objects that cosmology, because of its immense variety, cannot possibly be deduced as a consequence of a fixed law, such as that of the "persistence of force," which will not of itself suffice even to explain a steam-engine. To do this the second law of thermodynamics has to be invoked; and this law, as Maxwell first showed and as is now universally acknowledged, merely provides that nothing shall interfere with certain chance distributions; for an intelligent demon opening a door for molecules that happened to be moving with particularly high velocities in one way as well as for those moving with particularly low velocities in the other way, would produce the effect which this "law" denies. It thus has a character opposed to that of ordinary definite laws, since these provide that mere chance is not to have its way. The physicists further object that, so far as Spencer explains any phenomena of nature, he virtually bases his explanation on a principle quite independent of that of the "persistence of force," and, moreover, that many of his deductions are too vague to have any value as explanations, although they may be valuable as general descriptions of the course of nature. On the other hand, they admit that he did well in putting the emphasis he did upon the distinction between *simple* and *compound* evolution; the former describing histories such as that of a planet, and the latter, histories such as that of a plant or of a race of plants. These objections are familiar to all who have any acquaintance with the world of physical research. They are worth recalling, however, because their contrast with the objections of Professor Royce brings out the distinctive character of the idealistic views; and we may presume that Professor Royce intended to mark this contrast. He is very explicit in bracketing the two laws of thermodynamics as of precisely equal rank, the one determining the *quantity*, the other the *direction*, of change, and is equally explicit in praising Spencer for reducing all the transformations of the physical universe to this *single* invariant type. Nor has he one word of fault to find with his deductions as being too vague. A reader who should know no other writing of Royce than this would think him substantially a Spencerian like Youmans; for the only objection he makes is that simple and compound evolution ought not to be described as a *single* process. But the question whether Spencer does as a matter of fact describe them as a single process or as two processes would appear, to the Spencerian and to the physicist alike, to be little more than a question of words.

The third quarter of the volume is given to a criticism by Professor Royce of Spencer's educational theories, which, by the way, have no apparent connection with the doctrine of evolution. They are treated with much greater severity than is that doctrine, and the last paragraph of this part reads as follows: "Let us honor him for what he was. But let us be glad that he is not the trainer of our children."

The volume is brought to a close by some personal reminiscences of Spencer by Mr. James Collier, who was for nine years his secretary, and for ten his amanuensis. It is as good a personal portraiture as any we call to mind; not speaking, of course, of large books. It begins by saying that Spencer was no recluse, and telling where he might often be seen in London. The places mentioned do not include any at which he would be drawn into serious discussions; and though, besides the places mentioned, he could be found, for many years, almost every evening at the Athenæum, upon the committee of which he served, yet he did not join the conversation circle there, but played a certain number of games of billiards and went home to bed. It was only his sworn adherents who could see much of him. It was that vast work which so absorbed him that sometimes, having of his own motion brought about an interview, when the occasion came he found he must not talk. Yet, let an attack be made upon any position he had taken, and instantly upon hearing it read out he would be ready to dictate his reply, for two or three hours, without wishing to make any corrections. On such occasions, his grasp seemed Napoleonic. In short, he had converted himself into an apparatus for performing that one task, and he had no passions or intuitions which in any way deranged his adjustment to that.

That he certainly was a wonderful thinker in his peculiar way appears much more clearly now that his work is done. Mr. Collier says he never read any book of philosophy except Mansell's 'Prolegomena Logica,' and it is a great pity that he ever read that, because it was just that which introduced an element into his 'First Principles' which philosophical students then and always regarded as utterly refuted and out of date, and which did not harmonize with his original work. When one thinks that his 'Psychology' appeared in 1855, five years before Fechner's 'Psychophysik,' and simultaneously with Bain's first book, 'The Senses and the Intellect'—so inferior in originality and value, although it taught us more, because we were better prepared for it—one cannot but rank Spencer very high. He wrote when the ideas of energy were in the air, especially among engineers, with whom he had mingled much. But those conceptions were by no means *répandues*, as they now are. That he had grasped them in his own way, we need not say. His valuation of Darwinism was from the first extraordinarily near to that of biologists of to-day. So it was with his estimate of the nebular hypothesis at a time when the objections to it appeared most redoubtable.

He did his work in his day, but the system of Synthetic Philosophy will never become a classic. It will not be read forever, like Locke's 'Essay concerning Human Understanding,' Berkeley's 'Principles of Human Knowledge,' and Hume's 'Treatise of Human Nature.' In a few years it will have passed into history, along with Cudworth and Ockham—books that one wishes to know about, but to be excused from reading.

RECENT DRAMATIC VERSE.

In "The Sin of David" (Macmillan) Mr. Stephen Phillips has produced a play better calculated to "place" him critically than any of its predecessors. There is certainly nothing in it to furnish any occasion for those critical rhapsodies which, at the publication of "Paolo and Francesca," caused some momentary anxiety to admirers of Sophocles and Shakspere. On the other hand, while the general tone is still of an elegiac wistfulness, rather than of true dramatic unction, "The Sin of David" is, essentially, less of a melodramatic spectacle, more of a tragedy, than either "Herod" or "Ulysses." The chief impression made by it is that it is the product of a moderate poetic faculty guided by an industrious and self-poised intelligence. Nothing could be cleverer than the scheme of setting the old Hebrew story of David, Uriah, and Bathsheba over into the very Israelitish times of the Puritan Commonwealth. David is represented by Sir Hubert Lisle, a commander in the Parliamentary army; Uriah by Col. Mardyke of the same army; Bathsheba by Miriam, his wife, who, for the sake of the poetry, is given a touch of Southern blood and a pretty vein of romantic fantasy. There is no addition to the Scriptural story save in one respect; but structurally that one is important. It is in the first scene of the play, where we have Sir Hubert Lisle condemning to death Lieut. Joyce, one of his officers, for a wrong to a maid. The accused offers no defence save to say:

"Her face was close to me and dimmed the world."

With fine tragic irony, Sir Hubert afterwards urges again and again the same extenuation for his own act.

It is needless here to follow the course of so familiar a fable, or to present any specimens of Mr. Phillips's habitual Tennysonian imagery and cadence. There is, however, one point in the play as its ethical knot is untied that calls for comment on the score of its general significance. In the view of any Puritan moralist, Sir Hubert Lisle has, like David, been guilty of the two tragic sins of murder and adultery. Yet at the end, when, five years after their marriage, Sir Hubert and Miriam are punished by the death of their child, the dramatist is content with this vicarious expiation, and leads us to hope that his married lovers, chastened by grief, will continue to live happily together. Read in the closet, this conclusion is moving and purging to the passions, leaving us in that sitnation, "durch Mitleid wissend," that is so agreeable to our modern mood. Yet on the stage, coming as it does after the execution of Lieut. Joyce for a less subtle but no more mortal sin, we fear that the effect of this conclusion will be that of a rather cynical morality. It is, of course, open to Mr. Phillips or to anyone to contend that this morality is less cynical than that of the source in Samuel, where we are told that David, after the absolving death of his love-child, "comforted Bathsheba, his wife, . . . and she bare a son, and he called his name Solomon, and the Lord loved him." Yet neither Sophocles nor Shakspere, we think, to whom Mr. Phillips has been so often and so foolishly likened, would have let either the Psalmist or Sir Hubert Lisle off without the old tragic penalty—his death or the woman's. Even Haw-

thorne, in his more complacent century, would have inflicted a spiritual penalty that would have left the reader no flattering unction. We are, however, not considering Mr. Phillips as a moralist, but as a playwright. The point is this: while the more beneficent moral order hypothecated by Mr. Phillips is doubtless quite in accord with the general trend of modern opinion, its softer expiation does tend to deprive the play of a due tragic intensity.

With a startling, but sincerely conceived, dedication to the memory of the founder of the Christian religion, followed by a motto from Lucretius consisting of the familiar passage beginning,

"Humana ante oculos fœde cum vita jaceret,"

Mr. George Cabot Lodge's "Cain" (Houghton, Mifflin & Co.) puts the case of the first free-thinker very strikingly. Mr. Lodge, unlike most writers who have handled Cain's story, has not attempted to humanize it by the introduction of secondary characters—Adah, Cain's child, and the like. His only dramatic persons are Adam, Eve, Cain, Abel, and the Voice of God. With the exception of the rejection of Cain's sacrifice, and the ensuing murder of Abel, there is practically no action in the piece. It is, in short, a "philosophic poem" on the thesis that the man who most unflinchingly thinks his own thoughts, who is most the captain of his soul, is the greatest friend to man. A philosophic drama is not likely, save in the hands of a master, to be of the first poetic attractiveness, and Mr. Lodge's volume furnishes no exception. His mastery of poetic structure is still imperfect; his drama would have gained materially in power by the more careful condensation of a wordy and, in part, adventitious first act. There is, nevertheless, poetry in his imagery, and passion in his speech; witness these lines of Cain's:

"God is not Lord
Of slaves nor tyrant pleased with abject fears,
Pæans and sacrifice: God sheds his grace
And shares his fellowship for men, not slaves!
Men who are sinewed with sublime resolve,
Whom perfect faith has made insatiable,
Whose eyes pursue, star over star, the last
Outpost of knowledge in the skies of thought!
Pilgrims of pathless lands, whom neither walls
Nor slumber nor the arms of love can hold;
Mariners who depart on shoreless seas
Avid of new horizons in the vast
Unknown!—O men, homeless and lonely men,
For you, for you the fellowship of God!

Mr. Lodge makes many good lines in this vein; but they are so rarely combined in concerted harmony that the whole effect of his versification, when it is not ejaculatory, is hard. Yet, when all due abatement has been made, "Cain" is a book of interesting promise. It is the kind of thing every poet needs to write once in his life, for the sake of giving his soul the loose; and there is here, moreover, in both substance and form, much to reward attention.

Mr. Lodge would have done well to ponder deeply that pregnant entry in one of Coleridge's note-books, "Item, that dramatic poetry must be poetry hid in thought and passion, not thought or passion disguised as poetry"; and a perusal of Mr. Maurice V. Samuels's "The Florentines" (Brentano's) and Dr. Richard Garnett's "William Shakespeare" (John Lane) shows that these authors might well have done the same. Mr. Samuels's play, which deals in verse with certain episodes in the life of Cellini, has well-individualized characters, and plot complications of considerable interest, but in true dramatic effect, as well as in poetic suggestion, is defective. While Dr. Garnett's play is equally open to the charge of being a subject dressed in poetry, rather than poetry incarnate in a fit subject, it is a remarkably readable and pleasant little book. It is really a whimsical excursion in Elizabethan scholarship and Shaksperean biography, in which ample learning is combined with a subtle humor and an excellent faculty for blank verse. The play deals wholly with Shakspere as "pedagogue and poacher." The picture of the young poet as the idol of the scholars in his rustic school; the husband of a vixen, finding solace in shooting Sir Thomas Lucy's deer, and in being the Platonic friend of Sir Thomas Lucy's wife, is at least suggestive. Yet to most scholarly readers the skilful speeches which Dr. Garnett has given to Shakspere, foreshadowing the direction of his future greatness, will be second in interest to the admirably fantastic euphuism of Sir Thomas Lucy. There is nothing in the book better than this speech, in which Sir Thomas inquires of Moles, a huntsman, "what bane his board of venison bereaves":

Know, rude forester,
There's something rotten in the state of Charlcote.
Sound stands the mansion still, 'tis true. . . .
But where the sylvan people? Where the troops
Of stag and doe and delicate fawn that erst
Did gambol in these groves? And, consequently,
Where be the haunch and pasty? Smoked these still
Upon the board 'twere somewhat, but the board
Is emptier than the forest avenue,
Where still a remnant lingers, which dislodged,
All should be dire depopulation.
Whence in the name of Zernebock, this nuisance!
Storms the Wild Huntsman with his swarthy pack
Along my woodland alleys? Do the hounds
That erst with horrid fangs Actæon tore
Seek in these shades a quadrupedal prey?
Say, doth the broom-bestriding sorceress,
Companioned with foul incubi, entwine
Her skinny arms round the reluctant deer,
And drag it to her Sabbath and her Satan?
Or twangs the bow and speeds the silver shaft
Of the Queen-Huntress? Hast thou e'er beheld
A covert-breaking stag impetuous
Burst from the brake, and scour adown the glade
Followed by a giant's shadow with a spear?
[*Moles* scratches his head.

Lady Lucy.
Truly, Sir Thomas, you have dazed the man,
Crushing with flowery opulence of phrase
His weak intelligence, as she of Naxos
Perished 'neath garlands heaped to honour her.

This is the very speech of those precious days.

The same Coleridgean touchstone discovers true dramatic gold in neither Mr. G. Constant Lounsbery's "Delilah" (Scott-Thaw Co.) nor Mr. Lewis A. Storr's "A Tragedy of Saul" (G. W. Dillingham). Both are intelligent essays in the field of Biblical drama, but Mr. Storr's play, despite a certain picturesqueness of both diction and situation, fails in dramatic art because of a late Elizabethan manner that sits not quite harmoniously upon the Scriptural subject, and leaves one in a constant irritation of adjustment. There is poetry in some speeches of Mr. Lounsbery's dramatic rehabilitation of "Delilah," but as a drama it is ineffective, partly, no doubt, because there is already one incomparable English tragedy upon the major theme, but partly, at least, because of a certain lack of solidity in dramatic structure.

In Mr. Aldrich's "Judith of Bethulia" (Houghton, Mifflin & Co.) we come again to true dramatic poetry. Mr. Aldrich's specific affair in this volume was one of playmaking. The poetic vitality for the piece was already given in the music and color with which Mr. Aldrich years ago invested the old tale of Judith and Holofernes in his admirable narrative poem of that name. Much of the old material and many of the lines have been taken over into the dramatization without change, and he has drawn somewhat upon his other work, including, for example, that memorable lyric beginning,

"O cease, sweet music, let us rest!
Too soon the hateful day is born."

But the present piece is something more than a making over of the old purple. It is, indeed, likely to prove Mr. Aldrich's more permanent rendering of the story. He has fulfilled it here with even more of that subtle Oriental atmosphere of which he early learned the spell, and he has set it forth in strong and musical dramatic verse. How satisfying to the imagination and the ear is the accent of lines like these:

"This woman's voice falls sweeter on my ear
Than the soft laughter of the Assyrian girls
In the bazaars, or when in the cool night,
After the sultry heat of the long day,
They sit beside the fountain with their lutes."

And this is but a fair specimen of the texture of the play.

Mr. Aldrich's mastery of poetic atmosphere is so easy, his metrical gift so constant, that he accomplishes a feat difficult for most writers of modern poetic drama, and weaves his melody and color around speeches of mere theatric necessity, and even around broken lines of swift dialogue. Nor is the play altogether "thought and passion disguised in the dress of poetry." Poetry is really "hid" in the passionate patriotic impulse of Judith, in the keen dramatic clash at the climax between Judith's purpose to save Bethulia by the death of Holofernes, and the sudden stir of temperament towards his pagan beauty that Mr. Aldrich with a nice instinct gives to her at the supreme tragic moment. Throughout the play there is a skill in dramatic preparation for cumulative effect that is very notable; this makes the more remarkable a certain slackening of dramatic grasp to be felt in the brief fourth act, wherewith the play concludes. The highest point of the play is the death of Holofernes at the end of the third act. It seems to us, speaking objectively, that the play would have ended most effectively here, with perhaps a few lines to hint that the saving of Bethulia will be accomplished by Judith's deed, so to bring us back to the dominant of life with the exaltation of the tragic mood still upon us. Instead of this, we have a rather theatrical fourth act. The rout of Holofernes's army after his death is described excellently, but we think unnecessarily for the purposes of the drama; and then we have Judith, with her high mission accomplished, renouncing the world and human affection, and going veiled to a life of solitude and silence. To the attentive reader who recalls here that sudden moment of passionate spiritual struggle over the sleeping form of King Holofernes, there is a fine poetic rightness in this conclusion, and it doubtless helps the play as a spectacle; but its purely dramatic effectiveness is not so clear.

HENRY JAMES'S GOLDEN BOWL.

The Golden Bowl. By Henry James. Charles Scribner's Sons. 1904.

The story contained in the two volumes entitled 'The Golden Bowl' is elaborately concealed. It is involved, swathed, smothered in many obscurities, obscurities inseparable from the author's method of presenting an inside and outside and all-round view; obscurities arising from excessive use of extended metaphor, from saying too much and saying too little, even from sentences too complex and too elliptical, too long and too short. To get the story you must pay the price, must attack and overcome the obscurities; and whether this be done in a spirit of happy satisfaction of delight in the obscurities for their own sake, or of irritation, or of mere plodding determination to stick and pull through, in the end you have your reward—a story, a situation, which, as you think about it, pierces the obscurities and strikes you in the eyes, like the low red autumn sun pushing out of a mass of black clouds.

It is a short story and bitter. No one except Mr. James could tell it in English without grossness or vulgarity, without challenging our prejudices and prepossessions, without making us all out to be, in his estimation, no better than the French—a state of things we should hate to have forced upon our notice. And he doesn't literally tell the story; he only examines witnesses, comments on testimony, infers and speculates prodigiously, leaving us free to make what we can of the case, to grasp or miss its facts and its wide significance, according to our capacity for independent mental operations. To rehearse the facts is perhaps the most useful part that a reviewer can play between Mr. James and the public. Such preliminary knowledge doesn't impair interest which really lies in beating the bush with the author, sharing breathless moments when it seems that the game is about to break for the open, and long periods of doubt whether it hasn't, after all, tucked itself up and gone to sleep in perfect security. The facts at the bottom of 'The Golden Bowl' glare when you have found them.

Mr. Verver, a person so rich that his nationality may be taken for granted, buys for his daughter Maggie a husband, a Roman Prince, with whom she has fallen in love because he is beautiful and charming and because the history of his ancestors' follies and crimes is recorded in many volumes neatly ranged on a shelf in the British Museum. The Prince assumes responsibilities in good faith. He means to use the Verver money as his own, to be an agreeable husband, and perhaps, according to his subdued lights, a faithful one. Just before the marriage, appears in London Miss Charlotte Stant, a dear friend of Maggie's, an old love of the Prince's, a lady of great beauty, courage, and resource. She has left her own vast and uninteresting continent and crossed the Atlantic ostensibly to buy a wedding present for Maggie. Her real purpose is more sinister. The Prince, bound to secrecy, is obliged to assist in the hunt for a present, and when an apparently suitable one, a golden bowl, is found, it appears that the offering is intended for him, not for Maggie. The Prince refuses the bowl, making a pretext of a crack and a superstition about cracks. He is, indeed, as adamantine as a Prince may be to a fair woman with a past between them.

Charlotte, baffled, disappears, only to descend two years later upon an ideally happy home consisting of Mr. Verver, the Prince, the Princess and the Principino. The Prince, not yet sated with the sensation of rolling in money, finds the moment opportune for retiring with his Princess to one of his Italian hill places, leaving Charlotte to console Mr. Verver at "Fawns," another of his splendid acquisitions. When Mr. Verver buys Charlotte for a wife, the fat is conspicuously in the fire. At the end of the first volume the Princess wakes from bliss to perceive that her stepmother is also her husband's mistress. The Golden Bowl is sharply cracked, and the spectacle of the second volume is the struggle of all concerned to prevent the crack becoming a fissure so wide and deep that neither love nor cunning may avail to preserve an illusion of soundness.

Essentially a hideous struggle, it is difficult to accept all of Mr. James's embroidery of it in representation. The Prince's behavior is perfectly in character. As soon as he knows his wife's suspicions, he is on the defence. He initiates nothing; he waits for tips. He emphatically means in the last resort to abandon nothing for Charlotte, to "stay bought." He has, by nature, handed down through generations as surely as his title and his manners, a familiarity with unspeakable situations, a facility for handling them with what his wife called high decency. The phrase sounds his deepest moral note. Experience of life's shady ways has fitted Charlotte to play pretty well up to her noble partner; and when, in an agony of conscious loss, she shifts the burden of wrong from herself to the Princess, she really earns the epithet "splendid" so lavishly bestowed on her. In the prolonged game of bluff, it is the unsophisticated Ververs who strike us as inhumanly deep. Why, if Mr. Verver could suspect, should he have let things go so far? How, if he had not suspected long and shrewdly, could he have solved the situation by carrying Charlotte off to America, meaning that she should stay there eternally—a proceeding equivalent to declaring: "I know all about this rotten business. I've been waiting to see what my daughter really wants. She wants to have her Prince at any price. She shall have him. Trust me now to keep Charlotte muzzled."

There is a Mrs. Assingham who flits about the Verver establishments, always in the thick of things, useful in explaining to the Prince the strange race with which he has allied himself; useful also to the reader as a fairly correct indicator of the true state of affairs. She is very positive that Maggie knows no evil, is of a delicate stuff born not to know evil. Such is the impression of Maggie distinctly made up to the moment of the crisis. It is almost incredible that, suddenly confronted with evil which might have made a hardened sinner scream with a sense of insult and disgust, she could meet it with stoical reticence, set herself to compromise, to minimize, to hush up things with the patience and wariness of a practised diplomatist. The assumed motive is her love for her father; and underneath that, of course, is the personal power of the charming Prince. But recognition of the mutual affection of father and daughter and of their horror of "hurting" each other does not suffice to make us believe either that Verver kept on smiling at the Prince through thick and thin, or that Maggie let Charlotte go off scot free with her head high. It is certain that Maggie meant to keep the Prince, but one is constantly sceptical of her ability to conduct the campaign for possession of his person with such consummate repression of natural instincts. Of course, Verver, at least, was supported through the ordeal by confidence in what his money could do. It had bought the Prince, it had bought Charlotte; why should it not keep the one where Maggie wanted him, beside her in England, and the other where Maggie wanted *her*, beside him, Verver, wandering vaguely in America, yet held in leash?

The appalling power for moral disintegration, if not corruption, implied in the possession of immense wealth could hardly be more impressively illustrated than it is in 'The Golden Bowl.' Lest any reader should miss the persistent undercurrent, we quote a passage near the end. The Ververs have come to take formal farewell of the Prince and Princess. Father and daughter are looking about the drawing-room at the beautiful things which their money had bought:

"Their eyes moved together from piece to piece, taking in the whole nobleness—quite as if for him to measure the wisdom of old ideas. The two noble persons seated in conversation at tea fell thus into the splendid effect and the general harmony; Mrs. Verver and the Prince fairly 'placed' themselves, however unwittingly, as high expressions of the kind of human furniture required æsthetically by such a scene. The fusion of their presence with the decorative elements, their contribution to the triumph of selection, was complete and admirable; though to a lingering view, a view more penetrating than the occasion really demanded, they also might have figured as a concrete attestation of the rare power of purchase. There was much, indeed, in the tone in which Adam Verner spoke again, and who shall say where his thought stopped? 'Le compte y est.' You've got some good things."

THE WAR IN THE EAST.

The Russo-Japanese War from the Outbreak of Hostilities to the Battle of Liaoyang. With illustrations, maps and plans. By Thomas Cowen. London: Edward Arnold; New York: Longmans. 1904.

A very few years ago an inquirer on the spot was told that the Japanese are excellent copyists, but that they have neither the analytical nor the constructive mind. In illustration he was referred to a display in Yokohama of modern machinery built from foreign models, among which was a Corliss engine with a facsimile brass nameplate of the Rhode Island firm. This had been regarded as essential to the integrity of the copy, although appearing not to carry a meaning to the artisan or the exhibitor. He was further told that the notebooks of commissioners returning from abroad were crammed with facts—were bales of legal decisions, for example, gathered indiscriminately from the courts of England, France and Germany, without appreciation of the underlying principles. Extra-territoriality was about to cease, and this material was for jurists whose authority would soon embrace the foreign resi-

dent as well as the native subject. But with no foundation in the principles of jurisprudence there applied, it would appear that the judiciary might be quite at sea when a case should come up differing from those reported, so that a ready-made decision could not be found to fit it. There was an inference that among the public institutions galvanized into European aspect the army and navy would probably be excellent imitations of German troops and English fleets, but that in active service they might be expected to fail in initiative or upon sudden dilemma—this, notwithstanding their work in the war with China, for, forsooth, was not that enemy Chinese, and do not the various "Maru" lines still sail under white masters?

Plainly this view must be revised. The clear recognition by Japan of the approaching shadow and of the reality behind the shadow shows prescient statesmanship. The war now waging is not the desperate defiance of a pack at bay, a struggle against a higher power by a race of arrested development. It is the logical outcome of a well-matured scheme for national action when the inevitable should arrive. Victorious in 1894, Japan was compelled by intervening European Powers to restore Port Arthur to China, and the way for Russian acquisition was made easy by the troubles, possibly fostered from without, which soon involved the Pekin Government. Russia obtained special transportation facilities and "leased" the fortress. The railway V from the apex at Harbin embraced the Mantchurian littoral, that yielded a free outlet on the Pacific; and, granting fleets as antennæ, one may easily imagine these diverging lines to be arms, reaching out toward Japan after absorbing Korea. When prolonged negotiations were abruptly broken off by the brusque refusal of Russia to discuss her occupation of Mantchuria and her insistence on a modification of Japan's position as to Korea, friendly relations gave way to war, and the action of Japan replaced the promises of Russia. Within a half-week from the day De Rosen received his passports, all the Russian ships were localized, a good portion of them were disabled, many valuable prizes had been taken, the Japan Sea had become such in fact as well as in name, the Yellow Sea was Japanese yellow, and a landing had been effected in Korea. This disturbance in the *status quo* measures the difference between inertness and activity, between self-confidence with procrastination and preparation with execution.

With a Dewey-like appreciation of the value of initiative, the main Japanese fleet sailed on the day the diplomatic thread snapped, and rendezvoused at Elliott Islands two days later. That night the torpedo boats made two successive dashes into the outer harbor of Port Arthur, sixty-five miles away, and disabled three great ships, and the next morning the fleet crippled four more. In all, seven men-of-war, besides two cruisers at Chemulpo, were out of the fight at once. Of the presence of Russian officers at the festivities in the town on the night of surprise, much has been made as a sign of unreadiness. Russian ships are notoriously overmanned, and it is probable that they have a proportionate complement of officers. But, whether so or not, there are always on board ship (our own navy at this time being a possible exception) officers in excess of the immediate need of the vessel in peace, certainly while in port, and a certain number may properly be absent for the day. No blame should attach to the abstract fact of attendance at a ball; nor is it at all likely that there were left "on board each ship only two or three juniors" (p. 89), nor that, when the torpedo attack began, "in the absence of a captain, a lieutenant had to give orders in one breath to a dozen subordinates" (p. 84). The real error, as proved after the event, was not taking into account this startling Japanese dash, this most un-Asiatic promptness of onset. It was a trifling matter that supernumerary officers, or indeed a good proportion of every commissioned grade and of the ships' people as well, were off duty. The fatal error was that those afloat had no thought of an attack. Apparently the ships were not prepared for the action that it would have been safer to anticipate might be offered; no nets were down, no patrols were out, and heavy anchors deep in the mud were slowly to be hoisted before way could be made.

The Russian fleet had little excuse to be where it was. Admiral Starck should have been at sea, looking for Togo and driving the commercial marine of the enemy to cover. The fortress might safely be left to take care of itself, certainly for the time. In fact, the object of the port was to care for the fleet, not that of the fleet to protect the fort. Booms, searchlights, and observation mines should make the inner harbor safe from a raid, and between its plunging fire from the seaward hills and the straight-away cannonade from the water-batteries at their base, the stronghold should withstand any sea attack. At that juncture the Russian fleet had no business to be inshore. The delay itself was the offence; its cause was immaterial. It would have been just as fatal at that late day to be adjusting compasses, to be awaiting orders, or to be stowing away shot, as to be assisting at balls. Mr. Cowen has graphically reconstructed the sentiment and action of those daring and skilful operations whereby the Russian squadron was crippled into impotence, and he brings vividly before his reader the dauntless spirit which, in the presence of danger, aureoles the Japanese seaman quite as well as his brother-in-arms ashore. In the discussion of incidents Mr. Cowen attributes the loss of the *Hatsuse*, ten or twelve miles off Port Arthur, to mines deliberately set adrift, and truly suggests that there is no knowing where they may ultimately be arrested. Their life is of "months or years, and meanwhile these terrible explosive machines are a danger to all [sea-going] humanity" (p. 178).

The crossing of the Yalu, the first serious land encounter, is reckoned a decisive action, not from the numbers engaged, but from its lessons: (1) the Japanese, not the Russians, determined its nature; (2) the Russians were shown to be weak, presumably all along the line, and their knowledge of the country and their outpost work to be poor; (3) the Russians were demonstrated sluggish in mind and body and unstable of purpose, as compared with the alertness, vigor, and tenacity of their adversaries; (4) Russia realized that Japan could and would fight; and (5) the Japanese satisfied themselves that the white man could be driven. All that was a good deal to learn. Incidentally, Gen. Sassulitch was badly beaten and lost much military spoil.

Vigorous fighting is only one element of successful war. Organization will not replace courage, but it always leads towards, if not actually to, success; and, from the first, Japanese organization has been assigned a high place. Its working details are not yet known, but if Mr. Cowen's information is correct, there are several points of interest. On a transport there is assigned to each company in a regiment "a complete supply of everything required, and each company has to look after itself and its own goods," which proved an admirable arrangement that ran like clockwork (p. 283). This would appear to require a special system of moderate-sized containers for convenient and rapid handling, and perhaps a company retinue of camp-followers; for the ordinary soldier cannot simultaneously arrange a section of the company supplies and also bear a rifle in the ranks. There must be general depots, but observing correspondents have more than once noted that all the troops have abundant immediate material on their own transports. This means that independent and distinct storeships, liable to stray away or be lost, are not entrusted with regimental equipage, so that a regiment cannot be separated from its own reserve of clothing, subsistence, or ammunition. Another point is that, immediately upon landing, the various administrative sites are staked out and inscribed, and the bearers of labelled packages of medical, subsistence, ordnance, and the different varieties of other stores, go without inquiry or delay to the marked sites. Mr. Cowen's illustration is of the landing at Pitsuwo, to this effect: The hostile outpost having been brushed away by gunboat fire very early in the morning, the troops were signalled at 7:40 A. M., and waded half a mile, when they set to work establishing a pier of boats 1,000 feet long, with a 12-foot way, "and by noon some 2,500 men fully equipped for immediate action, and several hundred tons of cargo [all in appropriate divisions for handling and issue], were installed on the beach and the hill, with a half-finished wharf carrying on a busy traffic." His comment is: "When the Americans landed at Iloilo in 1899, they took four days to do less than this, and the enemy made damaging use of the time" (p. 285). Fortunately, he draws no comparison between Tampa and the embarkations in the ports of Dai Nippon. Our Quartermaster's Department does not appear to have a representative anywhere along their lines. Conditions may differ, but principles are to be studied, and if these "yellow hornets" have acquired a new principle, we should learn it.

Port Arthur is on the extremity of the Liaotung peninsula, down whose backbone runs the spinal cord of the railroad from Mukden. To cut that cord and paralyze the communications of the fortress was the invaders' first serious object. Immediately upon Kuroki's forcing the Yalu, Gen. Oku landed on the shore of Korea Bay, and advanced to the road, about twenty miles away. Upon this, after several days' desultory fighting, he planted himself, and then moved upon the fortified works of Kinchow (better, but somewhat tautologically, recognized as Nanshan Hill, for *shan* means

mountain), which stretched from water to water, or four miles across. This was captured after an all-day's assault following a week of skirmishing, "and it established even more conclusively than the Yalu battle that the Japanese soldiers can claim full equality, not merely with some Europeans, but with the best Europe has to show" (p. 298). In front of the two fortified heights which they carried were elaborate barbed-wire entanglements, between these were buried mines, and the trenches had iron roofing with minute loopholes for rifles. On the crests were ten or twelve separate and supporting works, in which sixty guns were mounted.

"Little by little, the Japanese forced their way up the steep face. . . . A half-dozen men would volunteer to reach the barbed wire and cut it; two only would get there and those would be killed, but not before they had cut the wire. Another half-dozen would immediately offer for the next bit of work, and with the same result. Others pressed on to dig up a few feet of earth as cover; a man could not outlive more than a score of strokes with pick or shovel, and then he would fall; but his work lived and served its purpose; his comrades stepped over his body and were so much nearer the goal" (p. 297).

At Nanshan, again, there was a capture of much artillery—this time sixty-eight field guns and ten Maxims, although the Russians sought to minimize its importance because the pieces had chiefly been taken from the Chinese in 1900. It was true that some of these had been Chinese, but it was also true that they were of the latest and best types, many Krupps and Maxims of high degree. On this general subject Mr. Cowen appears to err in believing that the Japanese had the superior guns. The gunners were better, but the guns themselves were outclassed by the Russians', the failure of whose missiles to carry their full range was either from inferior ammunition or from unskilful gunnery, or from both. But, as the campaign went on, the islanders helped themselves pretty liberally to the continental supply, acquiring, for instance, fourteen excellent quick-firers three weeks later at Telissu.

The record ceases with the nine days' battle of Liaoyang, where Kuropatkin hoped to toll Oyama from the hills to the plains to meet his 200,000 men, and where Oyama proposed to close behind his foe, as tongs might beyond the flaming end of a brand, and cut the railway to the north. Neither was entirely successful, for the Russians, leaving behind enormous booty, escaped before the enveloping columns grasped the rails. The casualties aggregated 40,000; those of the Russians being somewhat the larger. But it was the end of the southern advance for the campaign, and both armies deadlocked before Mukden.

Reasonable limits forbid the discussion here of principles, nor is there space for many more details. Mr. Cowen's narrative presents numerous excellent illustrations, some from photographs within both lines, and some drawings of much spirit, evidently by a native artist. One gleans from these that knapsacks were worn on marches, and blanket rolls carried under fire; that an unusually large proportion of the Cossack horses are white—a color that draws fire and is especially ill-adapted for scouting service, and that the hooded stirrup is not used; that the Russians, like the English and probably European infantry generally, wear nothing between their trousers and their legs, unlike the more comfortable usage of United States troops; and from these and from the text we know that really heavy guns are being used on a larger scale than ever before in mobile warfare. One other condition must be noted. Notwithstanding the intense racial patriotism that prevails, the occasional black sheep, to use the conventional ovine slander, is willing to disclose the people's secrets. According to the author, about a dozen of these have been discovered, some at least converts to the Holy Orthodox Church (p. 206). It raises the question whether Christianity in any of its forms, dethroning the Mikado from the exalted spiritual position that he enjoys, may not ultimately weaken the fierce loyalty that so readily sacrifices family ties and life itself at his behest? May not the abandonment of the old faith disintegrate that plexus of emotions which now makes these warriors rivals of the fanatical dervishes of the Sudan? When the Roman converts were destroyed in the seventeenth century, because tampering with politics on their part was discovered or suspected, might there not have been prophetic fear for the stability of the throne? Will the Christian Japanese respond as recklessly, not merely to the call to arms, but to the self-abnegation that now goes with it?

Wellington, Soldier and Statesman, and the Revival of the Military Power of England. By William O'Connor Morris. G. P. Putnam's Sons, 1904.

This is the most recent volume of the "Heroes of the Nations" series, and the last work of the late Judge Morris, who died soon after reading the proofs of it. The title is well chosen, for the book is in no sense a biography of Wellington, but almost entirely a military history. The Peninsular War forms, as it were, the kernel, and to it more than one-half of the three hundred and ninety pages (part of the third and the whole of chapters four to eight) are devoted. This is natural, for Judge Morris held that war to be Wellington's great achievement, and that he was the principal author of the ultimate issue by which the allies reached Paris for the first time. But Wellington's early career is not neglected. The promise of his youth, when he was a company and regimental officer, is well indicated in the first chapter, and in the second the seven years spent in India are so treated as to show that, while he there proved himself to be a real general, his civil administration was even more deserving of praise. The ninth chapter deals with the campaign of 1815 in fifty pages, wherein it is concluded that the Duke's conduct of the actual battle of Waterloo, in which he showed himself master of the art of tactics and a consummate leader of men once engaged, was a legitimate set-off to errors in strategy and to his being outmanœuvred earlier in the campaign, although this last is in part attributed to Blücher, who certainly forced his hand, and but for whose impetuosity Wellington would probably have acted quite differently. The remainder of the book, on the Duke's political life, is not so detailed, and is really too brief to be interesting or of much value to one who has not already a considerable acquaintance with the subject, while to those who are so acquainted, it has nothing new to offer.

The great characteristics of the man are fully but not too partially recognized: his farseeing wisdom, well-balanced judgment, and moderation on the intellectual side; and, on the moral side, his sterling integrity and strong sense of duty, which made it "well for the world that it possessed such a man." On the other hand, his coldness, the fact that his officers and soldiers respected but did not love him, that in private life he stood aloof and was lonely, that in political life he was slow to recognize the manifold changes which the spirit of the age demanded (though he seldom resisted to the end measures that he foresaw were required), and that he was a typical representative of "the Protestant *noblesse* of Ireland, an exclusive oligarchy of race and creed"—all these points are well brought out. Only one trait of his character goes unremarked, but this was prominent: his love of the truth, from which nothing could make him swerve.

As for Wellington's place as a general, we have already indicated how Judge Morris ranks him: as a master of tactics, but by no means a master of strategy; not a military genius of the first rank, but capable of military conceptions of the very highest merit (as exemplified in his general plan for the defence of Portugal and in particular by the lines of Torres Vedras). No man seems to have understood so well the inherent defects of the French army and how it could be resisted and beaten in the field. On the whole, "he was superior to every other chief of the League of Europe in the Revolutionary and Napoleonic Wars; this, I am convinced, will be his place in history." Here is the Judge's final verdict, and eminently sane it is. But when he speaks with reprehension, as he does over and over again, of Wellington's over-cautiousness after a victory, he seems not to remember that the Duke had learned by experience how dangerous it was to allow a victorious British army to get out of hand, and not to realize how vast was the difference in results between a defeat of the only British force in the field and a defeat of some one of the armies of Napoleon. Herein Judge Morris fails to give Wellington credit for that sagacity which elsewhere he is quick to see.

As a writer, though often picturesque enough, Judge Morris had a habit which becomes very tiresome to the reader—the breaking up of a sentence into short clauses separated by semicolons. The usually overworked comma has but a small part to play in this book, and the result is often too much like a series of gaspings for breath. Whether the author selected the illustrations, we do not know. There are sixteen portraits of the principal personages, and sixteen maps and plans. The Judge had views about the extant portraits, and remarks that they are not very good. It is therefore surprising to find as the frontispiece that one which the Duke's intimate friend Ellesmere stigmatized as one of the worst. The map to illustrate the Peninsular War is insufficient in details, and on too small a scale to be of much service. But on the whole, those who like a résumé of a period will find in this book more than a good example of its kind.

Verrocchio. By Maud Cruttwell. London: Duckworth & Co.; New York: Charles Scribner's Sons.

To write a book on Verrocchio argues at least a hopeful spirit. He is the great enigma of the Florentine renaissance. The wide orbit of his influence is the storm-centre of modern connoisseurship. From the time when Morelli excoriated Bode for seeing Verrocchio in everything, to the last skeptic who resolves the great *chef d'atelier* into a myth, the battle has variously moved. Mr. Berenson, whose fault is rarely lack of dogmatism, still keeps four interrogation points against the eight paintings he concedes to Leonardo's master; Herr von Beckerath, in the *Burlington Magazine* for December last, reproaches Mr. Berenson for distrust of a group of drawings of the school. Where men have so signally fallen out, it is meet, perhaps, that the eirenicon should come from a woman, and Maud Cruttwell brings persuasive credentials for her surely audacious task. Her recent volume on the Della Robbia was distinguished by conscientious exploration of the widely scattered material, uncommon insight into sculptural style, and above all by excellent good judgment.

These qualities have dictated the time of her approach to the more difficult problem. Indeed, a revised appreciation of Verrocchio could hardly be more timely than at present. Only a year or two ago Count Gamba and Dr. von Fabriczy discovered at Careggi the beautiful little terracotta that gives the clue to Verrocchio's origins, and about the same date were found the documents that accredited the Enthroned Madonna in the Pistoia cathedral as a late work of his hand. To these and other recent contributions of his *œuvre* our author adds the famous head of a horse which, traditionally a work of Donatello, passed from the Carafa family to the Naples Museum as an antique. Maud Cruttwell reclaims it for Verrocchio by the following plausible if not compelling argument: This splendid head was given by Lorenzo dei Medici to Diomede Carafa in 1471, eight years before Verrocchio undertook the Colleoni statue. It strikingly resembles the head of the horse at Venice; both are free and greatly improved copies of an antique formerly in the Medici collections and now in the Museo Archeologico at Florence. Donatello had previously copied this head in a more literal and less skilful way for the Gattamelata at Padua. Since the versions at Naples and Venice show precisely the same kind of revision, it is assumed that they are by the same hand. But the conclusion hardly seems to us axiomatic. The Naples sculpture has a severity of line that really takes it far from the more complicated modelling of Colleoni's steed. It is, indeed, more archaic in feeling than its Roman original. All this points to Donatello. Furthermore, the Anonimo Magliabecchiano who relates that the Naples head is a fragment of an equestrian statue which Donatello was to make of Alfonso of Aragon, may have been romancing, but then he may have set down a current and reliable tradition. Taken broadly, the argument concludes in a Scotch verdict, with the chance, it seems to us, a little in Donatello's favor.

Of the general treatment of Verrocchio's sculpture, little but good is to be said. But discussion of it would take us far afield. The real mystery to be solved is the mass of Verrocchiesque painting and drawing which presumably contains somewhere the authentic work of the master and, fascinating possibility, the beginnings of his pupil, Leonardo da Vinci. Here genuine material is as rare as spurious is common. The starting-point of all criticism of Verrocchio's painting must be his single picture traditionally authenticated, the "Baptism" of the Accademia. As for the dozen panels that Herr Bode cheerfully attributed to Verrocchio, they display at least half a dozen hands. Two of these pictures, the enigmatical "Annunciation" of the Uffizi and the Female Portrait of the Lichtenstein Gallery at Vienna, Maud Cruttwell claims for Verrocchio—making, with the "Baptism," three authentic works in all. The Madonna at Pistoia is put aside, because, as it stands, the work is mostly Lorenzo di Credi's. Unaccountably the "Madonna with the Pink" at Munich is left out of the reckoning, perhaps because of a lingering respect for Morelli's allegation of the inevitable anonymous Fleming. As a matter of fact, there is no reasonable doubt that this admirable little picture is Italian. Intimately connected by its general workmanship, and especially by its landscape background, with the "Baptism" of the Accademia and the "Annunciation" of the Uffizi, by its facial type and modelling with the Lichtenstein portrait, it must stand or fall with the entire group. We are reduced, then, to a very interesting balance of probabilities. If Verrocchio's part was large in the "Baptism," these four pictures are all his and wholly characteristic of him. If, on the other hand, only the design of the "Baptism" is by its accredited author, then we have practically no pictorial data for Verrocchio at all. All four pictures have significant points of resemblance with Leonardo's unfinished "Adoration of the Kings" in the Uffizi. Why are they not his?

Generally speaking, Maud Cruttwell's work is sober and well informed. The pictorial material is almost complete, and very well arranged. All relevant documents are printed in full—one or two for the first time—so that all the author's statements may be readily controlled. One may regret the vagueness of her general views, and a Ruskinian fling at the Dutch small masters in the first chapter, but lapses of taste and of judgment are alike rare. Few comprehensive works of recent years are as useful, and if the Verrocchio problem remains unsolved, at least here is such a convenient survey of all the material as should embolden some more original critic to seek its solution.

History of Andrew Jackson, Pioneer, Patriot, Soldier, Politician, President. By Augustus C. Buell. In two volumes. Charles Scribner's Sons. 1904. Portraits.

Mr. Buell lived to read the proof-sheets of his 'History of Andrew Jackson,' and we are assured that the book is as he wished it to be. This is unfortunate for the literary reputation of an author whose sketch of John Paul Jones showed that he could make good use of historical material. His Jackson is not a history of the man, or of the times; it is not a balanced work in execution, for it gives too much space to the military career; it shows no investigation of manuscript sources, and little reading outside of Parton, whose worst offences Mr. Buell imitates while criticising them severely; it exhibits a singular incapacity to weigh testimony and to judge the contemporaries, whether friends or foes, of the great Tennesseean. Trivialities are introduced where evidence should be given, and an anecdote derived from a garrulous and patently unreliable source takes the place of a judicial statement of conditions and motives. A difficulty is lightly solved by reference to Jackson's veneration for the memory of his wife, and such a solution is given many times where it is as misleading as it is unnecessary. The style is the reporter's, and by liberal use of superlatives is kept at strident pitch. An erroneous impression of Jackson and of all who had dealings with him, from the humble express rider to a rival for the Presidency, is produced. Not a single character picture, not a description of battle or campaign, not a summary of a State paper can be selected as striking or correct. The hero is smothered in expletives and adjectives. The result must be classed with historical fiction, and not very good fiction at that.

The intention of the writer is evident almost from the first chapter—to erect a military hero in whom the barbaric instinct for fighting was uppermost; yet in whom is to be found "an unbroken constancy of ambitious plan and calculation in all his fancied eccentricity." Little study of Jackson's career is required to show that he was a man of action, more controlled by impulse than by reflection. It was the same in civil as in military life, and if his inferiors and supposed enemies suffered from his arbitrary judgments, his superiors were embarrassed by his disregard of form, and his friends were placed on the defensive by his lawless acts. The frontier spirit was strong in him, but it could hardly have shown itself to be based upon such reasonable control as Mr. Buell contends. It is absurd to speak of Jackson's training militia years before the Creek war as an act of "marvellous sagacity, rewarded in the end by transcendent success." The long and detailed account of the campaign against the Creeks only reminds the reader of the great superiority in numbers and equipment of Jackson's forces, and the unnecessary butcheries committed in the unequal contest. The campaign is presented as an almost unbroken series of victories, although in reality the results were meagre, and the position of Jackson and the Georgia forces at the close of operations was very unsatisfactory.

Even as a military hero, Jackson suffers at the hands of his biographer, mainly through the very loose statements, amounting too often to positive misstatements, of the incidents connected with his campaign. The misleading estimates of the numbers of Indians engaged in the Creek war may be passed over, though they differ widely from the official returns. We take the attack upon Fort Bowyer, as related in chapter xiii., as a fair example of Mr. Buell's methods. Jackson reached Mobile August 16—not September 16, an error which makes sad work of such phrases as "just about this time" or "the day before the arrival of Jackson." The sloop *Hermes* was a vessel of twenty-two, not thirty-two guns, and was set on fire by Percy, not by red-hot shot from the fort. Buell says Percy landed 280 "British soldiers" for the land

attack; but Jackson described the attacking force as an "incongruous horde of Indians and negro assassins," and the British account gave 60 marines and 120 Indians. Buell says the garrison of the fort was composed of 136 "regular artillerymen," but Adams says it was 160 infantry. Buell asserts that from the prisoners taken Jackson learned that the expedition had been fitted out in Pensacola. Yet Jackson knew this in August, more than two weeks before the expedition sailed. Buell makes the British killed and wounded 240; but the two vessels gave 31 killed and 40 wounded, thus leaving 169 casualties to be supplied from the land force, which is inconceivable.

It would be a fruitless task to follow Mr. Buell in his many errors of statement, for no chapter is free from them. Nor would it be more profitable to show how unfortunate the attempt to emphasize Jackson's military character works when applied to his civil and private life. A reasonable degree of consistency would improve the attempt, but consistency was under the circumstances impossible. The transitions from the cursing, blustering soldier to the courtly and gentle friend are too rapid to be accepted, and leave an impression directly contrary to that which the author intended. For this his treatment of material is responsible. He goes out of his way to italicize the hastily written and unreasonable sentences in Jackson's letters. He interpolates his own remarks in the body of a letter, and by jejune comments produces an anti-climax where he wished to produce a thrill. A study of the first drafts of these letters, existing in the Library of Congress, would have saved Mr. Buell from much of his foolish comment, as well as prevented the use of material long since discarded by the historian. It is astonishing to find the Rhea letter accepted, although that letter never had any existence outside of Rhea's imagination.

The account given of the negotiations at Ghent would be comical but for the evident sincerity of the writer. Yet it is strange to find that the great superstructure of supposition he has raised rests upon a proclamation printed the night before the battle of New Orleans and burned the day after, no copy of it being known to exist! This evidence is supported by an alleged statement made by Mrs. Edward Livingston, which as evidence is not worthy of consideration. Mr. Buell attaches too much importance to Jackson's street harangue during the Burr trial, and claims too great intimacy between the General and Gallatin, for their correspondence does not bear out the claim. Jefferson becomes a milksop because he would not go to war, and Armstrong, who favored Jackson, is unfairly treated. John Quincy Adams is highly praised, but nothing is said of Jackson's treatment of this most able and unselfish defender. For Clay and Calhoun no term of contempt is too strong for Mr. Buell, apparently because they were not "fighters." The Oregon compromise becomes an ignominious surrender, and Jackson's last letter, not "dictated," but by his own hand, is distorted into a message of war. The contests with the Bank and with nullification are related in their superficial aspects, while the Calhoun incident is really not told at all, for the agency of Hamilton in supplying Jackson with the occasion of attack is not even mentioned. Even had these volumes been written half a century ago, they would have been open to severe criticism; in the light of the manuscript resources of to-day they fall far short of what is demanded.

High Living. Recipes from Southern Climes. Compiled by L. L. McLaren. San Francisco: Paul Elder & Co.

French Home Cooking. By Berthe Julienne Low. McClure, Phillips & Co.

Books and My Food. By Elisabeth Luther Cary and Annie M. Jones. New York: Rohde & Haskins.

Near San Francisco is established a philanthropic enterprise called the Telegraph Hill Neighborhood Association. Of necessity it is in perennial need of funds. As one means of making good the deficiency, it has issued in pamphlet form a limited compilation of recipes so captivating that every person looking for preparations of food distinctive, novel, original, and practical will become, first, a willing purchaser of the brochure, and, secondly, an enthusiastic admirer of the rare judgment and discrimination shown in the presentation. What makes the recipes so distinctive is that almost every one is individual, and that they are contributed by members of the large cosmopolitan population of San Francisco, who offer, in a form that has come to each through generations of inheritance, a representative dish of his or her particular nationality, including the Spanish, Mexican, Italian, French, Hawaiian, East Indian, and other schools of cookery. The selection is so admirable that it leaves little or nothing to be desired. The formulas are given in terms so clear that even the novice will be able to approximate in execution to the intention of their contributors, while the finished cook will see in them opportunities rarely presented to add piquant concoctions to the routine of conventional feeding.

No further than the fourth page we find a formula for "pimiento [red pepper] bisque" that shows how completely this compilation is removed from competition. This is more emphasized on the seventh page in a formula called "soft-shell crab as prepared in an Italian monastery." In this, six crabs are placed, while alive, in a bowl containing one pint of milk and three beaten eggs. They are allowed to remain in this bath until they have consumed and digested all of the liquid, when they are rolled in fine bread crumbs and fried in boiling lard. Wherein this recipe is deficient is that it does not state that, after the crabs have digested the liquid, their lungs are to be removed before cooking. By literal adherence to this formula, omitting the precaution suggested, the novice would be neglectful, whereas a trained cook would understand that this was a detail not to be ignored. In two or three instances, we detect that some exile to the Pacific Coast from Eastern parts is a contributor to the compilation. There is a reminiscence of New York in our old, shopworn friend, "Canapé Lorenzo." These lapses, however, are so rare that they are barely noticeable in the stirring, brilliant, and piquant aggregation which includes (taken haphazard) such combinations as "Spanish onion rarebit," "Scrambled eggs Durango," "Devilled chops," "Estofado de Cordero," "Chicken Portuguese," "Pimiento Timbales," "Peppers stuffed with corn," etc.

The preface to Mrs. Low's book will tempt the gastronomic wayfarer to continue his journey, and make frequent halts to study many of the recipes contained within the covers of the volume. The author's purpose is to bring French cooking into harmonious relations with American aliments. What is meant by this is illustrated in the case of sweetbreads. The time indicated by a French formula as necessary for the cooking of these is much longer than is required to cook our kinds, which are considerably smaller; therefore, Mrs. Low adapts the Gallic method of cooking them to the conditions affecting those sold in our markets. This is helpful. Again, in France, green peas are cooked in the steam of lettuce leaves without the addition of water. This is the correct way; but Mrs. Low shows how this is impossible with our peas, because they are picked too old and too large—in fact, are rarely sufficiently tender.

She makes one statement in her preface to which exception may be taken. She says that when she arrived in New York, twenty-four years ago, it was difficult to purchase even so common a thing as parsley or leeks. Had she been writing of Boston —*très bien;* but twenty-four years ago New York had long emerged from the swaddling-clothes of provincial vegetable supply, whether of roots or herbs. Then, again, on page 242 Mrs. Low gives a formula for frying sliced egg-plant, worded as follows: "Cut them in slices and fry them in butter" —nothing more. Slices of egg-plant require preparatory treatment, not indicated in Mrs. Low's recipe, before being dipped in yolk of egg and breadcrumbs and fried in a bath of boiling lard.

Mrs. Low does well to call attention to our elementary methods of presenting food. She alludes especially to the lack of discrimination which permits the serving of vegetables with a béchamel sauce on the same plate with meat and a brown gravy. Mrs. Low also deplores the freezing of fish and meats as destructive of quality. Cold storage, however, has come to remain. Only one who knows the excellence of our meats, fish, game, and poultry, before the advent of this preservative process, can appreciate their deterioration since. Mrs. Low's formulas are in the main so excellent that it would be invidious to discriminate. Her success is unequivocal and decisive. An index a trifle more detailed would make reference more quickly effective.

'Books and My Food' is a culinary compilation in a new form—the combination of a literary quotation and of a recipe for every day of the year. For example, for February 23, we have a recipe for ratafia, crowned by a quotation from George Eliot, while that for February 24 is for a preparation of sardines, preceded by a sentence taken from Thackeray. Apart from eccentricity of form, the book leaves nothing to be desired. Directions for applying the recipes are intelligently given, and judgment and taste in selection are conspicuous.

The Log of the Griffin. By Donald Maxwell. John Lane.

We have here the account of a very original voyage. The author is an artist, who

conceived the idea of building a boat in the Toggenburg, twenty miles from the Lake of Zurich or other navigable water, of having it transported overland to the lake, and of sailing, or drifting, in it down the Limmat and the Rhine, his objective point being Teddington, on the Thames. In one way or another, alone or with a single companion, the strange voyage was accomplished, and its incidents are recorded in the "log" and make capital reading. An Epi-Log informs us of the ultimate fate of the odd craft, which went to the bottom for the third and last time, on August 20, 1903, off the Kentish coast, where fishing it up again was impossible.

The book is agreeably illustrated with drawings, mostly of landscape, by the author, some of them in colors. The figure drawings by another hand are not so good and do not add to the attractiveness of the volume. Among the places Mr. Maxwell saw is Rheinfelden, and it is interesting to compare his pictures of it with those by Turner and Ruskin in the fifth volume of 'Modern Painters.' Whether by accident or design (for he mentions neither Turner nor Ruskin), Mr. Maxwell has given one of his drawings the title chosen by Ruskin for Turner's sketch, "The Nets in the Rapids," while another is a general view from nearly the same point as Ruskin's drawing. The art is very different—an art that shows the intervention of Whistler; but the place seems remarkably little altered. Here are the fish-house and the nets, the bridge, and the towers beyond; apparently even the same roofs. The only notable change is an improvement—a growth of trees on what was the bare river bank. A third sketch shows, from a different point of view, the same tower that Ruskin gives in a drawing he calls "Peace," and there one sees, roughly indicated, the same stork's-nest still on its summit. One would not know what it is but for Ruskin's note. In Rheinfelden, at least, the ancient peace has not been greatly disturbed since Turner's day by the modern spirit of change and "progress," which Ruskin so bitterly hated.

Highways and Byways of the South. Written and illustrated by Clifton Johnson. Macmillan. 1904. Pp. xiv., 362.

In this freely and pertinently illustrated volume, one has an opportunity to form an exceptionally clear idea of the rural life of the South. Starting in near St. Augustine, the well-travelled author wanders through many of the Southern States with an eye to observe everything of interest and a heart in sympathy with the people. We think of Florida as a land of flowers, but, in doing so, fail to take into account the sterility of the soil, which needs fertilizing and irrigating in most places. Grass is almost an unknown feature of a Southern landscape. Instead, one sees dooryards universally of sand, with flower beds divided from the walks by bricks set up on edge, forming a saw-tooth frill to the beds. To a Northern eye it appears strange to see all houses, mansions as well as negro cabins, set well up on stilts. We do not know why this custom should have prevailed in neighborhoods not subject to inundation, but so it is. Most houses, also, are divided in the centre by a wide hall, which generally forms the living room of the family. In the humbler houses, however, this hall is open to the weather, and is really a passageway from one side to the other. Nearly all rooms except the kitchen or cook room are warmed by open fireplaces, which have the virtue of looking cheerful even if the heat which they furnish is small in amount. The walls of most rooms are ceiled instead of plastered, possibly because plastering was likely to crack when the house settled on its stilts. This ceiling turns dark with age, and gives the rooms a gloomy look which they might not otherwise have.

The farming all through the South, except in the cotton region, is carried on in a very primitive way, and because of this the results are usually disappointing. The work in the cotton fields is altogether engrossing, and most of all when it comes to the picking, which occupies the entire autumn. To see whole negro families out, each person with a large bag, which he is slowly filling with the snowy flakes of cotton, suspended from his neck, is most interesting to unaccustomed eyes. The negro, as a rule, works well at this, whether gathering his own crop or that of some stranger who has hired him; and the job is almost entirely in his hands.

The cabins standing by the dozen out in the fields are generally grouped about a little church, the rudest, roughest affair imaginable, sometimes with a straight piece of iron suspended from two posts to serve as a bell. But in the level ground, where the cotton flourishes best, this piece of iron, struck suddenly and sharply after nightfall, can be heard for miles. The negro of to-day enjoys his "meetings" as much as ever, and, no matter what his conduct may be, still derives great comfort from his belief.

Saturday afternoon sees every negro who can possibly get away from his cabin promenading in his best apparel the streets of the nearest town, and spending his money, if he is so fortunate as to have any, recklessly; and, if he does not have any, running up an account with equal recklessness at the "store." There is, however, an increasing number who have learned to save something, and are in a fair way to have homes for themselves. They need never starve, for work is everywhere waiting for them, and they are given the preference over white laborers, against whom there exists a deep prejudice all through the South. The kindly feeling which Mr. Johnson has for most simple rural folk he cherishes in full measure for the "mountain white"—in most cases a pitiable person indeed. The hills he cultivates are steep and stony, and the crops consequently poor, while if they were abundant there is no market for them. The efforts made by these poor people to get a little education are pathetic in the extreme. In describing the last day of a school term, the following touching picture is given: "The children trimmed the schoolroom with greenery, and made a little bower in one corner, and carpeted the floor in that corner with soft moss. On this forest carpet they stood when they said their speeches" (p. 144). The manufacture of illicit whiskey still proceeds, though the "stills" are so well hidden that they are rarely found unless betrayed by the mountaineers themselves. The hospitality of the people is remarkable, and they rarely suffer the stranger to go away hungry, no matter how little they may have themselves, unless he is suspected of being an officer in search of "stills." One likes to dwell upon the picture of these simple homes in which the spinning-wheel is often found in active use, and the main wants of the family are supplied by the labors of the individual members of the household.

John Bunyan. By W. Hale White, author of 'Mark Rutherford,' etc. Illustrated. Charles Scribner's Sons. 1904. Pp. 222.

It was years after the reviewer knew Oxford and Cambridge before, in passing from one to the other, he lingered some midday hours in Bedford and its Bunyania. He was not unmindful of carvings at the city fountain, nor of the roll of pastors in the Bunyan church porch, nor of personal relics, as his mug, chair, staff, and iron-bound prison gate contrasting with the bronze door of Pilgrim reliefs, nor of the isolated tower with the ancient bell, emblem of that tocsin which, when Bunyan pulled, broke out in a peal heard round the world. Wonder was borne in upon the wayfarer that, half-way between the twin eyes of England, her universities, a mechanical of a craft among the basest, and he imprisoned through a dozen of his best years, should write something epoch-making, even in more than one point superior to all masterpieces of Cambridge and Oxford. In the British Museum had been noted 'Pilgrim's Progress' in well-nigh a hundred languages (Dakota, 1875), and with more than a hundred editions in more than one language. So well-thumbed had that book been that no single copy of its *princeps* is now known—no, not in London or Providence, which had each long thought they had one.

The preface to Mr. White's volume is these words: "I am indebted to Dr. Brown's John Bunyan for my knowledge of many facts of Bunyan's life." Only this and nothing more (except some four footnote references) is a curt and cold thank-you-for-nothing from a snapper-up from Brown of much more than facts. Much, also, that is Brown-borrowed, through carelessness or wish to abridge or disguise is so "conveyed" that we miss the meaning or at least the significance. Half-truths thus become what Coleridge calls whole errors. A fourth part of this Bunyan book is occupied with 'Pilgrim's Progress,' which more and more eclipses lesser lights. There is also a fair account of 'Grace Abounding,' the 'Life and Death of Mr. Badman,' 'The Holy War,' etc., as well as of Bunyan's life and characteristics. This newest summary, dating from last October, will be more read than better books by Philip and Brown. It is not so heavy, either, for the purse, or for holding in the hand, or for reading "as one runneth."

'Pilgrim's Progress' was published in 1678, and Bunyan had been released from his second imprisonment six years before. But all his other works were known to have been sent to the press as soon as written. It was hence argued that Bunyan must have been jailed a third time, and not long before 1678, since 'Pilgrim's Progress' is known to have been born behind bars. Local tradition pointed the same way through credible witnesses. Yet this arch of evidence lacked a keystone till July, 1887, when the original warrant for the arrest of Bunyan, issued March 4, 1675 (new

style), was discovered. This longed-for paper came to the hands of Dr. Brown in October, 1888, when his last edition of Bunyan was too far printed for him to show a copy of it except in a prefatory note, in which he welcomed the proof he had long desiderated. The value of this fragment—thirty-four lines picked from the wormholes of long-vanished days—has become palpable, and on April 23, 1904, it changed hands for £305. This transaction, which is the only new important fact we learn from Mr. White, adds a facsimile, apparently the first which has appeared in America, of the warrant itself, its photographic script. But the lustre even of this Kohinoor is somewhat obscured by the biographer's customary carelessness. Nearly half the written words he omits, in writing the warrant, and he modernizes the spelling of not a few he does not omit. His original spells both Bunnyan and Bunnion, but he does neither. Nor does he follow his facsimile in the orthography of clemency, town, Tinker, meeting, Liturgy, command, etc. That original, he says, "was dated March 4, 1675, O. S." (p. 43). But no facsimile letter is more unmistakable than the figures 1674, which was O. S. until March 22. Again, the warrant's pedigree or chain-of-title in Mr. W.'s showing lacks some links, and those presented are more rusty than in Brown, and above all in W. G. Thorpe, who bought the goodly pearl for a song because he alone among a crowd of bidders knew it was not a mock pearl. How he found this find of a lifetime Mr. Thorpe told in the *Gentleman's Magazine* (vol. 44, 190-200). In this article he inserted every word of the warrant. By reproducing that full text we hope to please not only Mr. White's readers, but not a few of our own, maugre the lack of punctuation:

To the Constables of Bedford and to every of them

Whereas informacon and complaint is made unto us that (notwithstanding the Kings Majties late Act of most gracious gen'all and free pardon to all his Subjects for past misdemenors that by his said clemencie and indulgent grace and favor they might bee mooved and induced for the time to come more carefully to observe his Highenes laws and Statutes and to continue in theire loyall and due obedience to his Majtie) yett one John Bunnyon of yor said Towne Tynker hath divers times within one month last past in contempt of his Majties good Lawes preached or teached at a conventicle meeteing or assembly under color or petence of exercise of Religion in other manner than according to the Liturgie or practise of the Church of England These are therefore in his Majties name to comand you forthwith to apprehend and bring the Body of the said John Bunnion bee fore us or any of us or other his Majties Justice of peace within the said County to answer the premisses and further to doe and receave as to Lawe and Justice shall appertaine and hereof you are not to faile Given under our handes and seales this ffowerth day of March in the seaven and twentieth year of the Raigne of our most gracious soveraigne Lord King Charles the Second A° q^{s} D^{ni} juxta &c 1674. WILL SPENCER

and twelve other magistrates with their seals.

A new and enlarged edition from new plates

KINGSLEY'S **Comparative Zoölogy**

By Prof. J. S. KINGSLEY, of Tufts College. 437 pp., 12mo. $1.20 net.

In this new edition many minor changes have been made, but the principal change is the separation of the laboratory work from the descriptive part of the book. The general plan of the book, which lays special stress on the *interpretation* of anatomical and zoölogical facts, remains unchanged.

MARION R. BROWN, *Erasmus Hall High School, Brooklyn*, in SCHOOL SCIENCE:—Kingsley's book gives a systematic treatment of the whole animal kingdom, making the fish the basis for comparative work. Vertebrates are first taught in an ascending series and then the invertebrates from the complex to the simplest. The book contains laboratory directions for the study of a series of types easily obtainable and gives descriptive accounts of related forms. By combining a laboratory guide with a general outline of zoölogy it emphasizes the comparative side. The method of study is inductive. In selecting types the author has considered four things: (1) locality and availability of animals; (2) average ability of students; (3) microscopic character of the work; (4) consideration of most important facts.

THE MERCHANT OF VENICE - - -	"	TWELFE NIGHT, OR WHAT YOU WILL	(*Sept.*)
THE TRAGEDIE OF MACBETH - - -	"	AS YOU LIKE IT - - - - - - - - -	(*Dec.*)

[*OTHERS TO BE ANNOUNCED LATER*]

Notices of the "First Folio" Shakespeare

"I have taken it to my heart at once, and every votary of the greatest of English books will do the same. What a fortunate idea—to have an American pocket-volume series of these deathless plays in the text of texts, 'a trewe copy' of the text in which they first appeared together, of the reading to which all who have to do with Shakespeare must return and return. . . . I am convinced that these editors are the best equipped among us all for the beautiful yet arduous labor which they have taken in hand. The plan of this volume, with its Preface, Text, Notes, Glossary, Variorum Readings, etc., is mature and satisfying; it is what editing should be, or what, more 's the pity, it so often is not."—EDMUND CLARENCE STEDMAN.

"A very important undertaking. Will hold a place by itself among all the reprints of Shakespeare."—*The Outlook.*

"It will prove, I am sure, the most desirable edition of the Plays which has yet been published. A reprint of the First Folio has never been within reach of the general reading public. You will do more for Shakespeare by this edition than has been done by any previous one."—HIRAM CORSON.

"One of the best that I have seen. Should be welcome to teachers and careful students."—WILLIAM J. ROLFE.

"Done with unusual intelligence. A great gain for Shakespearean students."—HAMILTON W. MABIE.

"Should be acceptable to all readers of antiquarian taste, for Shakespeare as his editors and their printers spelled him is not easily accessible."—*The Nation.*

"You seem to me to have done your work and editing with uncommon skill and thoroughness. I am quite convinced of its value and ability."—SIDNEY LEE.

THOMAS Y. CROWELL & COMPANY

426-428 West Broadway, New York

The Nation.

A WEEKLY JOURNAL DEVOTED TO

Politics, Literature, Science and Art.

FOUNDED IN 1865.

[*Entered at the New York City Post Office as second-class mail matter.*]

CONTENTS OF THIS NUMBER.

THE WEEK 81

EDITORIAL ARTICLES:

Monrovitis 84
The Colorado Ballot and Others 84
The Peabody Fund 85
Reform of Municipal Accounting 86
Irrepressible Reform in Russia 87
Small Art Museums 87

SPECIAL CORRESPONDENCE:

Italy's Tribute to Carducci 88
Tristan and Isolde 90

CORRESPONDENCE:

A Book from the Library of the Earl of Leicester 91
'Alonzo and Melissa' 91
Old Editions for New 92
The First Edition of Pilgrim's Progress 92

NOTES 92

BOOK REVIEWS:

Bishop Creighton 95
A New Coöperative History 96
Recent Fiction 97
The Russo-Japanese Conflict 98
Storia degli Scavi di Roma 99

The Tomboy at Work 100

BOOKS OF THE WEEK 101

TERMS OF SUBSCRIPTION.

Three dollars per year in advance, postpaid, in any part of the United States or Canada; to foreign countries comprised in the Postal Union $4.00.

The date when the subscription expires is on the address label of each paper, the change of which to a subsequent date becomes a receipt for a remittance. No other receipt is sent unless requested.

Remittances at the risk of the subscriber, unless made by registered letter, or by check, express order or Postal Order payable to "Publisher of the Nation."

When a change of address is desired, both the old and new addresses should be given.

Address THE NATION, Box 794, New York. Publication Office, 208 Broadway.

TERMS OF ADVERTISING.

Fifteen cents per agate line, each insertion; 14 lines to the inch.

Twenty per cent. advance for choice of page or top of column.

A column, $20 each insertion; with choice of page, $24.

A page, $30 each insertion; front cover page, $80.

Advertisements must be acceptable in every respect.

Copy received until Tuesday, 5 P. M.

DISCOUNTS.

The NATION is sent free to those who advertise in it as long as advertisement continues.

*** Copies of the NATION may be procured in Paris at Brentano's, 17 Avenue de l'Opera; in London of B. F. Stevens & Brown, Trafalgar Square, Charing Cross.

Educational.

MASSACHUSETTS, Boston.

BOSTON UNIVERSITY Law School. New features. Address the Dean.
M. M. BIGELOW.

HARVARD UNIVERSITY

THE LAWRENCE SCIENTIFIC SCHOOL

offers four-year courses of study leading to the degree of S.B. in Civil, Mechanical, and Electrical Engineering, Mining and Metallurgy, Architecture, Landscape Architecture, Forestry, Chemistry, Geology, Biology, Anatomy and Hygiene (preparation for medical schools), Science for Teachers, and a course in General Science. For the catalogue and information, address J. L. LOVE, 16 University Hall, Cambridge, Mass. N. S. SHALER, *Dean.*

ROCK RIDGE HALL

A School for Boys. Location high and dry. Laboratories. Shop for Mechanic Arts. A new gymnasium with swimming pool. *Strong teachers. Earnest boys.* Fits for College, Scientific School and business. Illustrated pamphlet sent free.

Dr. G. R. WHITE, Principal, Wellesley Hills, Mass.

EDGEWORTH Boarding and Day School for Girls.
122 and 124 West Franklin Street, Baltimore, Md.
Will reopen September 29, 1904.
Mrs. H. P. LEFEBVRE, Miss E. D. HUNTLEY, Principals.

School Agencies.

THE FISK TEACHERS' AGENCIES.
EVERETT O. FISK & Co., Proprietors.
4 Ashburton Place, Boston; 1505 Pa. Ave., Washington; 155 Fifth Ave., New York; 414 Cent. Bldg., Minneapolis; 533 Cooper Bldg., Denver; 80 Third St., Portland; 203 Mich. Blvd., Chicago; 325 Stimson Block, Los Angeles; Hyde Block, Spokane; 420 Parrot Bldg., San Francisco.

ALBANY TEACHERS' AGENCY,
81 Chapel St., Albany, N. Y.—Provides schools, of all grades with competent teachers. Assists teachers in obtaining positions
HARLAN P. FRENCH, Proprietor.

SCHERMERHORN Teachers' Agency,
Teachers—Schools—Tutors—Governess—Property. Tel 6129 18th.
JOHN C. ROCKWELL, Mgr., 3 E. 14th St., N. Y. C.

Teachers, etc.

TEACHING, OR BUSINESS POSITION wanted. E. E. CRAIG, A.B. (Harvard, 1903), 1805 Franklin St., Philadelphia.

PRIVATE TUTOR—Languages and Mathematics. Preparation for college or scientific school. Highest references. Address TUTOR, care of *The Nation.*

A DRAMATIC STORY OF RUSSIA

OLIVE LATHAM By E. L. VOYNICH,
Author of "The Gadfly." At all Booksellers.

Financial.

Letters of Credit

Issued in

Pounds Sterling on **Parrs Bank, London,** and available in all the principal cities of the world, also issued in **dollars** for the use of travelers in this country.

Full particulars upon application.

Redmond & Co.,
BANKERS,
41 Wall Street, NEW YORK.
507 Chestnut St., PHILADELPHIA.

LETTERS OF CREDIT We buy and sell bills of exchanges and make Cable transfers of money on Europe, Australia, and South Africa; also make collections and issue Commercial and Travellers' Credits available in all parts of the world.
International Cheques, Certificates of Deposit.
BROWN BROTHERS & CO.,
NO. 59 WALL STREET, NEW YORK.

Historic Highways of America

By ARCHER BUTLER HULBERT

A series of monographs on the History of America as portrayed in the evolution of its highways of War, Commerce, and Social Expansion.

Comprising the following volumes:

Paths of the Mound-Building Indians and Great Game Animals.
Indian Thoroughfares.
Washington's Road: The First Chapter of the Old French War.
Braddock's Road.
The Old Glade (Forbes's) Road.
Boone's Wilderness Road.
Portage Paths: The Keys of the Continent.
Military Roads of the Mississippi Basin.
Waterways of Westward Expansion.
The Cumberland Road.
Pioneer Roads of America, two volumes.
The Great American Canals, two volumes.
The Future of Road-Making in America.
Index.

In sixteen volumes, crown 8vo, cloth, uncut, gilt tops. A limited edition only printed direct from type and the type distributed. Each volume handsomely printed in large type on Dickinson's handmade paper, and illustrated with maps, plates and facsimiles.

Price for the set, $39.00.

"As in the prior volumes, the general effect is that of a most entertaining series. The charm of the style is evident."—*American Historical Review.*

"His style is graphic and effective . . . an invaluable contribution to the makings of American History."—*New York Evening Post.*

"Should fill an important and hitherto unoccupied place in American historical literature."—*The Dial.*

Full descriptive circular mailed on application

THE ARTHUR H. CLARK COMPANY
Publishers, Cleveland, Ohio

Revised Edition of Rolfe's Shakespeare

40 Volumes
Price, each 56 cents

THE volumes of this new edition have been entirely revised and reset, and appear with every possible mechanical improvement. The books are smaller and more convenient in shape, and plentifully supplied with attractive illustrations. The changes made in revision reflect the results of the editor's studies and the experience gained by the use of the first edition. The greater part of the notes on textual variations have been omitted. In place of many of the "critical notes" Dr. Rolfe has substituted notes of his own. Twenty-five volumes are now ready in the revised form, and others will follow at short intervals.

AMERICAN BOOK COMPANY

A TIMELY BOOK

Trusts, Pools, and Corporations

By WILLIAM Z. RIPLEY
Professor of Economics in Harvard University.

To be Published February 15, 1905.

A collection of important contributions by economic and legal specialists bearing upon the greatest problem in domestic politics now before the country.

Orders for this book may be sent in at once.

GINN & COMPANY, BOSTON

The Nation.

NEW YORK, THURSDAY, FEBRUARY 2, 1905.

The Week.

In the unanimous decision of the Supreme Court against the Beef Trust, we have the most clear-cut and thorough-going affirmation of the power of Congress to break up combinations in restraint of trade. As Attorney-General Moody points out, this decision takes the Court securely back to where it was in the Addyston pipe case. That is, the validity and efficiency of the anti-Trust act are sweepingly upheld. Brushing aside nice technical points about defective pleadings, and so on, the decision broadly, and in the large spirit of equity, declares that such devices as the Beef Trust used to stifle competition and effect monopoly can be struck at and destroyed by existing Federal statute. As Justice Holmes said, the Court does not and cannot direct the individual packers to compete with each other; but it does bring them within reach of the pains and penalties of the law if they seek to substitute monopoly for competition. The law-officers of the Government now have the fullest judicial warrant for proceeding with the utmost dispatch and rigor against every similar combination. It seems to us that this important decision of the Supreme Court has its light for the problem of Federal railway regulation. Here was a strictly normal proceeding. A statute of the United States had been violated. The sworn officers of the law prosecuted the offenders. By regular judicial process the case was brought to its final hearing, and the sword of justice fell upon the guilty parties. That, we think all reasonable men will admit, is the ideal way.

Now, why cannot the Government go to work similarly in the matter of abating evils connected with the management of railroads? President Roosevelt put forcibly and truthfully, in his speech on Monday night in Philadelphia, the grievances which the public feel. In a word, the railroads are not managed justly, as between man and man or locality and locality. They give this shipper a secret rebate, and refuse it to another. Differentials are established affecting this city or that port, not on grounds of public interest which can be publicly stated, but for concealed and often suspicious motives. Here are, indeed, great abuses to be corrected if possible; but is it necessary, or desirable, to make the long jump which the President does, and demand for a Federal Commission the "power over rates"? He urges it with the object of "putting the big shipper and the little shipper on an equal footing"; to do away with rebates, however disguised, and to abolish discrimination of all kinds. But it is at least a fair question whether the Government has not already in its hands the needed weapons, and whether vigorous use of them should not be made before appealing for others. Certain it is that if existing statutes could be stringently enforced, and applied with as much severity as the Supreme Court has just shown in the case of the Beef Trust, the injustices of which the President properly complains would be cured. He asks for an instrument to strike down secret rebates. But they are outlawed by the act of February 4, 1887. Section 2 of the Interstate Commerce Act describes them in detail and declares them all unlawful. Appropriate penalties are prescribed further on. The President is incensed at the "preferences" and "discriminations" which the railroads make in favor of persons or localities; they are all declared illegal in the act of 1887. And the so-called Elkins bill, approved February 19, 1903, strengthens the original law in important respects—defining the offence more precisely, making the collection of evidence easier and judicial process swifter and surer. Mr. Roosevelt is especially urgent that Congress assert "power over rates" in order to strike down secret rebates. That could be done only by imposing a public rate. Yet there are now public rates; it is under them that rebates are made secretly. Why would they not continue under the rates fixed by the Commission? The President calls for justice; let him see to it that the justice in existing laws be done. Until he has tried to do so and failed, it is not in order to ask us to go with him into the dark unknown of Government rate-making.

President Roosevelt has suffered an obvious and deserved check in his San Domingo plans. Even his "protocol," designed to give him practical control of a foreign country, he now admits must be laid before the Senate. It is particularly desirable to teach foreign governments that Mr. Roosevelt is not the American nation. That lesson they may also learn from the deliberate and overwhelming rejection by the House committee of the President's naval proposals. By 13 to 4 it voted that he may have two new battleships only, and that his estimated naval expenditure must be cut by $15,000,000 or so. Foreign naval experts who have been writing in awed tones of "President Roosevelt's formidable naval programme," will please take notice. People and Congress have something to say, after all. The *Army and Navy Journal*, to be sure, declares that "the President has no patience with those members of Congress" who are against granting his demands, and has threatened to "call an extra session to take up the matter of naval increase immediately after the fourth of March." Doubtless Mr. Roosevelt has used wild and whirling words on that subject, as upon others; but doubtless, also, after this session of Congress has expressed its mature judgment against him, he will cool off and quiet down, and turn with unabated energy and enthusiasm to other questions momentarily of eternal importance to him.

News from San Domingo by way of the Isthmus and New Orleans is naturally to be received with a certain reserve; but the admitted facts are grave enough. The President of San Domingo has issued a proclamation stating that the financial administration of his country has been made over to the United States, and our cruisers have been sent to Dominican waters presumably to carry out an agreement which Mr. Roosevelt has no more legal power to execute of his own motion than has William J. Bryan. Of course, the President may now say that he is ordering warships to San Domingo merely to protect American interests. Even if the *Dixie* is to proceed and to land 200 marines, the same excuse may be made to stretch over that action also. But the possibilities of serious complications are great. It is evident that Morales regards his own position as one of the "American interests" which Mr. Roosevelt is to protect, and that he counts upon American aid in putting down all revolutionary movements. Meanwhile, it transpires how purely an afterthought was the determination to submit the whole matter to the Senate in the shape of a treaty. The State Department informs Senator Cullom that it will take time to draft a treaty, and that it cannot be laid before the Senate during this session of Congress.

Innocent to the laughing-point is the Administration's plea for big naval appropriations. Secretary Morton gravely assured the House committee on Thursday that if it would vote $114,000,000 this year, and keep up that rate till the present building programme is completed, the subsequent naval bills would have to carry only $77,000,000 annually. The House will be green, indeed, if it is for a moment taken in by this. Naval building programmes have nothing certain about them except that they will be indefinitely continued and enlarged, if the "experts" have their way. The ex-

perience of France, Germany, and England, to say nothing of our own, leaves this beyond a doubt. There are no tracks pointing backwards from the big-navy den. Secretary Morton's promise of retrenchment later is particularly absurd, coming from him. He has publicly announced his policy to be that of having the biggest navy on earth. He may have stolen the idea from Hobson, but he has made it his own. If the attempt is made to live up to it, the annual bill will be nearer $177,000,000 than $77,000,000. If ever the House is to make a stand for a navy no larger than we need, and for economy, now is the time.

Congress, it is announced, will give Secretary Morton the additional 3,000 sailors which he declares is the minimum increase with which he can get along. Four great armored cruisers are to be finished before May first, and, with the smoke of our deadly enemy among the nations so clearly visible on the horizon, it would, of course, be foolish indeed to put them in reserve at a navy-yard. But while the naval committees are thus generous to Secretary Morton, ought they not to inquire of him why the navy cannot keep its men, once it gets them? Here is the *Army and Navy Journal* admitting that 500 men deserted from the North Atlantic fleet while it was repairing this fall, of whom no less than 100 fled from one battleship. There is something very rotten in the state of Denmark when this can come to pass without anybody's being brought to book. Good ships are all very well, but if our sailors run away from them in droves, what then? Ought not that battleship commander who lost one-fifth of his crew to have been called on for an explanation? The loss to the Government in time and money wasted is obvious, and as few of the deserters are recaptured, its prestige suffers the more. We should not feel at all sorry if sensible Americans declined to enlist in the navy simply to man an extravagant war fleet. But, once in, sailors ought to be compelled to live up to their obligations. Their failure to do so creates, rightly or wrongly, the presumption either that the men are worthless or the officers unfit for command.

The House Committee on Rivers and Harbors has taken a hint from modern philanthropy in making some of the appropriations which it recommends contingent on the coöperation of the local or State authorities. Since many of the projects on which the Government spends money are local in character, and in some cases are absurdly far from having any national importance at all, this requirement may serve both as a guarantee of good faith and a substantial economy on the Government's side. Every project, of course, has its peculiar features. In many cases, as, for instance, the connections between the Great Lakes, the district in which the work is actually done profits by it insignificantly compared with the distant cities whose commerce will pass through the new channels. Thus, if this policy is permanently adopted, a new element of complication is introduced in an already involved situation by the necessity of deciding how much of the cost of each piece of work shall be assessed on the locality. The State governments which adopt a similar policy with regard to road-making adhere generally, we believe, to the plan of paying a uniform percentage of the cost of new roadways. That would scarcely be just if applied to waterways. The effect on the individual Congressman is another phase of the proposal. He must try not only to get as much work as possible done in his district, but also to have as little of the cost as possible paid by his constituents. A new channel for the local river will not be so much clear gain. "It is true that Perkins got us a $200,000 dam," his opponent on the stump will say, "but we had to pay $50,000 of it ourselves. Over in the next district they got the same amount, and the Government paid all but $10,000. I pledge myself, if elected, to insist on the latter ratio hereafter."

It is not probable that Congress will pass offhand the bill establishing the whipping-post for wife-beaters in the District of Columbia, in spite of the President's suggesting it in his message. At the same time, the speech which Mr. Adams of Pennsylvania made in support of his measure contained some striking proofs of the inadequacy of the present criminal laws to suppress this kind of brutality. Inquiries of the district attorneys of every county in Pennsylvania brought out the fact that in one year 527 complaints were made to the grand juries of assault and battery on wives by their husbands, and 287 true bills were found. This takes no account of the cases, everywhere reported to be many, which came before justices of the peace or were settled before trial. Convictions were secured in 211 cases, and the average sentence was for three months. In eleven counties the district attorneys expressed the opinion that the crime is on the increase, while thirty-six denied that it was. From eight counties cases were reported in which the families of the men convicted became a public charge during the time that the breadwinner was serving his sentence. Everywhere, too, are found cases in which the ill-used wives begged for the release of their husbands, because the incarceration of the head of the family meant absolute destitution. It can hardly be denied that in this regard the present laws punish the victim quite as severely as the criminal.

That accursed word *Independence*—the moral antithesis of "that blessed word *Mesopotamia*"—begins to fall trippingly from the lips of Secretary Taft. Before election, as we all remember, the talk about independence for the Philippines, even at a distant and unfixed date, was extremely disturbing to this acknowledged friend and champion of the Filipinos. The mere sound of this irritating vocable, so he asserted, was almost certain to stir up evil passions among our little brown brothers, and turn their minds from the peaceable fruits of industry and righteousness to the Dead Sea apples of political agitation. In fine, Secretary Taft was convinced that no well-wisher of either the United States or the Philippines would unsettle matters by whispering that independence was possible. The obvious inference was that the Democrats, who occasionally touched on the topic, were enemies of the Republic. But after election Secretary Taft's nervousness gradually wore off. In spite of the recklessness of the Democrats, the skies had not fallen, the predictions of anarchy and chaos in the islands remained unfulfilled. Plucking up courage, the Secretary himself began to speak of independence under his breath, and finally on Saturday he uttered the word aloud at a committee hearing in Washington:

> "Whenever they reach the condition where they have a reasonable public opinion which may be relied upon to restrain radicalism; when inter-island communication has been established; and when conditions generally have become settled—then, if they desire independence, give it to them."

This looks dangerously like conceding what the petition of the college presidents and other impracticables asked for. But, however the concession may be viewed, talk of independence for the Philippines will no longer be treasonable.

After eighteen months of trial, the New Hampshire liquor law, in the opinion of the State License Board, which has just made its annual report, needs amendment in several matters of detail, but requires no fundamental modification. While agitation for return to statutory prohibition seems to be active this winter, the license system is, according to the popular verdict, giving better satisfaction in New Hampshire than in Vermont. In the former State, in the November election, 24 towns changed from license to no-license, and 14 from no-license to license, leaving the totals, 47 "wet" to 177 "dry." The 11 cities, all of which voted for license in 1903, do not submit the question again until 1906. There is thus in New Hampshire nothing like the reaction which made 44 Vermont towns

change from license to no-license last fall, as against only one which made the opposite change. At the same time, the commissioners point out one difficulty which other States ought to heed as well. In places which voted against license, the report states, the people have looked solely to the State authorities for the suppression of illicit selling. This same disposition to regard liquor laws as automatic in their action is the root of many evils. Some of them appear in the attitude of local authorities towards the administration of the Raines law in this State.

The establishment by Mr. Henry Phipps of a $1,000,000 fund for model tenements is the most important step yet taken by a private citizen to improve local housing conditions. Model tenements hitherto built have been strictly commercial undertakings. As far back as 1879, Mr. Alfred T. White, whom Mr. Phipps has wisely chosen as one of his trustees, erected a block in Brooklyn, upon which he has since realized a profit of 6 per cent. The success of the City and Suburban Homes Company in building tenements which should furnish decent living quarters for wage-earners and at the same time pay a fair return, has recently led to an increase in its capital stock. The Phipps endowment will in time reach huge proportions. The $1,000,000 given in trust is to be invested in high-class tenements. After the payment of taxes and other expenses, a net profit of 4 per cent. is expected—a conservative estimate. This, in turn, is to be invested in more tenements, and so on. In other words, the $1,000,000 is to be placed out indefinitely at compound interest. At 4 per cent. money doubles at compound interest every eighteen years. Thus, in 1923 the Phipps fund will amount to $2,000,000; in 1941 to $4,000,000; in 1959 to $8,000,000; in 1977 to $16,000,000; in 1995, to $32,000,000; and, in little more than a century hence, to $64,000,000. One must also reckon in the increment in the value of the land. In New York there are thousands of acres, now vacant, which fifty or a hundred years hence may have enormous value. The land investments of the Astor family are the classic illustration. The first John Jacob invested $2,000,000 in New York real estate; according to competent judges, its value to-day, plus the value of the land purchased by its earnings, ranges anywhere from $300,000,000 to $500,000,000.

Mr. Phipps has unquestionably set his present trustees and their successors a unique problem in philanthropy. In a hundred years New York will have an enormous fund; but its usefulness will depend upon the wisdom of its custodians. We think they would make no mistake if they devoted at least a portion of the fund to model tenements for the use of New York's colored citizens. Their plight is grievous. Only the worst buildings are open to them, for which they are charged higher rents than are asked of white people, on the ground that negro occupancy of a house causes it rapidly to deteriorate in value. Now the negroes are great home-lovers. With all their defects they are cleaner, as a class, than many of our foreign immigrants, and they make remarkably few appeals for public funds. Yet decent colored people are often forced into disreputable associations for lack of other quarters, and their need of good tenements is great. Moreover, a building of the kind might also be arranged to contain a kindergarten, or to serve as headquarters for other agencies, maintained by both whites and blacks, at work among our colored residents. Such a common meeting-ground would be of the greatest value in bringing about a better understanding between the races.

Mr. Akers-Douglas's statement that the Ministry, unless earlier outvoted, will serve out the full Parliamentary term, points the fact that Mr. Balfour takes an unconscionable time in dying. That he should cling to life is natural, since dissolution would bring crushing defeat. This prophecy the bye-elections make, clearly. In forty-one contests since May, 1902, the Liberals have changed a representation of thirty Conservatives and eleven Liberals and Labor men, to twenty-six Liberals and Labor men against fifteen Conservatives, almost reversing the ratio. No wonder, then, that Mr. Balfour is in no haste to ask the verdict of a general election. Meantime, everything is in flux. Mr. Balfour makes bold to tell an audience that the fiscal question is becoming a bore. Mr. Chamberlain—who is now only a Unionist in the ranks, "unless" — raves that imperial reciprocity alone stands between the Empire and disaster. Young Mr. Austen Chamberlain keeps sugar schedules in the budget proposals, although his father, who has put aside that contempt of jam and pickles which he once expressed so forcefully to Mr. Winston Churchill, promises the British free sweetening in the tea wherewith the dear loaf is to be washed down. Even the Liberals share in the prevailing uncertainty. Under these circumstances, it seems probable that the budget will pass without great difficulty, and that any peril to the Ministry is contingent, and due chiefly to the fact that, like the fiscal question, it has become very much of a bore.

The election returns from Hungary leave no doubt of the overwhelming defeat of Count Tisza, the full extent of which will not be known till February 6, when the polling in the 413 election districts will be completed. The united Opposition has so far captured 242 seats out of 393, the Kossuth party alone gaining 159. The Premier will probably defer his resignation until all the returns are in, when the re-grouping of parties will make the selection of his successor easier for the Crown than it is at present. Francis Joseph has, with his usual tact, refrained from interference in the election, and it must be conceded that both Tisza and the leaders of the Opposition have carried on a campaign notable for eloquent and effective presentation of contending issues. The Premier staked his all on the principle that the majority must rule, even at the cost of a technical violation of the letter of the Constitution. In his address to the electors of Budapest he also dwelt with great force on the economic questions involved —on the need of ending the provisional fiscal arrangements between Cisleithania and Hungary, which have existed since 1897, and on the risk of claiming a separate customs territory for Hungary, which could develop her industry only at the cost of impoverishing her agriculture. He held out substantial concessions to workingmen, and promised an extension of the suffrage "consistent with the predominance of the Magyar race." But all these appeals were ineffectual, and the Liberal party, for the first time since the *Ausgleich* of 1867, has to give way to an Opposition.

It is not difficult to account for the uneasiness with which the defeat of Tisza is regarded in Vienna and throughout Austria. Hungary has for the first time broken with the tradition of her great leader, Francis Deák; and the name of Kossuth, however potent its spell in Hungary, has, in its descent from father to son, not lost its revolutionary significance in Cisleithania. And yet there is no valid reason for considering the stability of the dual empire threatened by the ascendency of the Kossuth party. The now formidable coalition of Radicals, Nationalists, and Clericals, reinforced as it is by the powerful names of Counts Batthyányi, Zichy, and Károlyi, cannot long survive the campaign. Francis Kossuth himself has spoken in tones which, however fervent in defence of the rights of Hungary, are not incompatible with that moderation which befits the change from a revolutionary agitator to a responsible minister. He affirmed that his principles, while uncompromising, were "legal and loyal"; and he would not be the first Hungarian adviser of the Crown with a revolutionary past. Count Andrássy, after being sentenced to death in 1850, became the trusted and sagacious minister of Francis Joseph. Nor is Austria the only country that has witnessed such radical transformations. Francis Kossuth, who spent his youth and early manhood in Italy, may be pondering the vicissitudes of Crispi's career.

MONROVITIS.

Apparently, the best explanation of the President's San Domingo involvement is that much Monroe Doctrine hath made him mad. A form of nervousness, not yet well described by the faculty, seems to afflict all who brood too intently upon the Doctrine. The malady is peculiarly unfortunate when it attacks a President. It confuses his mind, and makes him an easy victim to the hallucination that his oath of office binds him to maintain, not the Constitution, but the Monroe Doctrine.

Hitherto, at any rate, Mr. Roosevelt had given no sign that he thought the Constitutional powers of the President had any pertinence to what he was undertaking in San Domingo. The "protocol," or "agreement," which was signed in San Domingo on Friday week, seemed to be regarded by the Administration as complete and binding of itself. "The American Government guarantees the complete integrity of Dominican territory." The statement was absolute. "The agreement will take effect after February 1 next." The Senate had nothing to do with it. Indeed, the *Tribune's* Washington correspondent, who has throughout spoken in this matter by direct inspiration, telegraphed explicitly on January 22, "The arrangement has none of the attributes of a treaty, and will not require ratification by the Senate." But a great light has since dawned upon the President and Secretary Hay. Unpleasant words like "impeachment," used even by Republican Senators, may have had something to do with it; anyhow, it was announced on Thursday last that the San Domingo agreement would be submitted to the Senate, after all.

This made it certain, then, that there would be no taking effect on February 1. Hence it became important to know whether the President had or had not given orders to make it take effect. The dispatches have asserted that ships have already been sent with instructions to take over the Dominican custom houses, as per agreement; and that our naval forces have already begun to help President Morales put down incipient rebellion. That astute Executive seems to have driven an uncommonly good bargain. It was really his "integrity" that President Roosevelt proposed to guarantee. By policing and financing the Morales Administration, it could easily be kept in power indefinitely—or enabled to turn over the Government to a political heir, or to the highest bidder. But considerations of that order are not so important as the question whether President Roosevelt has rashly gone forward as if the treaty were already ratified. In that case, the illegality would be as glaring as was that of President McKinley in acting under the Treaty of Paris before it was made law, or of Mr. Roosevelt himself in ordering the Colombians out of their own territory at Panama. The Senate resolution should be amended so as to inquire whether the President has, in a free and easy application of the doctrine of *nunc pro tunc*, assumed that his negotiation of a treaty was equivalent to its becoming the law of the land.

The motives which induced the President to embark in the affair are set forth with the utmost simplicity in the official statement issued on January 22. He confesses that he went into the business with great reluctance. "Many foreign claims" against San Domingo "are just beyond peradventure." "More than one of the great Powers" had "explicitly, repeatedly, and emphatically" brought the attention of this Government to the justice of their contentions. Something had to be done. Yes, but why not the obvious thing of telling these foreign nations to go ahead and collect their just debts? That has been the precedent of recent years. The English seized the custom house in Corinto to compel Nicaragua to meet her obligations. Only three years ago, with President Roosevelt assenting, Germany applied force to Venezuela with a similar object and result. Yet Monroe did not rise from his grave in horror. Mr. Roosevelt, in fact, took pains to explain that the proceeding was in perfect harmony with the Monroe Doctrine. Then why has what was good in Nicaragua and Venezuela suddenly become impossible in San Domingo? Because Monroeism has since been getting on President Roosevelt's nerves. Those who speak for him say that the spectacle of foreign creditors collecting their dues from San Domingo would be too much for this nation; that we should be in danger of going to war to prevent it; and that, therefore, though the process of stepping in and administering the Dominican Republic is filled with embarrassments, and is certain to be vexatious and costly, the President has to do it or be false to his sworn duty to see that the Monroe Doctrine take no harm. All of which, in view of the facts, and considering well established precedents, sounds very much like the talk of a person laboring under nervous excitement.

Of all spots on earth, San Domingo is the last one where an American President should display impetuosity. Where Grant burned his fingers so badly, Roosevelt ought not to play with fire. And how absurd the official assurances of what will happen in San Domingo unless we act as its receiver, read when we recall what was said with similar gravity, as of unquestionable authority, thirty years ago. In 1871, the commissioners appointed by President Grant to report on San Domingo—men of such weight as B. F. Wade, Andrew D. White, and Dr. S. G. Howe—put their names to the prediction that, if the United States did not annex the island, "one of the fairest and richest on earth," "some strong nation" would "seize it and hold it in colonial subjection." It was one of the earliest uses of the argument that we must commit a folly in order to prevent some other country from being foolish. But we should think that the ludicrously unfulfilled prophecy we have cited ought to make our most angelical Monroe Doctors a trifle cautious in forecasting future troubles. To keep out of present muddles is work enough for them.

THE COLORADO BALLOT AND OTHERS.

The States which were involved in difficulties over the returns of the last election are naturally the first to interest themselves in the revision of their ballot laws. Thus, the Colorado Legislature, whose committee is just settling down to the work of finding out who was legally elected Governor last November, will also have to consider many suggestions relating to the subject.

But for one feature, the present Colorado ballot would be of the pure Australian type, as used in Massachusetts and generally agreed to be the best yet devised; but this one feature vitiates all the peculiar merits of that form of ballot. To describe it briefly, the candidates for each office are grouped in a separate "box," within which they are arranged in alphabetical order, each name being followed by the party designation. There are no party columns or emblems. This arrangement was devised in order to encourage independent voting by compelling the voter, whether he concludes to vote a straight or a split ticket, to record his preference separately for each one of the offices to be filled. But the legislators who designed this Colorado ballot nullified all the good they had done by putting across the top of the blanket-sheet, in heavy type, the unique legend, "I hereby vote a straight ——— ticket, except where I have marked opposite the name of some other candidate." In the blank, the voter writes "Republican" or "Democratic," as the case may be, and afterwards, if he so desires, can put crosses opposite the names of some of the other party's candidates in the "boxes" below. This not only takes away the special advantage of the Massachusetts ballot, by making it possible to vote a straight ticket at one operation, but also furnishes a means of identifying the voter by his handwriting. Thus, in the proceedings before the Supreme Court, experts were able to testify exactly how many of the ballots found in a particular ballot-box were written by the same person.

Judge Ben B. Lindsey, an official who has himself been kept in office by the support of Independent voters of other parties, has issued a long open letter on

election reform, and drawn up three bills to secure it. Rightly putting first the need for better registration laws, he also proposes a new ballot. He does not favor, however, the simple remedy of taking off the straight ticket blank, but prefers a return to the regulation party column. His ballot, in a word, would be precisely like ours in New York, minus the circle at the head of each column for voting a straight ticket. With the Massachusetts ballot it is, mechanically speaking, exactly as easy to vote a split as a straight ticket. Under Judge Lindsey's plan, it would be slightly easier to vote straight, as the pencil would then travel directly down the column, while to scratch the ticket it must be moved from one column to another.

In Missouri, which now has perhaps as bad a ballot as there is anywhere in the country—a separate slip for each party, which the Independent voter must alter by scratching out one name and writing in another—the advocates of reform are urging the complete Massachusetts ballot as the ideal one. At the same time, in one of the States which already have this blessing, there seems to be a strong movement to get rid of it. Gov. Utter of Rhode Island suggests in his message that some method be provided of voting a straight ticket without going through the entire ballot. Senator Dyer has introduced a bill for this purpose, and the Republican State chairman is enthusiastic over it. The change, of course, would do away with the whole special virtue of the ballot, but there is apparent plausibility in the talk about the "rights" of the straight party man. "Why," he asks, "should I be compelled to make thirty or forty crosses on my ballot, and keep other voters waiting, when I have definitely made up my mind to vote for all the nominees of my party?" This question, in fact, is fundamental to the whole ballot problem. In Rhode Island, for instance, there were cast last year for State officers 30,000 straight Republican ballots, and 22,790 straight Democratic ballots. Of the other 21,670, at least a third were straight ballots for minor parties or rejected ballots. Thus 15,000 would more than cover the number of split ballots. It is argued that the present ballot puts the 52,000 to unnecessary trouble to suit the whims of the 15,000.

The answer to this, of course, is that the election is not held to decide which political organization or boss is most popular, but to choose certain officers; and it is absolutely reasonable and just to ask the voter at least to look at the several names before saying which he wants. The common metaphor is that the premium on the straight ticket makes it easy to force the voter to gulp down the whole dose prepared for him, because of the difficulty of taking out the nauseous elements. As a matter of fact, the dose is not even prepared by a single apothecary. The straight ticket is really a mere abstraction of party politics. Some of the names on it are selected by the national, some by the State, others by city, county, Congressional, and legislative conventions. The voter may have absolute confidence in the wisdom and patriotism of the Democrats who met at Saratoga and nominated Herrick and his associates, but in no possible sense does that imply that he endorses everything done by the ward politicians who assemble in an East Side hall to pick out an Assemblyman. For all this, the thick-and-thin party man will continue to talk of the right to "vote her straight" in half a second, as if that were expressly mentioned in the Declaration of Independence, whereas, as one of our Missouri contemporaries has pointedly remarked, it is probably as "un-Jeffersonian" a notion as has ever gained currency.

Our New York ballot is devised on a bad theory, but it is carefully safeguarded, and the voters are exercising greater freedom in marking it, as they come to understand it and lose their fear of making mistakes. Certainly, we are better off than the citizens of such States as Colorado and Maryland, where the lawmakers, for partisan ends, have played tricks with a form of ballot which is in its conception the very essence of fairness.

THE PEABODY FUND.

The decision of the trustees of the George Peabody Fund for the advancement of education in the South to dissolve their trust was not unexpected. It has been known for a year that this action was being discussed, and that a great teachers' college was to represent the final investment of a fund which has been of incalculable value to the States that formed the Confederacy. The original deed of gift of Mr. Peabody, dated February 7, 1867, conferred upon the trustees the power to close the trust after the lapse of thirty years, and provided that, of the funds remaining, two-thirds should be distributed among "educational or literary institutions in the South, or for such educational purposes as they may determine, in the States for whose benefit the income is now appointed to be used." "The remainder," Mr. Peabody added, "may be distributed by the trustees for educational or literary purposes, wherever they may deem it expedient." By last week's vote, one million dollars is given to the Peabody Normal College at Nashville, Tenn., that city having pledged itself to raise a similar sum for this institution. The remaining $1,200,000 is to be distributed among various institutions at the October meeting, when the trust will be finally dissolved.

Mr. Peabody's original gift for the "educational needs of these portions of our beloved and common country which have suffered from the destructive ravages, and the not less disastrous consequences, of civil war," was the sum of one million dollars. But, in addition, he placed in the hands of the trustees bonds of the State of Mississippi, known as Planters' Bank bonds, amounting, with interest, to about eleven hundred thousand dollars, which were subsequently repudiated. "Never," said the late J. L. M. Curry, until his death the general agent of the Fund, "was gift more timely. It came, white-winged messenger of peace and fraternity, in the hour of gloom, poverty, and despondency." Robert C. Winthrop, the first chairman of the board, declared that it was the earliest manifestation of a spirit of reconciliation from the North towards the South. There are many living who recall the thrill of gratitude which this wise gift produced throughout the country, for in 1867 benefactions of such a size were rare, though we have since become accustomed to them. Moreover, Mr. Peabody, with unusual insight, gave to the destitute and neglected masses where others bestowed their endowments on colleges or scientific institutions. It was characteristic of the man that this benevolence was planned long in advance and precisely as he would have worked out any commercial enterprise.

The original trustees and their first general agent, Dr. Barnas Sears, were quick to lay down the principle that the fund was to be utilized to stimulate free public schools for whites and blacks, and to reject the theory that its chief duty was to dole out charitable aid to all in want of the means of education. The promotion of primary or common-school education was the first aim; but the effort was from the first limited to schools in which large numbers could be gathered together, instead of favoring small schools either directly or by paying for the tuition of poor children. A second aim was the development of State normal schools and the training of teachers, white and black, for work in the primary schools. The enlargement of the Nashville School is not only in keeping with this purpose, but is a recognition of what is to-day still the great educational need of the South—the preparation of competent teachers of both races and both sexes. Thanks to the educational campaign carried on by the Southern Education Board and the General Education Board there is a keen realization of what such an institution means to a State. This in itself shows how far the South has advanced since the hour of Mr. Peabody's great benefaction.

Without it and the equally memorable Slater Fund, these new agencies for the educational uplifting of the South would have found the field they are tilling far more difficult and more barren than has been the case. Mr. Peabody

followed up his first gift with another million dollars in 1869, in addition to other deferred securities similar to the Mississippi bonds, and similarly repudiated. With these means the first trustees carried on the original policy until 1879, when the Southern States had thoroughly committed themselves to the work of establishing and carrying on free public schools. Deeming their primary purpose then completed, the trustees concentrated their efforts upon normal schools, a policy that was received with marked favor in the South, and which resulted in the rapid establishment of three normal schools in Virginia: the Sam Houston at Huntsville, Texas; the State Normal and Industrial School at Greensboro, North Carolina, and many others, most of which, with the aid of the Peabody fund, have grown into increasingly important institutions. The Peabody Normal College, which was established in 1875 on the grounds of the State University at Nashville, received from the fund $383,584.10 in scholarships for the twenty years from 1877 to 1897, and substantial aid from the State, which has appropriated $15,000 a year since 1891. From 1868 to September 30, 1897, the total income distributed in twelve States for public and normal schools reached the great figure of $2,478,527.13. In 1900, the income paid out amounted to $84,055.61; in 1901, $80,229.57; in 1902, $79,880.41, and in 1903, $75,400.00. In the last-named year, appropriation for State institutes (gatherings of teachers) was discontinued in favor of the summer schools stimulated by the General Board, and October, 1904, was fixed as the time after which no more scholarships should be awarded to pupils at the Nashville normal school.

Within brief limits, it is impossible to do more than merely indicate what has been accomplished by Mr. Peabody's philanthropy and wise foresight. The dissolution of the trust will obviously not for a moment end the work it has undertaken; nor is it to be regarded as a sign that Southern education no longer needs aid from without. To the Southern and General Education Boards has fallen the task of carrying on the stimulation of public schools, with remarkable success. Actuated by a broader policy, notably the scientific studying of the problems to be faced, they have only just begun to enter the field in which George Peabody was the pioneer who made these later, far-reaching enterprises possible.

REFORM OF MUNICIPAL ACCOUNTING.

Few efforts to improve the government of American cities have acquired greater momentum in a comparatively short time than the attempt to secure reasonable uniformity in municipal accounting. Leadership in the movement seems to have fallen, by general consent, to the National Municipal League, represented by an efficient committee at the head of which is Dr. Edward M. Hartwell, the City Statistician of Boston. In 1903 this committee enlisted the cooperation of the State Commissioners for promoting uniformity in legislation, as well as of the Census Bureau, which is making commendable efforts to coordinate all branches of statistical inquiry in the United States. Moreover, an increasing number of cities are enlisting the services of professional accountants in the installation of improved systems of bookkeeping, and following more or less closely the schedules proposed by the committee of the Municipal League. In short, we now find associations of public-spirited citizens, the Federal census, progressive city officials, and professional accountants of national repute joining forces with a view to placing the movement upon a basis at once business-like and scientific, and therefore eminently practical in every sense of the word.

From the outset, the committee of the Municipal League has wisely confined its efforts to devising a simple and practical scheme for summarizing the accounts of an American city, and has not attempted to elaborate a complete system of bookkeeping designed to displace existing methods. In many cases, doubtless, the methods of bookkeeping are so rudimentary or chaotic that the installation of a new set of books is the first desideratum, as was found to be the case in Chicago and some other places. But the impetus to such far-reaching changes must, of necessity, proceed from local movements, like that inaugurated by the Merchants' Club in Chicago, and cannot come from the recommendations of an outside body. The committee felt that much would be accomplished if local officials could be induced to summarize city accounts according to some rational and uniform scheme; and that, if this could be secured, the improvement of bookkeeping methods would naturally follow. The schedules proposed for model comptrollers' reports were first advanced tentatively; and then, after being put to repeated practical tests, in Boston, New York, Baltimore, Chicago, and elsewhere, were gradually amended at points where it appeared possible to improve them. Although further amendment may prove desirable, the schedules, as they stand to-day, offer a consistent scheme of classification, which has endured well the test of experience.

We regard it as especially fortunate that the coöperation of the Census Bureau is now assured. As early as 1850 the Federal census undertook to present facts concerning the valuation and taxation of property; and the scope of this inquiry was broadened, decade by decade, until in 1890 a large body of statistics was gathered concerning the finances of our States and minor civil divisions. In 1902 the collection of social statistics of cities with over thirty thousand inhabitants, which had previously fallen to the Department of Labor, was transferred to the Census Bureau, and it at once began to gather financial statistics of the larger municipalities. The report, which will soon be published, will present comparative exhibits of municipal payments and receipts, classified in accordance with the general plan of the National Municipal League. This investigation is to be repeated at intervals of two years, and will accustom city officials to repeated demands for financial statements prepared in such a form as will make them available for comparative purposes. If the census authorities are alive to their opportunities, they may easily exert a steady pressure in behalf of uniform municipal accounting. So far, it is reported, city officials have shown commendable readiness to coöperate with the census; and it seems probable that in this direction lie the greatest opportunities for progress in the immediate future. It is an interesting commentary upon the need of such a movement that in three cities the special agents of the census disclosed irregularities which led to the indictment of the officials concerned, and that in several others their inquiries were delayed by the fact that the books which they wanted "were in the hands of grand juries."

New York has lagged behind some of the other States in this important movement. The law of 1903, which required cities of the second and third class to file classified reports annually with the Secretary of State, was a step in the right direction, and was perhaps as much as should be attempted at the outset. The returns received under this law will undoubtedly possess much interest, but they will probably demonstrate the necessity of following it up with a more comprehensive and efficient statute. In his last report the State Comptroller recommended that a more complete scheme of accounting, with provisions for effective supervision, should be established; and it is to be hoped that some such measure may be enacted at the present session of the Legislature. New York cannot afford to neglect the example set by such States as Ohio, Wyoming, and the Dakotas; and should, without further delay, insist upon reasonable order and uniformity in municipal housekeeping. This is a matter in which sporadic action by municipalities cannot meet the needs of the case, and one in which universality and uniformity are highly desirable. And, perhaps, while the subject of public accounting is under consideration, it might be well to inquire whether the accounts of the State itself

cannot be stated in such form that the average citizen could, if he should so desire, ascertain the net expenditures and revenues of the commonwealth for any fiscal year.

IRREPRESSIBLE REFORM IN RUSSIA.

Prince Kropotkin's article on "Constitutional Agitation in Russia," in the January *Nineteenth Century*, lights up the Russian political situation. He writes with such sure-footed knowledge of both the past and present of his country; is so closely in touch with all its political movements, whether radical or reactionary; has so many correspondents in Russia, and such means of sounding provincial sentiment as well as that of the great cities, that his words are clothed with the greatest authority. If the supreme test of science is its power to predict, then Prince Kropotkin's article may be said to be really scientific, since it foretold the events of ten days ago. Speaking of the political demonstrations of November and early December, he wrote: "They surely will be joined by workingmen. . . . And if they are dispersed by force, they will result in bloodshed, of which none can foresee the end."

Yet there was "nothing unforeseen," asserts Kropotkin, in the demand for a Russian Constitution guaranteeing national representation. It seemed to be put forward suddenly and dramatically in November, but it was only the inevitable result of slowly moving forces. For years it has been true that dissatisfaction with the autocratic régime has been acute and mounting. The universities have been honeycombed with unrest and the spirit of revolt. "Wherever a few educated persons come together, nothing is spoken of but the coming Constitution." Of course, the reformers have, to encourage them, the memory of Alexander's II.'s action, twenty-three years ago, in preparing to grant what was practically, though not in name, a Constitution. He was assassinated just before the manifesto was to be issued. His son thought, for a time, of going on in the same direction, and actually wrote to his brother: "I feel so happy; the weight is off my shoulders; I am granting a Constitution." But Alexander III. was soon captured by the reactionaries, with Pobiedonostseff at their head, and, instead of a Constitution, proclaimed his intention to "take the ruling power in our own hands."

Some of the conditions which make the existing system intolerable are pictured by Kropotkin with striking detail. The bureaucracy steadily eats away every legal right, every judicial safeguard, of Russian subjects. For example, the so-called Judicial Law of 1864 contained guarantees against arbitrary action by the police. Citizens, even those accused of political crimes, were to be taken before magistrates. But this law has been torn to pieces by no less than *seven hundred by-laws* issued since 1864, limiting the rights of the courts, abolishing public trial, and so on, until, as the lawyers of Saratoff declared in public meeting, "all the principles of the law of Alexander II. have been annihilated. This law exists only in name." Statistics prove the assertion completely. In 1903, for example, "4,867 persons were submitted to various penalties, including imprisonment, inflicted by the Administration, with out the interference of any magistrate. Out of these, no fewer than 1,502 were sent into exile, for terms up to ten years." Compare this with the corresponding figure for the last year of the reign of Alexander III. (1894), when it was only 55! No wonder that the resolutions passed by the Moscow lawyers should lay down the general principle:

> "It appears from Russia's whole life for the last forty years that it is absolutely hopeless to endeavor to introduce in our country the reign of Right, so long as the arbitrary rule of bureaucracy continues to exist, even though all sorts of rights may be inscribed in our code."

Of the present Czar, Kropotkin writes without bitterness, yet with a keen sense of his vacillating and feebly striving character. Weak for good, Nicholas has somehow found strength enough to resist the forces making for better governmental policies. "At the decisive moment, he always had enough energy to turn the scales in favor of reaction." So it was in Poland, in Finland, in Armenia, with the zemstvos, with the students. Yet it was with the Czar's consent that Witte "began to prepare the gradual passage from autocracy to some sort of Constitutional régime." His commissions on Russian agriculture, cooperating with the zemstvos, brought out overwhelming testimony from all classes, noblemen and peasants alike, that Russia is perishing under police rule. This inquiry, as Witte's delayed report at last shows, was designed to hasten the granting of certain political liberties and a degree of representative government. But the reactionaries again prevailed upon Nicholas. He displaced Witte by promotion to the Council of State and made Plehve omnipotent. What happened to the latter, we know. The question now is whether Witte, with his plan of moderate progress and safe concessions, will be permitted again to direct the Imperial policy.

Of one thing Kropotkin is convinced. Whether or not the autocracy decides to yield something, it "never will be able any more to stop the movement." What has occurred since this was written tends but to confirm it. The thing is too big and has too much vitality to be extinguished by even blood and iron. All classes in Russia have caught the new spirit. It used to be only the young men who were revolutionaries. In the circles of the seventies, writes Kropotkin, "a man of thirty was an old man." Today, graybeards join the youth in protesting against the autocratic bureaucracy. Landlords are at one with peasants; the educated with the working classes. Far in the interior the ferment is at work; Kropotkin testifying that the local newspapers sent to him "reveal quite a new provincial life." Already the zemstvos have brought forward men with talent for administration. That they will, in time, be called to exercise it in national affairs, is Kropotkin's positive prediction. Hopeful old revolutionary that he is, he writes like one in sight of the promised land. He may not live to enter it, but others of his compatriots will, unless the laws of political progress are suddenly abrogated.

SMALL ART MUSEUMS.

It is most interesting news that Mr. Charles J. Freer of Detroit has offered his remarkable collections, with a building in which they are to be kept intact, to the Smithsonian Institution at Washington. This gift, we note, is somewhat vaguely said to include his paintings and prints; one would gladly learn that it comprises, besides his well-known Whistlers and the little group of modern Americans, also those Japanese color prints and paintings which afford so suggestive a parallel to the Western examples. In Whistlers, it should be recalled, Mr. Freer's gallery is extraordinarily rich; about fifty paintings and drawings from it were shown in the Boston Whistler exhibition of last spring. Since that time he has acquired the famous peacock decorations which were the occasion of a notable quarrel between the peppery master and the shipbuilder Leyland. In his American purchases Mr. Freer has stuck pretty closely to the works of Messrs. T. W. Dewing, Tryon, Horatio Walker, and Abbott Thayer, of whom he possesses admirable canvases. All of his objects of art Mr. Freer has lent with the greatest liberality, and the occasion of their assemblage and installation at Washington may furnish not only to outsiders, but to the owner himself, the first opportunity in years of seeing the collection in its integrity.

But the conditions of the gift are more interesting than the inventory of Mr. Freer's treasures. He purposes to build a small building and increase the collections during his lifetime, and he requires that no change shall be made after his death. The plan, then, is for a miniature museum representing an individual taste, and it is easy to see how such a collection can be given a greater attractiveness than is possible in the vast halls of public museums. Mr. Freer means, we understand, to reproduce the famous Peacock Room. It will

form an ideal setting for Whistler's works of a certain period—an extraordinary show-place for Chinese porcelains. In fact, this use is already suggested by the central figure in the decorative scheme, "La Princesse du pays de porcelaine." Throughout the little building one may imagine the kind of congruousness that makes a well-ordered private collection a comfortable place to linger in, whereas comfort is had in a public museum only by a resolute effort of detachment and concentration.

We believe that Mr. Freer's gift, if not the first of its kind in America, is the first of importance. We trust it may prove a stimulus and a warning to other public-spirited collectors, since frequently a personal collection is given to a great museum with the condition that it be kept intact. Very justifiable when the gift practically constitutes a department—like the Heber Bishop jades in our Metropolitan Museum—usually such conditions are, frankly, onerous; they interfere sadly with the general classification of the museum. Furthermore, the stipulation is almost always futile. Collections transferred to public galleries quickly lose all personal quality. Visitors rarely know by the generosity of which donor they are profiting as they pass through a dozen such bequests. In fact, a label on each object indicating the giver is a far better reminder to posterity than the unheeded signboard by the entrance door. Accordingly Mr. Freer's gift has this hint for generously minded art collectors, that if the personal milieu of a collection is not so rare as to be worth preserving in a separate institution, the gift to a public museum should in almost all cases be unconditional.

We hope to see these smaller institutions multiply, and we believe that only pedants will take the other view. So inevitable is the drift towards the great museums that there is some danger that the sense of a finer and more intimate delight in works of art may be weakened. The museums have their very necessary and useful function. To students they are indispensable, to the greater public a means of education and enjoyment. But in all matters of arrangement of exhibits the final result is perforce a compromise between considerations of space, scientific classification, and æsthetic effect. Thus, Director Madrazo of the Prado boldly hangs his two Watteaus in the Titian room, where they shine; otherwise they would be lost in their logical place among the mediocrities of the French school. Happy audacities of such a sort a great museum can permit itself only exceptionally. In a small personal collection they are or should be the rule. That this is not merely a fine-spun distinction—a whim of preciosity—many can prove from their own experience. One need only recall the little Poldo-Pezzoli collection at Milan, or the residence of the late Gustave Moreau at Paris, in which his visionary imaginings are kept together, or, on a lower level of taste, the possessions of the actor-manager Alleyne, still piously treasured at Dulwich College, to realize that these little museums fill a place left unoccupied by the more catholic collections. The mere quiet of such shrines is an incalculable advantage. Let the art-lover clear his mind of cant and ask himself frankly if the Tribunal of the Uffizi, amid the reigning conditions of touristic tumult, is not precisely the place he would most resignedly never enter again. By such a challenge of the conventions he will effectually plead the cause of the small museum.

In the interest of diversity, then, we hope to see other gifts like Mr. Freer's. Between such small foundations and the great museums there is no rivalry. Each aids the other. And the art life of a city is richer when, beside its great museum, it has here and there many little galleries which represent, not so much art history, as the personal enthusiasms of some collector of taste, and are a kind of visible counsel of perfection to the entire art-loving community.

ITALY'S TRIBUTE TO CARDUCCI.

FLORENCE, January 13, 1905.

Italy cannot be included among the nations that Ruskin reproaches with ingratitude to their great ones during life, as far as her foremost poet and prose writer is concerned, for it would be difficult to imagine what higher honors than those now showered on the living genius could be accorded him had he already joined the mystic realms "where the immortal are." It is not only the fact of the national tribute of 12,000 lire assigned to him as an annuity, besides the ordinary pension due for his forty-five years of teaching as professor of Italian literature in the University of Bologna; it is the spontaneous and almost unanimous enthusiasm that has accompanied the tribute, the universal outpouring of affection, admiration, gratitude, and reverence showered on him from every class and party throughout the peninsula, and, despite the prohibition of Austria, from unredeemed Trieste, that is significant. Remarkable, too, when we recall the many phases through which Carducci's political career has passed. Beginning with his adhesion to the first King of Italy, his "all hail" to the white cross of Savoy in 1859, he represented the national sentiment in those days when the hopes of Italy were centred on the little kingdom at the foot of the Alps, which alone held aloft the Tricolor; whose king, on a defeated battlefield, had seized the tattered banner and refused to surrender it to Radetzki, even as he refused to abrogate the Constitution, although Piedmont was invaded, Alessandria occupied, the capital menaced, the very existence of the little kingdom in peril. Then Moderates and Liberals, Monarchists and Republicans, were of one mind because Unity had at last enshrined itself in the hearts of all. But when, after Cavour's death, the faction that had done little or nothing to ensure national redemption, recognizing as the chief, if not the only, factor the man of the Second of December, bowed servilely to his least behest, shooting down the Liberator of eleven millions of Italians, and later transforming the King of Italy into the gendarme of the temporal power, treating the southern provinces as they had been treated by the Bourbon; then the poet, for whom Italy's national existence, greatness, and nobility were the supreme aims, lashed in poetry and in prose her servile crew, in unmeasured terms, especially after Mentana, when his accusing voice echoed through the land. Then, indeed, he became the object of fear and hatred to the Moderates, every obstacle was thrown in his path; and here the Clericals joined hands with their enemies, for they, too, felt the stings of the author of "Satan," though they never understood its full force or meaning.

After the final entry into Rome, the revolutionary note was modified, but it was not until the Right fell and the old Party of Action came to power that Carducci gave in his adherence to an Italian Government. Meanwhile, for his praises of Mazzini, whom he learned to appreciate all too late, he was by Bonghi suspended from his chair and salary for six months, but such was the adoration of his students that none dared longer to deprive them of their Master. Among the Left he had his special Benjamins, chiefly Cairoli and Zanardelli. Crispi then occupied only a second place in his heart. Bertani, from first to last, he loved and esteemed. But, gradually, one and all failed to satisfy him in view of their dissensions, their jealousies—above all, their neglect of the suffering and overburdened masses, the total absence of popular education, which he had constantly and vehemently insisted upon in speeches ever since 1862. And if he pleaded almost without hope with conservatives in power, when the reformers came to the helm he challenged them in far severer terms. Sadder and severer grew his reproaches as the seventies passed and the incapacity of his beloved Cairoli, the supineness of all the ministers of foreign affairs, left Italy at the mercy of France, hostile under MacMahon, impertinent under Decazes, insolent under Gambetta, perjured in Tunis as of old in Rome. In his wonderful prose lyric on the day after Garibaldi's death, Carducci stops short, stung by the contrast of the ignominy of the present with the glories of the past; and, after a terrible accusation of all parties and sects then ravaging Italy, closes with this pathetic appeal:

"In the times of Homeric Greece, around the pyres of their heroes their countrymen and comrades flung into the flames all that was dearest to them; some sacrificed their horses, some their slaves, some themselves. I do not ask such a sacrifice from the Italians. I know that parties must exist because they are necessary to liberty. But I ask all parties, from the monarchical, which claims Garibaldi as its ally, to the Socialists, who claim him as their leader and abettor, to sacrifice on his funeral pyre, whose flames face the sea,* not their dearest treasures, but every base thing belonging to them. If this they do, we may hope that in the days of trial and of danger (and

*When Carducci on the 4th of July, 1882, spoke thus, no one doubted that Garibaldi's last commands would be obeyed and his body burned, pagan fashion, in Caprera, facing the sea. His family, friends, and comrades disobeyed, and bitterly Carducci reproached them. His allusion to the Socialists' claim of Garibaldi for their own is due to Garibaldi's still repeated sentence, "Socialism is the sun of the future."

these seem near and mighty), the spirit of Garibaldi may return, leading the van of our armies once more to glory and to victory."

Thus as ever Carducci proved himself member of no party, intent only on purging his country of all her weakness and wickedness, on uplifting her to the ideal of goodness, to real noble and lasting greatness.

Once more, and for the last time, we think, in May, 1886, Carducci launched bitter and scornful condemnation on Depretis in the last year of his ministerial life, pledging himself as he had promised Bertani, just deceased, to take his seat in Parliament if elected in Pisa, because a lofty idea of duty impelled him to go and combat the disastrous system of government which, declining all responsibility, claimed to guide the nation whithersoever and with whatsoever means it might choose. After enumerating the sins of omission and commission of the "unscrupulous old cynic," he denounces the Triple Alliance, which compels Italy "to sacrifice a portion of her internal liberties, to fling to the winds her historical ideality, to set the democratic sign and seal to mediæval conceptions and plans, without a guarantee for the present or a pledge for the future." Then he charged Depretis with the guilt of squandering life and treasure in Africa, while portions of Italian soil were unredeemed and Italian multitudes were perishing for want of labor and of bread.

Depretis died, and Crispi, from 1887 to 1891, appeared to Carducci the redeemer of Italy at home and abroad. At home he undoubtedly was so, for he fulfilled all the pledges given by the Party of Action in opposition, and he was not responsible either for the Triple Alliance, which he could not dissolve, or for the African policy, which he did not initiate. But in his thick-and-thin championship of Crispi during the revolts in Sicily and of the delirious dream of empire in Africa, Carducci offended every party in Italy by his speeches and his prose writings, especially by his poem to Crispi's daughter (January 10, 1895).

While far from endorsing his incentives to imperialistic tendencies, partial and transitory as fortunately they were, we refer to them to show that Carducci has never sought popularity or applause, has often and often repelled applause; and, looking through the splendid new volume of his prose works which includes the principal (though many gems are omitted despite the 1,500 pages), one is compelled to recognize that Carducci has been consistent and tenacious throughout—never a partisan save of Italy, always the champion of what seemed to him at the time most beneficial, most conducive to Italy's taking her place as a factor of peace and progress among the nations of Europe. It is the recognition of this, his guiding star, as much as his countrymen's pride in his genius, that explains the passionate enthusiasm that accompanies the national tribute which accords posthumous honors to the living man beloved. It is true that though the proposal was received with acclamation, there were found in the urns of the Chamber of Deputies two and twenty hostile votes. Were they deposited by the Socialists or by the Clericals? Probably by some of both parties. The revolutionary Socialists know that they have in Carducci a stern, firm, immutable opponent, though the more one reads and rereads his prose works, the more one realizes how constant and tender has been his solicitude for the redemption of the masses from the depths of misery and ignorance in which they are still sunk. Speaking in 1873 to the League for Popular Instruction, he noted with sorrow that one to whom a prize had been adjudicated could not be found to receive it.

"He was a shepherd who, during the winter, while tending the flocks he had brought from the mountains to the plains, attended the evening school of Calamosco with such diligence as to deserve the prize. But he returned, and we cannot give it to him, as he left not a trace. We can, however, rejoice that, during his summer sojourn in the mountains, his days will be less lonely and wretched since he can find consolation in books that may teach him hope and good things."

His stanzas entitled "Carnival," so beautifully rendered by Frank Sewall, reveal the passionate sympathy of the poet for the weak, the suffering, the abandoned millions, his indignation against the cruel indifference of the wealthy and the powerful for these human outcasts in their inhuman wretchedness. "Why," we asked him once, "have you given us no more of those all-powerful protests and appeals?" "Because," he answered, "I fear to stir up in these unhappy ones impotent vengeance, resolves which can only add to their wretchedness by alienating the classes who begin to realize their wrongs and to recognize their rights, and to throw them into the arms of anarchists who would divide this Italy of ours, still so weak and isolated, and bring about a fratricidal war in a nation that must remain united against her many and most powerful foes." For his bitter censures of the revolutionary Socialists he was in 1899 excluded from the provincial and municipal councils in Bologna, and his defiant strictures on their methods assuredly did not conciliate them.

Of the hundreds of articles and speeches which all exalt Carducci's name, a few are worth recording. That of Orlando, in introducing the bill, was reverent as it was affectionate.

"This measure," he said, "will ensure to our aged poet rest and tranquillity, enhance the prospect of fresh works of beauty; and the glorious singer of regenerated Italy, the stanch and trustful prophet of her lofty destinies, the kindly pleader for a happier future for weary human workers, will hear in the homage of this assembly the admiring and grateful voice of future idealists. . . . Regret as we must the loss of the great Teacher who, from his chair in Bologna, has, by the austerity and solidity of his learning, the geniality emanating from his lofty genius, given fresh life and vigor to the intellectuality of all scholastic institutions, he will not cease to educate us in his retirement from the University. This master of masters will yet give us fresh poetry and prose which will compensate us for the silence of his actual voice in the University. The future historian of new Italy, writing of the great century whose ideas and aspirations we inherit together with the gigantic results of their heroic deeds, will meet at every step this exalted figure, this poet, author, erudite, artist, and professor, who sums up in his laborious career the thought of his time in all that is loftiest and best; whose voice has echoed through the world, gaining once more the admiration of foreign nations for Italy.

"But at this moment it is his work as educator that chiefly occupies us, as the educator of Italian youth in civic virtue, in probity of intellect, in contempt for all hypocrisy, for all shams or falsities. His constant effort has been, not only to comprehend and appreciate our great ones in their relations to the times in which they lived, but to keep them pure from imposture in art, in study and in life. His austere methods of compelling conscientious research have radically reformed the mental habits of his students; his stern prohibition of rhetorical improvisation has forced them to observe the rigid laws of rectitude and of sincerity—laws which extend to individual character and to social relations. His sovereign art, while it disproved the hasty affirmations of superficial observers that all poetry was dead, grew and purified itself in his intense love of country, in religious obedience to the law of progress, in filial reverence for Nature, whose beauty he worships, whose profound mysteries he has transfused into his potent verse. The soul is retempered and the mind embraces ever wider horizons as he leads us up to some sublime Alpine height, and in his *Carmi* future generations also will sun themselves in his vivifying faith in the nobility of human destinies, in the perfection of humanity's ideal."

In speaking of Carducci's austere methods and his disdain for rhetorical improvisation, the Minister of Public Instruction touched one of the keynotes of the Master's educational system. Woe to the student who dared to send him a poem or an article for inspection. In one term he must have received several, for in an irate mood he mocked and scoffed at his class, saying, "If I knew the mothers of these silly boys I would recommend them to take off their slippers [here a pantomimic act] and send them supperless to bed!" And in one of his "furious soliloquies" (published in 1885) he writes:

"I have been thinking of my bill for classical instruction. Here is the thirtieth article: 'When any pupil of any professor of Italian literature shall print a poem or prose article within three years of taking his degree, that professor shall be deprived of his chair.' Article 31st: 'Any professor whose pupil shall print prose or poetry while yet a student, shall be beaten with rods.' "

Very touching was the speech of the venerable Senator Finale in presenting the measure to the upper house.

"He rejoiced in the good fortune that had fallen to the committee of which he was chosen reporter. A tribute similar to the one now proposed had been paid to Alessandro Manzoni by Rattazzi, minister during Victor Emanuel's dictatorship; but the vote of the nation represented in her Parliament, now that Italy is one, free and independent, with her seat in Rome intangible, receives additional solemnity and will be held by our poet as a greater prize than the crown awarded in other days to Petrarch in the capitol; and the applauding voices of the nation will echo beyond mountain and sea wheresoever the language of the *sì* is spoken. From Carducci, teacher, author, poet and prose writer, a new life and school of literature takes initiative. In his works, modern ideas and sentiments appear reclothed in marvellous classic forms; the noblest traditions of the past present themselves with audacious modernity. Even old men like myself, who were not formed in his school, stand entranced before the insuperable manifestations of his genius and his art."

Not a dissenting voice was there in the Senate. One voice, one vote, and that acclaimed in silence.

Though it was known that Carducci's resolution to resign his chair was irrevocable, it was thought just possible that this national tribute might induce him to retain the chair, allowing a substitute to give the lectures when the fatigue was too much for him. The entire body of the professors, all his adoring colleagues, entreated him not to abandon them, to give even

one lecture during the year, to deliver at least the inaugural address; but this now could never be. Since his health began to fail in 1898, he has for weeks together entrusted his students to his best beloved disciple, Severino Ferrari, who for five years, when professor of Italian literature in the Female University here in Florence, used to go every week to replace his worshipped master, whom he also always assisted during the arduous examinations. In 1902 Ferrari was transferred from Florence to Bologna as professor of stylistics, and this irreparable loss to the noble band of Italian women who desired the highest education that Italy can give, was not mitigated by their joy in the beloved professor's personal advancement. For his health failed almost immediately—so seriously that he could no longer assist his master, and is at present compelled to desist from giving his own lectures. To no other hands would Carducci have confided his scholars; as he never allowed a lecture to be missed unless detained at Rome by his duties as Senator or member of the Supreme Council of Public Instruction, he had to choose between resigning his chair and abstaining from all other tasks, even that of revising and reëditing his former works. Hence his brief demand for permission to retire from his professional duties, enclosing a certificate from his family physician that they were indeed too heavy for his enfeebled health. Fortunately, though delicate, he is stronger than he has been of late years; and that his intellect remains lucid and bright as of yore, his articles on "The Development of the Ode in Italy," on "The Spring and Flowers of Lyrical Poetry," and, in this January's *Antologia*, an article on Dante's sonnet "Tre Donne," give ample proof. Naturally the surprise, gladness, and gratitude aroused by this universal homage have tried him not a little, but the devoted care of Donna Elvira and his family has prevented any baneful effects.

Beyond all praise has been the conduct of his admirers and friends in the town and province of Bologna, and from provinces further off. Instead of going separately or collectively to give him New Year's greetings, all agreed to send letters, cards, addresses, and happy returns to the editor of the *Resto del Carlino*, the Bolognese newspaper that has been faithful to him forever and a day. These, forming a monumental pyramid of love, were taken to him on New Year's day, telegrams raining down meanwhile: a pleasant opening, this, of 1905, and not alone for the recipient of all this genuine sympathetic homage.

J. W. M.

TRISTAN AND ISOLDE.

PARIS, January 13, 1905.

I will not dwell on the great revolution which has taken place in the French mind on the subject of the music of Richard Wagner. I still remember the evening on which his "Tannhäuser" was played for the first time at the French Opéra—it seemed as if Wagner, having suffered a crushing defeat, could never be heard of again; but the defeat was unjust, and Wagner is now the undiscussed representative of a musical school which has fanatical adepts.

It would at one time have seemed impossible to play "Tristan and Isolde" on the French stage; but this extraordinary musical drama draws now an enthusiastic audience to the Opéra, and books are written on the admirable legend which was used by Wagner. This legend has been reconstituted from fragments of the French poets of the twelfth century and of their foreign imitators, and has been printed for the first time in a splendid volume, 'Roman de Tristan et Iseut,' for a limited number of bibliophiles, and illustrated with one hundred and fifty colored engravings. The author of this fine work, M. J. Bédier, had already published a cheap and popular work on the same subject. This volume has a preface written by M. Gaston Paris, which is very interesting. He tells us that "M. J. Bédier is the worthy successor of the old *trouvères*, who tried to decant into the light crystal of our language the intoxicating beverage in which the Cornwall lovers found one love and death," by narrating "the marvellous history of their enchantment, their joys, their sufferings, their death, as, coming out of the depths of the Celtic fantasy, it pleased and troubled the soul of the French of the twelfth century."

There exists no complete French embodiment of the legend; if there had been one, M. Bédier would have contented himself with giving a faithful translation of it in modern French. We possess only fragments.

"Of the romances of Tristan," writes M. Gaston Paris, "known to have existed, and which must have been of great length, those of Chrétien de Troyes and of La Chèvre have entirely perished; of Béroul's romance there remain three thousand verses; as much remains of the work of Thomas, and fifteen hundred verses of an anonymous work. Then we have foreign translations, three of which give us pretty exactly for the substance, but not for the form, the work of Thomas, and one of which represents a poem very similar to the work of Béroul. We have here and there allusions, often valuable, little episodic poems, and finally the undigested prose romance, in which we find, in the midst of a medley constantly increased by successive writers, some remains of lost versions."

M. Bédier chose to revive for us the legend of Tristan in its oldest form, or at least in the oldest to be found in French. He therefore began by translating as faithfully as possible the fragment of Béroul, and to this he has added what he thought most appropriate, much like a sculptor who, discovering the Venus of Milo, should undertake to add the missing arms to the body. The difficulty lies in finding an exact harmony between all the parts of the statue. M. Bédier, in the opinion of M. Gaston Paris, who was a very competent judge, has solved the problem satisfactorily; he has, at the end of the nineteenth century, succeeded in giving us a poem of the end of the twelfth century.

"By combining the indications, sometimes very slight, of the French *conteurs*," says M. Paris, "we succeed in perceiving what this savage poem might have been to the Celts, always surrounded by the sea or the forest, the hero of which, demi-god rather than man, is presented to us as the master, or rather as the inventor, of all barbaric arts, a killer of stags and bears, an incomparable wrestler, an audacious navigator; knowing how to play on the harp, how to imitate the song of every bird; and, with all that, invincible in battle, a tamer of monsters, protector of his faithful friends, merciless to his enemies, living an almost superhuman life, a constant object of admiration, of devotion, of envy."

This type would not be complete if love had no part in it; but this word must be explained when we talk of the epic poems of the times of Tristan and Isolde. In all the literature of that period, love is not treated as a passion so long as it is governed by duty; it is a passion only when it is outside of established rules; it then acts, as it were, as a force no longer controllable by the will, and consequently it becomes a dramatic element, having the character of fate, and naturally associated with the idea of death. Such is the character of the passion which devours Tristan and Isolde, and which connects in their legend the ideas of love and of death. This connection takes material shape in the philter which plays such an important part in this drama of the twelfth century. The ancients also used the philter in their mythology; but their philters were employed only to induce love, and were not at the same time instruments of death, at least not of necessity. Love and death were not profoundly related in the optimistic mind of the Greeks. M. Gaston Paris tells us that with the Celts "the idea of symbolizing involuntary, irresistible, and eternal love in a beverage whose action (and herein it differs from vulgar philters) lasts during the whole of life and even persists after death, invests the history of the lovers with its fatal and mysterious character; this idea evidently had its origin in the old Celtic witchcraft."

The notion of the fatality of love, placed outside and above all laws, is the commanding inspiration of the poem of Tristan and Isolde. Love is thus purified by suffering; and it is no wonder if the poem became so popular, and if, in the admirable language of music used by Wagner, it speaks to so many hearts.

"In the midst," says M. Gaston Paris, "of the ordinary frailty of human affections, of constant disillusion, this pair, fettered from the beginning by a mysterious bond, tossed by many storms, and resisting their force, trying in vain to recover their freedom, and finally drawn together in a last and eternal embrace, appeared and still appear one of the forms of the ideal which man is never tired of placing above the real, and of which the multiple and opposite aspects are only the various manifestations of his obstinate aspiration towards happiness."

The music of Wagner, who drew out of the poem the essence which is everlasting and is as well suited to our time as to old times, is also a philter. It may be thought a poisonous doctrine to place love outside of and above all laws, and almost to sanctify it by the idea of death. Death is the end of all things human, of virtue as well as of vice; and M. Gaston Paris writes truly: "There is no ideal of which the charm has not its danger. . . . We must, when we pass the grotto of the Sirens, tie ourselves firmly to the mast, without renouncing audience of the divine melody which speaks to mortals of superhuman felicities." The poem, however, as M. Bédier gives it to us in its exact original, is so different from our modern life that it can hardly be considered an incentive to our passions; it differs as much from a modern picture as a mediæval glass window, with its straight lines and stiff attitudes. It is a document, and, as such, throws much light on the manners and the feelings of a very distant period, and of a race whose characters have been slowly altered by the work of time and by ethnical mixtures.

It is impossible to give an account of the poem; it must be read. All its beauty is in its development and its details. There is still room in it for many musical interpretations. The imaginative genius of Wagner seized upon only one of its episodes (the most striking, to be sure).

Correspondence.

A BOOK FROM THE LIBRARY OF THE EARL OF LEICESTER.

TO THE EDITOR OF THE NATION:

SIR: There was sent to me, from Chicago, in 1903, for identification, 'La Vita di Carlo Magno Imperadore, scritta in lingua Italiana da Petruccio Ubaldino Cittadin Fiorentino. [John Wolfe's device of the seeding fleur-de-lis, flanked by his motto, *Ubique florescit.*] Londra: Appresso Giouanni Wolfio Inghilese. 1581. [4to, pp. 125, A through Q.]

'La Vita di Carlo Magno' has long enjoyed among bibliophiles the reputation, given to it by Ubaldini in his Epistle Dedicatory, of being the first Italian book printed in England. It is not, however, the first English imprint in Italian, having had several less ambitious forerunners. Two of these tracts, previously printed in London, I have recorded in my 'Elizabethan Translations from the Italian' (pp. 360-1), and I shall be able to add two more to my revision of that work, now in preparation.

The little quarto is perfect, although it shows the marks of time. These marks are three in number: all the bands but one are loosened from the back; the clasps are gone; and a bookworm has enhanced the romantic interest of the life of Charlemagne by journeying through the wide margins from the back cover forwards, through end-papers and signatures to Signature E. The book is bound in limp white vellum and illuminated in gold, front and back. On the fly-leaf, opposite the title-page, is inscribed, in beautiful Italian script:

All' Ill.mo et Ecc.mo Sig.r il Sig.r
Conte di Lecestrioré
Petruccio Ubaldino, in riconoscenza
dicerta, et nó mai dimenticata obligatio:
né, et di douuta humiltà desidera
prosperità.

On the title-page, under the date, there is written "Elizabeth R."

I was asked for my opinion of the genuineness of the inscription and the signature. Of the inscription I had no doubt whatever but that there had come into my hands the unique exemplar presented by the author and illuminator to the Earl of Leicester. Of the supposed royal signature I had every doubt, for the following reasons: in 1581, Leicester had been married for three years to Lettice Knollys, Countess of Essex, and Elizabeth was in the eleventh year of those remarkable negotiations known as the Alençon marriage. I know no reason why her signature should be in his book at that time, or later, unless she came into possession of it after his death, in 1588, when she ordered his goods to be sold at public auction in discharge of a debt he owed to the exchequer. 'Nichols's Progresses' affords a curious possible confirmation of this conjecture. It records that in 1588-9 Petruccio Ubaldini gave the Queen, for a New Year's gift, "a book covered with vellum of Italian," for which she returned a gift of five and a half ounces of gilt plate. Ubaldini may have bought in his own richly illuminated book at the Leicester sale and presented it to the Queen.

I have never met with Queen Elizabeth's handwriting *in extenso*, either original or in facsimile, and do not know whether she wrote the old English hand or the Italian script that was displacing it during her reign. Certainly all the facsimiles of her signature I have seen are like those affixed to the Rolls of New Year's Gifts in Nichols. There she signs a bold Italian "Elizabeth R." As is well known, many educated Elizabethans wrote familiarly the old English hand and signed their names in the running Italian script. It is a significant evidence of Shakspere's origin and social status that he never learned to write the fashionable hand. The signature on the title-page of 'Carlo Magno' is written in a crabbed hand, more old English in character than Italian, but not distinctly either. It looks to me like a forgery, and the forgery of some one who did not know that there were two styles of writing in Elizabeth's time, and who attempted merely to make her write an old script.

I therefore advised that the book be sent to the British Museum for expert examination of Queen Elizabeth's signature. This was done through Mr. W. M. Voynich, and I am able to add Mr. Voynich's opinion:

"Ubaldini lived in England at the time of the publication of this book. The publisher, Wolf, was the first man to introduce the printing of Italian books into England, and at the same time published many secretly printed books, like Machiavelli, never giving his name or colophon.

"The British Museum has two petitions by Petruccio Ubaldini to Queen Elizabeth (Lansdowne, 98, v. 175, 180), written, one in 1584, the other in 1594. These documents are written in his hand and signed, and the writing is exactly similar to this dedication in your book, his *u* being specially characteristic. There cannot, therefore, be the slightest doubt but that Ubaldini has dedicated this to Leicester; on the other hand, I am afraid there can also be no doubt that the signature on the title-page is not Queen Elizabeth's. I have compared it with all the Queen's signatures preserved in the British Museum, and they are totally different. This signature is illegible, but apparently contains the name Dyke. It could be any time during the seventeenth century.

"The binding is exceedingly rare, and is one of the earliest specimens of this kind used in England. There is no such specimen in the British Museum."

It would be interesting to discover how this rarest of books found its way to a Chicago dealer. There is pasted on the inside of the front cover the bookplate of the Right Honorable Charles Bathurst. 'Foster's Peerage' records the death of the Right Honorable Charles (Bragge-) Bathurst on August 13, 1831. Was there a signature, Elizabeth R., in 'La Vita di Carlo Magno' when it belonged to the Bathurst library at Lydney Park? When and how were the Bathurst books dispersed?

MARY AUGUSTA SCOTT.

SMITH COLLEGE, NORTHAMPTON, MASS., January 25, 1905.

'ALONZO AND MELISSA.'

TO THE EDITOR OF THE NATION:

SIR: On December 8, 1904, I contributed to your columns a communication on a neglected American author, Isaac Mitchell, whose 'Asylum, or, Alonzo and Melissa,' in two volumes, was published in 1811. This book contained not only the story of Alonzo and Melissa, but a long episode in the style of the eighteenth-century novelists. This episode had nothing to do with the main plot, yet it occupied a large part of one of the two volumes. By omitting the episode, and by judicious condensation, the two-volume 'Asylum' was reduced to a single volume by a certain Daniel Jackson, jr. This revision of Jackson's, under the new title of 'Alonzo and Melissa, or The Unfeeling Father,' obtained an extraordinary circulation, while the 'Asylum,' its original, was not reprinted, so far as I can ascertain.

The earliest copy of Jackson's 'Alonzo and Melissa' that I had discovered was printed in 1824. Mr. Sidney S. Rider of Providence, R. I., has in his possession a copy dated 1811, the very year Mitchell's 'Asylum' appeared. In his *Book Notes* for January 14, 1905, he has published an article in which he attempts to prove that Jackson did not compile his single volume from Mitchell's work, but was the actual author of this novel. On the other hand, he states that Mitchell stole the story of 'Alonzo and Melissa' from Jackson and incorporated it in his longer work. To prove this, Mr. Rider denies my statement that 'The Asylum, or, Alonzo and Melissa,' by Mitchell, was copyrighted by title December 2, 1810. He gives the date as 1811, December 2, in order that Jackson's book, dated 1811, may precede Mitchell's 'Asylum' in date of publication. In that case, Mitchell was the plagiarist.

My authority for the date of the copyright of the 'Asylum' is the notice printed in the book stating that the title was registered for copyright the "second day of December in the thirty-fifth year of the Independence of the United States." This is December, 1810. It is worthy of notice that Jackson's 'Alonzo and Melissa' was never copyrighted, for the simple reason that the book was stolen from Mitchell's 'Asylum,' and hence no copyright could be obtained.

Concerning the date of the publication of Mitchell's 'Asylum,' I stated in my former communication that in the *New York Columbian* for October 9 and 16, the 'Asylum' is advertised as an "American Tale, Founded on Fact, by I. Mitchell." Mr. Rider, who has ventured to dispute my facts without even examining my references, remarks naively:

"The various newspaper notices were mere advertisements inserted by Mitchell. . . . Can a book be printed, with a copyright notice in it, before the copyright was, or is, obtained? Most certainly not. Then how could Mitchell's Asylum have been published or printed in October (1811). . . . It was a downright absurdity."

So far from being notices "inserted by Mitchell," the advertisements in the *Columbian* for October 9 and 16, 1811, were inserted by book dealers, who actually offered Mitchell's 'Asylum' for sale at 128 Broadway and 68 Vesey Street at the price of "$2.50 cents bound, or $2.00 in boards." They speak of the book as a "new novel, just received." On October 31, 1811, the New Haven Circulating Library stated that the 'Asylum' was among the new works added to its books.

As the 'Asylum' was published in Pough-

keepsie, it may have been on sale there before October. We know that it was sold in New York October 9, 1811. Between that date and January, 1812, there was ample time for Jackson to cut down the 'Asylum' and bring it out as his 'Alonzo and Melissa,' dated 1811. Mr. Rider has characterized his own article as a piece of "extraordinary research." It is.

EDWARD B. REED.

YALE UNIVERSITY, January 26, 1905.

OLD EDITIONS FOR NEW.

TO THE EDITOR OF THE NATION:

SIR: Some of your readers have indeed found entertainment in Mr. G. F. Moore's communication in your issue of the 19th. But is there not a pathetic side to it? How long will the "booklovers of America" continue to support these manufacturers of "rare and limited" editions, copies issued for "private circulation only," "the World's Best" this, that, or the other? Evidently, these firms find a ready market for their wares.

Two years or more ago I called attention in your columns to the exploitation, by one of these subscription firms, of Pepys's Diary issued in nine volumes by the Macmillan Company. The firm bought a certain number of copies in sheets, inserted a few illustrations, made the nine volumes into eighteen, and sold them at an enormous price as the "only unexpurgated" edition of the Diary. The case referred to by Mr. Moore seems to be of the same class. Sir Richard Burton published 'The Book of a Thousand Nights and a Night' in ten volumes in 1885-86, and during 1887-88 six volumes of the 'Supplemental Nights.' These sixteen volumes were issued at one guinea each to subscribers, with a distinct understanding that only 1,000 sets would be printed, and there would be no reissue. Four years after Burton's death, in 1894, H. S. Nichols & Co., the London publishers who had printed the original edition for Burton, brought out a "Library Edition," edited by Leonard C. Smithers, in twelve volumes. Some of Burton's original subscribers sought to restrain the publication, on the ground that it was a breach of the agreement entered into by Burton; but the judge before whom the case was brought, decided that the twelve-volume edition was an abridgment of the original edition and could not be held to reduce the value of the latter. The edition referred to in the circular cited by Mr. Moore is probably this twelve-volume abridged edition issued in 1894. The plates in this edition were issued in a separate volume in England.

There has been a facsimile reprint of the original edition in sixteen volumes (Press of Carson-Harper Co., Denver, Col., 1900-01), issued for the Burton Society. I think the cost of this to subscribers was $90, but the price has fallen, and a set sold last year brought only $40.

Bookbuyers should look with suspicion upon these "confidential" circulars, and at least make inquiry at their Public Library before walking into the net spread out for them.—Very truly yours,

LOUIS N. WILSON.

LIBRARY, CLARK UNIVERSITY,
WORCESTER, MASS., January 24, 1905.

THE FIRST EDITION OF PILGRIM'S PROGRESS.

TO THE EDITOR OF THE NATION:

SIR: Your reviewer of White's Bunyan, on page 79 of your current issue, says that "no single copy" is known of the *princeps* of Bunyan's Pilgrim's Progress. Perhaps he would care to know that I have seen and carefully examined more than "a single copy," and that two are in Greater New York.—Yours very truly,

VICTOR H. PALTSITS.

NEW YORK PUBLIC LIBRARY, January 27, 1905.

Notes.

Macmillan Co.'s spring list contains, among other works not heretofore announced by us, 'A History of the United States since the Civil War,' by William Garrott Brown; 'Southern Writers,' selections in prose and verse, by Prof. William P. Trent; a 'History of the Pacific Northwest,' by Joseph Schafer, Ph.D., of the University of Oregon; Lives of the poet Bryant, by William Aspenwall Bradley, and of the historian Prescott, by Prof. Harry Thurston Peck; 'The Life and Writings of Benjamin Franklin,' in ten volumes, by Prof. Albert H. Smyth of the Central High School, Philadelphia; a new volume in the series "The History of American Art," edited by Prof. John C. Van Dyke, viz., 'The History of American Painting,' by Samuel Isham; 'Character of Renaissance Architecture,' by Prof. Charles H. Moore; 'A Grammar of Greek Art,' by Prof. Percy Gardner; 'The Art of the Musician,' by Henry G. Hanchett; 'Lectures and Essays by the late Rev. Alfred Ainger'; 'A Middle-English Reader,' by Prof. Oliver F. Emerson; 'On Becoming Blind,' advice for the use of persons losing their sight, by Émile Javal; 'Tibet and Nepal,' by A. H. Savage Landor; volumes iii. and iv. of Herbert Paul's 'History of Modern England'; and 'What is History?'—five lectures on the modern science of history, by Prof. Karl Lamprecht.

The Open Court Publishing Co., Chicago, have nearly ready 'Species and Varieties, their Origin by Mutation,' by Hugo de Vries, professor of botany in the University of Amsterdam, edited by Dr. Daniel T. MacDougal.

McClure, Phillips & Co. announce for speedy publication 'Alaska and the Klondike,' by J. L. McLain; and 'Russian Literature,' by Prince Kropotkin.

To their "Makers of Canada" series Morang & Co., Toronto, will shortly add Mr. Narcisse E. Dionne's Life of Champlain.

With but two of the ultimate six volumes of the 'Diary and Letters of Madame D'Arblay,' edited by Austin Dobson, before us (Macmillan), we can say no more than that the edition is admirably bold in its letterpress, and is illustrated with portraits, views, and facsimiles of a high order. The final volume will contain wholly new appendices, on the matter which could not be digested in Mr. Dobson's notes.

The Oxford Shelley ('Complete Poetical Works of Shelley, including materials never before printed in any edition of the poems, edited with textual notes by Thomas Hutchinson, M.A.'), issuing from the Clarendon Press, attains its principal end and aim in setting forth an authentic, complete, and accurately printed text, a task of no little difficulty even though the editor falls heir to the labors of a long line of devoted predecessors. He follows Forman as the main guide of his discretion. Thus, he places "The Daemon of the World" at the head of the works, and relegates "Queen Mab" to the Juvenilia. In spelling, pointing, and capitalization he holds a place between Forman and Dowden. He gives, like Woodberry, the bibliographical and textual history of each poem with the poem, and includes Mrs. Shelley's invaluable notes; a few textual comments are added at the end of the volume. He follows both Forman and Dowden in preferring occasionally the less familiar and, as some will think, inferior forms of popular lyrics, such as "Love's Philosophy" and "The Indian Serenade," on the authority of manuscript variants. The new material consists exclusively of the corrections and new lines deciphered by Mr. Locock from the Bodleian MSS., and the poems of Victor and Cazire edited by Dr. Garnett.

Mr. Locock's labors on the Bodleian MSS. ('An Examination of the Shelley MSS. in the Bodleian Library, being a collation thereof with the printed texts, resulting in the publication of several long fragments hitherto unknown, and the introduction of many improved readings into "Prometheus Unbound" and other poems, by C. D. Locock, B.A.'), also printed by the Clarendon Press, form quite the most important contribution to Shelley's text since the 'Relics of Shelley,' by Dr. Garnett. He has not only perfected the text of "Prometheus Unbound" appreciably, but he has much enhanced the value of "Marenghi," "Prince Athanase," and "The Witch of Atlas," besides adding considerably to the fragments; and he attempts an interesting metrical reconstruction of the "Ode to Naples" and the poem "To Constantia." The carefulness of his work, and its elaborate and precise presentation, reach the highest standard of conscientiousness and excellence, and his familiarity with the text-history is complete; he gives Zupitza full credit for his earlier examination of the MSS.; and his results are upon such a scale of minuteness and intricacy that no editor can appropriate them. The volume itself is indispensable to students of the text of Shelley.

For a summer or two, devotees of the so-called "Lake Poets" might profitably turn their pilgrimage away from Grasmere and Winander to a corner in southwestern England, among the Quantock Hills. Here the friendship between Wordsworth and Coleridge was cemented; here their theories of poetic art were elaborated; and here the "Lyrical Ballads," the first concrete expression of those theories, were in large part suggested and composed. 'The Quantock Hills, their Combes and Villages,' by Beatrix F. Cresswell (London: The Homeland Association), though an unpretending guide through a region little known to tourists, illuminates certain early phases of "Lake Poetry" that have scant connection with lakes in the North, much with rustic types, hilly landscape, and glimpses of the sea in Somerset. Could this inviting booklet for a time divert Matthew Arnold's "pilgrims" to Rydal Mount into the road towards Nether Stowey and Alfoxden, Wordsworth would not lose, and Coleridge would gain, in general appreciation,

The admirable illustrations, which include Wordsworth's temporary home at "Alfoxton" and Coleridge's cottage at Stowey, enhance the value of a text not free from slips, yet on the whole highly commendable. The author underestimates the number of Wordsworth's references to Quantockian scenery; her suggestions on local allusions in "The Ancient Mariner" are of value.

Quintin Hogg (1845-1902) was a manly and useful Englishman, honored as the founder and supporter of the Polytechnic Institute, formerly in Long Acre and now in Regent Street, London. A man of active habits and much travel, his constant interest was in the boys whom he rescued from slums and often sent to America. His life, written by his daughter, published by Constable & Co., and imported in a second edition by E. P. Dutton & Co., is devoted principally to this philanthropic work. His Eton schoolmate, the Duke of Argyll, contributes a preface and a "quatorzain," but the book is needlessly long, and is disfigured by numerous exclamation points. On page 88 we notice a queer story about Mr. Hogg's chief American friend, Dwight L. Moody, who in 1875 was to hold a meeting at Eton. "The authorities took alarm at the prospect; one of the clerical dignitaries at Windsor even went so far as to assert that 'the American' was only coming to preach Republican doctrines, and asked that a reinforcement of troops should be sent in readiness to defend the Castle! The dispute waxed so hot that a question was asked in the House of Lords on the subject."

Few objects easily obtainable for study with the microscope begin to compare in interest with the minute plants found in fresh water. For students and amateurs in the British Isles, Prof. G. S. West, of the Royal Agricultural College at Cirencester, has prepared a convenient handbook on these plants—'A Treatise on the British Freshwater Algæ' (Cambridge [Eng.]: University Press; New York: Macmillan). The work has been thoroughly done throughout, and its value is greatly increased by an exhaustive index. The plates are sufficiently characteristic for most identifications, and the descriptions and keys are good.

In 'The Book of Topiary' (John Lane) Messrs. Curtis and Gibson have given an interesting account of formal pruning of trees and shrubs. The carving of graceful branches into stiff, grotesque imitations of other things, quadrupeds, birds, fishes, and even other plants, belongs to those recurrent periods in urban and suburban life when nothing is satisfying except artificiality. At the present moment, when many of our newly rich do not know how to spend their money or to pass their time, the so-called Italian garden opens great possibilities for useless expenditure and empty results. On the grand scale the formal garden is a thing of dignity or of absurdity, depending upon the constructive or destructive genius of the landscape architect. On the small scale the pleached alley and the tortured yew are always ridiculous. But, whether grand or minor, the formal style has its advantage, namely, that it costs beyond reason, and therefore counts for much in our modern life. To meet these absurd demands, the authors have gone quite halfway. We imagine them to be mild practical jokers, laughing in their sleeves as they try to reconcile these tasteless forms with good taste. They know that these horrible shapes have been banished from good landscape architecture over and over again, but they know, too, that grotesqueness will now and then be demanded wherever there is money to spend.

The *Geographical Journal* for January opens with the suggestive paper read at the St. Louis International Congress of Arts and Sciences by Dr. H. R. Mill on the present problems of geography. These are: its definition; "the wiping off the globe the words *terra incognita*"; a map of the earth's surface, including the sub-aqueous features; a definite terminology; and an exhibition of the relations of the forms of the earth's crust to the distribution of moving things. This he hopes will succeed in determining the influence of surface forms on the mental processes, as, for instance, "the relation between the poetry or the religion of a people and their physical surroundings." Incidentally he commends the United States Government reports as furnishing "almost an ideal geographical description" of the country. A description of the Victoria Falls of the Zambesi, with especial reference to the geology of the region, by Mr. A. J. C. Molyneux, is illustrated by some remarkable photographs. In one is shown the ever-present rainbow, which is such a characteristic feature of the scenery that the native name for the falls, according to Dr. Livingstone, is Seongo or Chongwé, "the place of the rainbow." They doubtless believed that here "all the rainbows of the world must come to play in the sunlight, before they follow the thunderstorms across the land to bless the rain-chilled beasts and birds." Mr. Ellsworth Huntington contributes an account of the mountains of Turkestan, the result of investigations made in 1903 under the auspices of the Carnegie Institution of Washington. Among the distinctive characteristics of the region is the abrupt contrast of the southern and northern slopes of the hills, the one barren of vegetation, the other wonderful for the variety and beauty of the flowering plants, which are "known to the world as garden products, but here grow wild."

The most noteworthy article in *Petermann's Mitteilungen*, number eleven, is on the basin of the Rio Juruá, a southern tributary of the upper Amazon. It gives the main results of investigations into its fauna, flora and inhabitants made by an expedition sent out by the State Museum of San Paulo. A great industrial future is prophesied for it on account of its rich rubber product. Other subjects treated are the evidences of a prehistoric ice age in the Peruvian coast mountains, the Pomeranian lakes, and the central highlands of the Chinese province of Shantung, of which a map is given.

The educational progress of China has been remarkable during the past year, through the increasing realization of the paramount need of adopting Western methods. In the capital cities of fifteen of the eighteen provinces there are provincial colleges, says the Pekin correspondent of the London *Times*, "while primary and secondary schools, mechanical schools, agricultural colleges, and police and military schools are springing up all over the Empire." This intellectual awakening is also shown by the fact that there are now one hundred and fifty-seven daily, weekly and monthly journals, which discuss public questions with growing intelligence and marked courage and independence. A few years ago there were only seven Chinese newspapers. The translations of Western literature are being more and more widely diffused, and thousands of the natives are studying the English language. There are also 1,753 Chinese students in Japan. During the past year the mail matter passing through the 1,192 post-offices increased from 49,350,000 pieces in 1903 to 72,150,000.

The status of woman in India has been advanced a step by the recent Government appointment of Miss Cornelia Sorabji as legal adviser to the Bengal Court of Wards. She is an LL.B. of Bombay University, and the first female native of India to qualify for the bar. Her appointment will enable *purdah* ladies to confer about their legal affairs with a trained lawyer of their own sex, to whom they can speak face to face without the intervention of a screen.

The Circolo Matematico of Palermo offers for the fourth International Mathematical Congress to be held in Rome in 1908 a special prize, consisting of a gold medal and 3,000 francs, for the best work showing advancement in the study of leading algebraic problems. The works may be written in Italian, French, German or English, and must be ready by September 1, 1907.

The Baltimore Association for the Promotion of the University Education of Women will make its customary annual offer of a fellowship worth $500 for the year 1905-1906, with a preference in the award to women from Maryland and the South. Applications should be presented before April 12. The Secretary of the Association is Dr. Lilian Welsh, the Woman's College.

—The contributions of Andrew D. White to the *Century* have become for the present easily its most distinctive feature. His February paper is devoted exclusively to a characterization of the German Emperor, who may well be pleased to find his own cause, and that of an intelligent sympathy between the two peoples, presented to American readers by a pen so effective and so friendly. Many will feel disposed to insert a question mark after Dr. White's assumption that Germany is and must ever be essentially an armed camp, dependent for its very existence upon its military efficiency—an assumption upon which a certain apparent arbitrariness of the Emperor in military matters is explained and excused. Incidentally, the writer expresses a deep desire for three things from abroad to supplement American civilization: "from Great Britain, her administration of criminal justice; from Germany, her theatre; and from any or every European country, except Russia, Spain, and Turkey, its government of cities." All who are interested in the stage and its possible improvement and utilization as a factor of real value in social progress will find extremely suggestive reading in his paragraphs on the German theatre and the Emperor's relation to its development. Other writers present interesting descriptive matter on the Florida Everglades, color effects at Vesuvius, and the park system in process of development in Chicago. The editor takes advantage of the present confused tariff situation to put in a few vigorous strokes against the

absurdity of the tariff on books and works of art.

—'The Great Frenchman and the Little Genevese' (Putnams) is a translation by Lady Seymour of Étienne Dumont's 'Souvenir sur Mirabeau.' This celebrated book, of which both Carlyle and Macaulay have written, now appears in English for the first time, although its author died in 1829 and the date of publication was 1832. Lady Seymour has borrowed from Carlyle the phrase which forms her title, but we cannot think that she has done well to emphasize in this way the mistaken idea that Dumont was a French Boswell. She herself, as one can see from the preface, does not underrate the talents of her author or the excellence of his character. Dumont was beyond question an acute, disinterested and lovable man, whose qualities have received very scant appreciation from Carlyle. Mirabeau was a genius, and Dumont, his friend, had no intention to belittle him, but it was part of the orator's gift that he could assimilate ideas rapidly and get other people to work for him. According to Carlyle, Dumont's book created the impression "that in fact this enormous Mirabeau, the sound of whom went forth to all lands, was no other than an enormous trumpet or coach horn of Japanned tin, through which the dexterous little M. Dumont was blowing all the time and making the noise!" This passage is absurdly unjust to the biographer. Dumont, in the early part of his life, contributed his services to Mirabeau as unselfishly as he contributed them at a later time to Bentham. There are few examples in literature of an equal unselfishness, when we consider the real talent of the man who consented to make himself the interpreter of others. Macaulay well knew the impression left by Dumont upon the leaders of the Whig party in England, and was really paying a tribute to the judgment of Fox and Sir Samuel Romilly when he wrote: "M. Dumont was one of those persons the care of whose fame belongs in a special manner to mankind, for he was one of those persons who have, for the sake of mankind, neglected the care of their own fame. . . . With every right to the head of the board, he took the lowest room, and well deserved to be greeted with, 'Friend, go up higher.'" Regarding Mirabeau we need say nothing, and of this memoir we shall only observe that it is among the indispensable narratives of the early Revolution. Lady Seymour has included practically the whole of the text in her translation, the only omissions being part of an unrevised chapter and the conclusion of the work, which deals wholly with the affairs of Geneva. Dumont's own portrait, as given here, is most interesting, but a much better likeness of Mirabeau might have been found in the portrait belonging to Bowdoin College.

—Professor Jebb's edition of Sophocles is so famous both for scholarship and for style that every one will welcome the appearance as a separate and handy volume of the English translation—"The Tragedies of Sophocles,' rendered into English prose by Sir R. C. Jebb (Macmillan). What Butcher and Lang have done for Homer, Sir Richard Jebb has done for Sophocles. Like them he has felt that modern English is an inadequate clothing for the thoughts of a Greek poet, and the sonorous ring of his prose takes us back to the days of the Authorized Version. The finest piece of translation out of the seven is that of the "Trachiniæ"; the easiest to read is that of the "Philoctetes." In the others the average reader will regret that no notes are supplied, as he will meet with many obscure allusions, hard to unravel. With the aid of a classical dictionary he can ascertain the stories of Phineus, Megareus, Telamon, Myrtilus, and the like, though he may wish that the trouble had been spared him. But he will need a knowledge of the original to understand the play upon words connecting Thebes with Bacchus, Ajax with mourning, and Eurysaces with a shield; the epithets of Morian as applied to Zeus, and Apian to the Peloponnesus; the references to legends about the narcissus and the olive; and the full meaning of the Διὸς Ὅρκος, or of the ἄγος involved in neglecting burial rites. He will furthermore find that, from very conciseness, the dialogue is sometimes ambiguous, while its occasional lapses into blank verse will annoy his ear. Still, when, in addition to the high level of the whole, we consider the heights reached by such passages as Antigone's defence, the lamentations of Electra, the farewell of Ajax, or the description of the blind king's end, we shall feel that, in translating these masterpieces of the Greek language, Professor Jebb has come near giving us another in our own.

—At last we have an English translation of the 'Nibelungenlied' which is in every way worthy of the original. Its author, Prof. G. H. Needler of University College, Toronto, is to be congratulated upon the success of his painstaking, conscientious, and well-directed work, and the publishers (Henry Holt & Co.) deserve thanks for the handsome and appropriate setting which they have given to it. What distinguishes this translation of the great German epic from all previous attempts is, in the first place, the faithful and happy reproduction of its metrical form. Even Lettsom, perhaps the most successful of Professor Needler's forerunners, omits in most cases the rhyming of the cæsura as well as that most characteristic feature of the Nibelungen strophe, the extra stress of the fourth line—a feature which, as Professor Needler well observes, contributes not a little to the avoidance of monotony in a poem of over two thousand strophes. What the effect of this close adherence to the metrical form of the original is, may be gathered from a comparison of the first stanzas in the two versions mentioned. Lettsom's translation reads:

"In stories of our fathers high marvels we are told
Of champions well approved in perils manifold.
Of feasts and merry meetings, of weeping and of wail,
And deeds of gallant daring I'll tell you in my tale."

Needler has:

"To us in olden story, are wonders many told
Of heroes rich in glory, of trials manifold;
Of joy and festive greeting, of weeping and of woe,
Of keenest warriors meeting, shall ye now many a wonder know,"

thus rendering the original with almost complete exactness in verbal expression, in metrical form, and in poetic sentiment; and it can truly be said that this is a good specimen of his work throughout the thirty-nine adventures of the poem. That the translation reads very smoothly could hardly be maintained; and it must be admitted that it has a good many lines which could not give pleasure to an Anglo-Saxon ear. But the same holds good of the original, and it is praiseworthy to have reproduced it without attempting to gloss over its ruggedness and occasional awkwardness. To this truly commendable translation Professor Needler has added a succinct but adequate introduction on the origin of the Nibelungen saga, on its northern form, on the mythical and historical elements of the 'Nibelungenlied,' on the literary character of the 'Nibelungenlied,' and on modern versions of the saga—altogether the best summary of the whole subject to be found in English. How free the author is from uncritical hero-worship, may be seen from this unconventional observation on the literary value of Wagner's Nibelungen tetralogy: "Only the pious loyalty of national sentiment can assign a high place in dramatic literature to Wagner's work, with its intended imitation of the alliterative form of verse; while his philosophizing gods and goddesses are also but decadent modern representatives of their rugged heathen originals."

—A valuable pamphlet has recently been issued from the Manila Central Observatory, under the direction of the Rev. Father José Algué, S.J., Director of the Philippine Weather Bureau, by his assistant, the Rev. Miguel Saderra Mata, S.J. It is printed in both English and Spanish, and contains data for the month of July upon atmospheric pressure, rainfall, relative humidity, winds, magnetic disturbances, earthquakes (including microseismic movements), and crop-service reports from four districts and about twenty-five towns, among them Cebu, Iloilo, Zamboanga, Jolo, and Arayat. The strictly meteorological data — barometer, temperature, humidity, wind, and rainfall—are obtained at the Central Observatory in Manila from hourly observations, and at sixteen other stations from six daily observations. The results are worth considerable attention, especially as compared with July of 1903, showing that the barometric values for 1904 are higher than for the previous year, an advantage given by winds and rainfall. The explanation may be traced from a study of the table and chart of rains, the total amount being most abundant in western and central Luzon, but rather small in the rest of the Archipelago. From the 11th to the 15th the rainfall may be classified as an extraordinary phenomenon, extending from San Fernando to Corregidor. The floods at Manila are graphically illustrated by three plates showing (1) the inundation as seen from the Observatory tower, (2) the Escolta (in the chief shopping district) under water, and (3) near the Quiapo market. The quantity of rain collected in the gauges from 8 A. M. on the 12th to 11 A. M. on the 13th was greater than that registered by the pluviometers of the Observatory in an equal time since its foundation in 1865. It was certainly a "torrential precipitation," 17.19 inches being recorded. Warnings of low pressure, the approach of typhoon centres, are telegraphed to the China coast, and many interesting notes of the fitful, irregular motions of these tropical disturbances are made, valuable in themselves, and of much advantage to navigators in these uncertain waters.

Temperatures in Luzon went up from the first to the last decade of the month; in Cebu and certain other regions the second decade was the hottest, while again in different districts there was a decrease from beginning to end. Fifteen places, including Legaspi, Dagupan, and Gubat, felt earthquakes during July, of more or less force, but none of especially destructive character.

BISHOP CREIGHTON.

Life and Letters of Mandell Creighton, sometime Bishop of London. By his Wife. 2 vols. Longmans, Green & Co.

Among the numerous signs of vitality in the Church of England at the present day, not the least significant is the development of strength and individuality of character among those filling high positions in her hierarchy. Half a century ago the main qualification for ecclesiastical promotion almost seemed to be a blameless mediocrity, dignified in some instances by exceptional erudition or piety, but, with much to command respect, nothing that could excite enthusiasm. But latterly, notwithstanding the necessary existence of restraints unknown in other professions, it may be doubted whether any profession has displayed more remarkable or more varied instances of individuality of character. Tait, Benson, Temple, Thomson, Wilberforce, Magee, Stubbs, Lightfoot, Westcott, Fraser, have each and all revealed qualities which would in any station of life have discriminated them from the mass of men, and, evoking strong antipathy as well as warm sympathy, have shown that inoffensiveness is no longer an indispensable qualification for a bishop. As their appointments, though made by the Crown, have almost always been ratified by public opinion, it is clear that the popular standard of episcopal efficiency has risen, and that the Church has found herself able to respond.

None of the eminent ecclesiastics we have named, however, has possessed a character so original, and so little in harmony with conventional ideas of the mental constitution befitting a bishop, as Mandell Creighton, late Bishop of London. The originality of the others is mainly development in some particular direction, while the rest of the character remains nearer the average level. Attention is at once attracted by the energy and impressiveness of a Temple, the impulsiveness of a Benson, the spirituality of a Westcott, the enthusiasm for humanity of a Fraser. But Creighton was all originality; neither in public nor in private life did he seem like the men around him, while it is extremely difficult to put the secret of his originality into words. His widow and biographer, whose knowledge of him was more intimate than any other person's, has not, although a lady of distinguished literary ability, succeeded in presenting an entirely coherent and harmonious portrait. "There was always," says a biographer, "something mysterious about Archbishop Blackburne," and in like manner Bishop Creighton will remain something of an enigma; not as regards the excellence of his character or the purity of his aims, but from the difficulty of harmonizing his versatile nature with the general conception of an Anglican prelate. This will appear if the question is asked, Would the same difficulty have been felt if he had exercised any other profession, had he been a lawyer, a diplomatist, an author? Decidedly not, we think, to anything like the same degree. He was, it seems to us, a new type of prelate, and yet an old one, a reversion to the ancient type of statesmen ecclesiastics almost extinct since the Restoration. Many rulers of the Church in our day, especially Archbishop Tait and the present primate, have shown statesmanlike qualities, but these have been developed out of the necessities of their position. In Creighton we have the stratum of statesmanship at the bottom, and the strata ecclesiastical superimposed. He was eminent as an historian, he was eminent as a bishop, but the distinctive note, both of his history and his episcopate, is their association with the primary instincts of a statesman, while at the same time he was so much else that his character refuses to be reduced to a formula or brought to a focus.

The extent to which statesmanship yielded the keynote alike to Bishop Creighton's literary and his ecclesiastical character, is visible in the two episodes of his career by which his name will be chiefly preserved —the composition of his history of the Latin Church in the Reformation period, and his discharge of the laborious and thankless office of governing the diocese of London. It was not, perhaps, altogether detrimental to his reputation that his history should have remained a noble torso. The last chapters, describing the outburst of the Reformation in Germany, are the least successful—partly, no doubt, from the interference of conflicting cares and duties, but mainly from imperfect sympathy with grand rough characters like Luther, and the tumultuous energies of popular movements. Where Carlyle would have been strong, Creighton is weak; but where Ranke would have been strong, he is even stronger. He is essentially an historian of the cabinet, and delineated the transactions of history as they appeared at the time to those who had the management of them. The period from the great schism of 1378 to the unchaining of popular forces by Luther in 1517 is an age of statesmen, of politic and unscrupulous rulers, civil and ecclesiastical, not compelled as now to defer to public opinion, and unconscious of the revolution which they were aiding to prepare. With this class of personage Creighton was in full sympathy; his statesmanlike instincts enabled him to comprehend the position of the ruler or diplomat enveloped in meshes of intrigue, partly of his own spinning; and the characters which would have baffled the ordinary historian appear in Creighton's pages full of reality and life. The censure which he himself, jaded by toil, passed upon his own book by terming it dull, is entirely undeserved; notwithstanding the sobriety of the style and the absence of stirring narrative and picturesque description, large portions may be justly described as fascinating, and the secret of the charm is that we feel ourselves throughout in the hands of an expert, as thoroughly at home with policy as a great military historian is at home with war. Although, however, the complexion of the narrative is of necessity mainly political, we are never suffered to forget that the Reformation is the theme, and the busy scene unfolded to us is really significant as the precursor of a mighty revolution. Creighton's impartiality is proverbial, and is sufficiently attested by his general agreement with Pastor, the Roman Catholic historian of the same period, whose work, nevertheless, indicates the great disadvantage at which such an historian finds himself in comparison with his Protestant fellow-laborer. Creighton's impartiality is easy, natural, ungrudging, a thing of course. Pastor's is gained only at the expense of a conflict with prepossession and ecclesiastical tradition, and is displayed with a curious mixture of ostentation and misgiving, as though it were something to be made the most of while one has got it, seeing that it is only held by sufferance of the Pope.

Creighton's gifts as a statesman must not lead to the inference that he was a man of a cold and reserved temperament. On the contrary, his was an exuberant nature, full of humor, playfulness, and kindly sympathy with mankind in every phase of existence. It is partly this alliance of seemingly contradictory qualities that makes him difficult to apprehend. Dull men could make nothing of him, and even insight and sympathy may be able to agree only in recognizing that, whatever he was, he was unlike the rest of his order. A longer continuance in a situation of such painful publicity as the bishopric of London would have enlightened the world. Like his History, his episcopate was a great torso; but whereas the portion of his historical narrative most congenial to his peculiar talent, coming first in order of time, was fully executed, his trying but successful episcopate would have proved the prelude of greater things. His administration of his former diocese of Peterborough had been most satisfactory, but Peterborough was not a severe test, and the problem of ruling a vast diocese like London, already in a state of confusion from his predecessor's laxity in matters of ritual, largely leavened with half-hostile and more than half-distrustful clergy, and agitated by demands on the part of the laity for a more strenuous repression of illegal practices than he thought prudent under the circumstances, was one to test the most sagacious administrator, and especially one who could never avail himself of the ordinary episcopal resource of decorous conventionality. No one, he said of himself, did fewer imprudent things, or uttered more. Near the beginning of his episcopate, the persistent worrying of a bore stung him into a hasty dictum which he was unable to sustain, and he never quite got over the distrust thus occasioned. On the whole, however, his record is one of steady progress in winning not only the confidence but the affection of all parties, who were coming to see more and more that the mainspring of his conduct was the statesman's, a patriotic attachment to the Church of England as the national Church, and that he made light of niceties of creed and ritual in comparison with her well-being. This feeling found no echo among a large proportion of his clergy, but it endeared him to the laity; and had he lived, the next vacancy at Canterbury would almost certainly have installed him there, where he would have left a reputation probably enviable, certainly unique.

Previously to his appointment to Peterborough (in 1891), Creighton's life had been

that of a Northumberland vicar, a canon at Worcester, and a Cambridge professor of ecclesiastical history. He had shrunk from any effort to impress himself upon patrons or the public, yet was continually finding his level among the leading Churchmen of the age, and promotion seemed to come to him in the course of nature. The accident of his Northumberland locality made him the intimate friend of the noble house of Grey, and his first book was a privately printed memoir of Sir George Grey, the retired Home Secretary, and by no means to be confounded with the Governor of New Zealand. His closest friends of great literary distinction were J. R. Green and his wife, Mrs. Humphry Ward, and Mr. Robert Bridges; but he became almost of necessity intimate with historians and students of history like Lord Acton, Bryce, Hodgkin, Stubbs, Horatio Brown. Though interested in art, he does not appear to have had a large acquaintance among artists, and science did not appeal to him. He was devoted to travel, and one of the chief sources of the influence he came to wield was the thorough acquaintance he gained with both foreign countries and English parochial life by his long pedestrian rambles. His personal visits to Continental archives also were of great service to him as an historian. He does not seem to have at any time come under any dominating influence from any contemporary thinker or teacher; his attitude towards all schools of thought was one of detachment. Many famous writers failed to impress him; and, if he had a spiritual guide, it was no contemporary, but Dante, whom he had the courage to prefer to Shakspere. "Shakspere was the greater man, as being more universal, but Dante has more charm for me as being more intense"—a judgment which would have seemed natural in Cardinal Newman, but is surprising in one of Creighton's interest in every phase of human life. Poetry, however, though he admired Browning and translated the Italian poets with dignity and grace, seems to have constituted but a minor portion of his mental equipment. History, in its widest sense, especially including the history of literature and education, was his main educator, and everything, from architecture to seal-engraving, interested him that was capable of being employed in the historian's service. With this hold on the concrete, it is not surprising that he should have slighted abstractions, and have protested against the rules of grammar taught by rote. His estimates of men and matters were in general very sound. He returned from America with a feeling of hopefulness; he thought the Italians, with their practical common sense, intellectually nearer to the English than either the French or the Germans; the picturesqueness of the Southern Slavs did not blind him to the inconveniences of their political situation.

Mrs. Creighton's biography is a model of sound literary judgment, particularly in its accurate proportion. Every moral or intellectual characteristic of the Bishop, as every episode of his life, receives notice in the strict ratio of its importance. She has also displayed tact, and, no doubt, self-denial, in her general reticence and avoidance of the direct panegyric which might frequently have well become a biographer less deeply interested in the subject. The slight impression of coldness thus resulting is removed at the end of the work by a chapter of "Characteristics and Sayings," chiefly made up from the communications of intimate friends who have felt under less restraint, and whose retrospection materially aids to complete the portrait of one whose dissimilarity from ordinary types almost ranks him with the "problematic natures" so dear to Goethe, but whose wisdom, scholarship, devotion to Church and State, and genuine goodness of heart are no problem.

A NEW CO-OPERATIVE HISTORY.

The American Nation: A History. From original sources by associated scholars. Edited by Albert Bushnell Hart, advised by various Historical Societies. Group I. Foundations of the Nation. Vol. 1. *European Background of American History*, 1300-1600. By Edward P. Cheyney. Pp. xxviii., 343. Vol. 2. *Basis of American History*, 1500-1900. By Livingston Farrand. Pp. xviii., 303. Vol. 3. *Spain in America*, 1450-1580. By Edward G. Bourne. Pp. xx., 350. Vol. 4. *England in America*, 1580-1652. By Lyon G. Tyler. Pp. xvii., 355. Vol. 5. *Colonial Self-Government*, 1652-1689. By Charles M. Andrews. Pp. xviii., 269. Harpers. 1904.

Of making "series" on American history there is, apparently, no end; indeed, it is doubtful whether we have as yet anything more than the beginning of such undertakings. Whatever the motive—whether the desire of scholars to combine for the achievement of a task admittedly beyond the powers of any but the ablest of them, or of the public to have their history elaborately set forth, or of publishers to launch subscription books on a large scale—the co-operative history is upon us. We are not of those who regard such enterprises as unimportant. Where the mass of material has grown so portentously as it has in the American field in recent years, and where the subject lends itself naturally to subdivision, the method has advantages not to be ignored. A coöperative history can never hope, of course, to attain the scientific unity or literary distinction of a work which flows from a single mind and pen, but it can attain a balance and an accuracy even more sure than the work of most individual writers is likely to possess; and, in the writing of history, accuracy and balance are qualities of high importance.

The series which Professor Hart has undertaken to edit, and of which five volumes have lately appeared, may justly be regarded as the most notable attempt, in the character of its associated authorship and the carefulness of its arrangement, yet made to deal with American history on the co-operative plan. The idea of the work, as set forth in the brief editorial preface, contemplates a history which will meet the need for "an intelligent summarizing of the present knowledge of American history by trained specialists," and at the same time supply "a complete work, written in untechnical style, which shall serve for the instruction and the entertainment of the general reader." Such a work must, of course, be based on "original materials," though presenting the results rather than the processes of scholarship. The successive volumes, taken together, must form a continuous narrative, without either disjointedness or overlapping, and must deal not only with political and constitutional history, but also with economic and social matters, industrial development and organization, and international relations. In other words, Professor Hart, while not eschewing such original contribution to the subject as is possible under the circumstances, has primarily asked his collaborators to tell to intelligent laymen the story of American history as the scholar would wish it told.

The five volumes now published may presumably be taken as sufficient indication of the way in which the plan of the editor is to be carried out. The volumes are of moderate size—about seventy-five thousand words each—divided into about twenty chapters. The topical subdivision is, therefore, somewhat minute. For all important statements there are substantiating references to authorities in footnotes, while a final chapter indicates the bibliographical material, both printed and manuscript. There are no illustrations save a portrait frontispiece to each volume, but there is good provision of maps, some in colors, others in black and white, and most of them prepared especially for this series. Each volume is separately indexed. Brief prefaces by the editor summarize the leading topics treated in the several volumes, and point out the significance of the period in the general scheme of the work. The mechanical execution is excellent throughout.

To speak briefly of the several volumes: Professor Cheyney's 'European Background of American History' is a novel attempt to point out the characteristics of European civilization which most affected American exploration and colonization. Beginning with an account of mediæval commerce, especially between Europe and the East, and the effect of the Turkish conquests in forcing a search for a water route to Asia after the land routes had been practically closed, Professor Cheyney passes to the early connection of the Italian cities and Portugal with map-making and geographical study and exploration, and to the political and commercial systems of Spain, France, and Holland in the sixteenth century. Then follow two chapters on the system of chartered commercial companies, of which the Virginia Company, the Dutch West India Company, and the Company of New France were notable types. A list of seventy such companies (pp. 137-139) organized before 1700 shows how widely the system prevailed; Spain alone, which kept the control of its colonies in its own hands, being unrepresented. The list is incomplete, a number of French companies given in Chailley-Bert's 'Compagnies de Colonisation' not appearing in Professor Cheyney's enumeration. Four chapters are given to the Protestant Reformation and the religious wars on the Continent, and the rise of Episcopacy and the dissenting sects in England, and four to English political institutions, central and local. The difficulties of selection from a large mass of relevant facts have been, on the whole, well met; and while the volume has necessarily a "scrappy" character, it should prove very useful to all who wish to see, not only what were the European conditions in which American exploration and colonization developed, but as well the reasons for the course it took and for the failures and successes of the nations which engaged in it.

Professor Farrand's 'Basis of American

History' deals with the physical conditions of colonization, as represented by the physical characteristics of the Continent and the native races encountered by Europeans. The general physiography of North America is briefly described, together with the timber and agricultural products and animal life. Of special interest is the chapter on waterways, portages, trails, and mountain passes—ancient avenues of communication with which the whites early became familiar, but whose influence in determining the course of settlement has been commonly overlooked. The larger part of the volume, however, is devoted to the native races, a subject on which Professor Farrand is entitled to speak as an authority. With less wealth of detail than is found in Dr. Cyrus Thomas's corresponding volume in Lee's 'History of North America,' and without attempting to write a history of the Indian tribes in their relations with the whites, Professor Farrand summarizes with studied brevity the results of scientific inquiry, and on controverted points (such as that of the antiquity of man in America) announces conservative conclusions. Much that is said about the various geographic groups of Indians has, of course, no particular historical bearing save in very recent times. We could wish, too, that the chapter on the manners, customs, and beliefs of the Indians had been expanded. The bibliographical chapter is a comprehensive survey of the literature, particularly the recent monographic studies.

With Professor Bourne's volume on 'Spain in America' we reach the period of exploration and colonization. Both as a compendium of facts and as an original contribution to historical writing, this volume must be given high praise. The discussions of Columbus and his work, of the demarcation line of Alexander VI., of the voyages of the Cabots, and of the naming of America are luminous. To quote Professor Bourne's own summary:

"The four discoverers—Columbus, John Cabot, Sebastian Cabot, and Amerigo Vespucci—have fared variously at the hands of modern historical criticism. John Cabot has been raised from almost complete obscurity to become a prominent but still shadowy figure. Sebastian Cabot has been pulled down from the lofty pedestal which he apparently erected for himself, his veracity is impugned, his scientific attainments disputed, and his lack of filial piety exposed to a glaring light Around Vespucci the storms of controversy have raged for three centuries and a half, and he has suffered from them like Sebastian Cabot. His claims for himself have not stood the test. While he has been cleared of complicity in having his name attached to the New World, it is generally accepted that he antedated his first voyage to secure a distinction which did not belong to him, and that his narratives unduly exalt himself at the expense of others equally entitled to honor. The position of Columbus alone has not been materially affected by the modern scrutiny into his career. Opinion has differed about his character, but the record of his achievement has been unshaken, and the estimate of its significance has risen rather than fallen" (p. 103).

Even more important than the discussion of geographical questions is the account of the Spanish colonial system, and of social and political life in Spanish America. Students of American history have largely forgotten, if, indeed, many of them ever knew, the structure of civilization and intellectual culture which was built up in the Spanish-American colonies in the sixteenth and seventeenth centuries, as evidenced by the building of cities and towns, the construction of roads and bridges, and the founding of missions and schools. Even the treatment of the Indians, severe and disastrous as it was at times, loses some of its darkest colors the more it is studied. Professor Bourne clearly exposes, however, the fatal defects of the Spanish colonial system—its policy of commercial restriction and denial of self-government—though in neither of these respects was the policy of Spain materially different in principle from that which for a time struggled to assert itself in the colonies of England and France.

More qualified praise must be accorded to President Tyler's account of 'England in America.' The book is an orderly, instructive, and agreeably written narrative of the beginnings of the English settlements, but the general impression which it makes is slight. Neither in fact nor in presentation does it offer anything new, while at times it hardly rises to the importance of the topic in hand. We cannot think, in particular, that the author shows any adequate appreciation of the significance of the religious motive in New England, or of the political or social principles involved in the struggles of the settlements about Narragansett Bay. Perhaps it is true, as Professor Hart says in his introduction, that the fathers of the Puritan republics are here "further relieved of the halo which generations of venerating descendants have bestowed upon them, and appear as human characters," but we are clearly of opinion that President Tyler has not caused them to appear as just the sort of human characters they really were. Of Virginia and Maryland the treatment is somewhat more satisfactory, though here again the discussion does not go much below the surface of events. The book is, in short, a useful summary, but it can hardly be called a contribution of marked importance.

Professor Andrews's volume on 'Colonial Self-Government,' on the other hand, rivals that of Professor Bourne in its substantial additions to available knowledge. The period is a peculiarly interesting one, and Professor Andrews is one of the few writers who give evidence of any thorough knowledge of it. His account of the English colonial administration, for example, is superior to any brief account with which we are acquainted. There is new light on the charter struggle in New England, especially as regards the attacks on the Massachusetts charter; on the commercial reasons for the English conquest of New Netherland; and on the founding of Pennsylvania. Nothing can make the early history of New Jersey interesting, but Professor Andrews has at least cleared the story of much of its entanglement. Best of all is the rehabilitation of Andros, than whom no official of the old régime, with the exception of Hutchinson, has suffered more at the hands of New England historians. Professor Andrews, apparently alone of all the writers in this group of volumes, has made extended use of manuscript as well as printed material, and the results are shown in a general freshness of presentation as well as in the correction of numerous details.

Taking the five volumes as a whole, the general verdict must be one of cordial approval. All the writers have succeeded in attaining brevity and compactness without falling into an elementary style, while the volumes of Professor Bourne and Professor Andrews must be given high rank as substantive contributions in their respective fields. The literary form, though in no case striking, is meritorious and of fairly even quality. If the remaining volumes maintain the general level of those now published, the "American Nation" will justly earn a place among the most successful examples of historical writing on the coöperative plan, as well as among the works which laymen and specialists alike will think it necessary to read.

RECENT FICTION.

Doctor Luke of The Labrador. By Norman Duncan. Fleming H. Revell Co.

Whosoever Shall Offend. By F. Marion Crawford. The Macmillan Co.

Christmas Eve on Lonesome, and Other Stories. By John Fox, jr. Charles Scribner's Sons.

The Heart of Happy Hollow. By Paul Laurence Dunbar. Dodd, Mead & Co.

Mr. Duncan's pen has voyaged northward since his very striking sketches of the Newfoundland coast. But, if the latitude is higher, the story has warmly expanded, and, as befits the scope of a novel, gives not only the cruel, but the endearing side of the sea. His characters were always kindly, and now he has amplified and multiplied them into his larger canvas till there is a group of figures of excellent variety and of the best sort of originality, self-stamped as made up of discovery and sympathetic interpretation. Should the rest of the book be forgotten, which it will not be, Skipper Tommy Lovejoy is destined to immortality. The Doctor is very human and very well defined; a ministering hero, but quite removed from the usual sugar-pellet doctor of fiction. Davy, who tells the story, would perhaps be a little incredible if it were not that Mr. Duncan engenders faith in his own descriptions. Almost any amount of sentiment and maturity even in a small boy may be believed in after it has been shown that he has been reared under the lonely outward conditions of a cold seacoast and in tenderest intimacy with an adoring, mystical mother. The faith-compelling power is one of the distinguished traits of the book. All a-shiver with the harshness of the life depicted, the reader is yet kept aglow with the love of the Labrador folk for their land. The story is perfectly fitted into the strange, wild surroundings; the adventures are of the most stirring and dramatic; the home side of the picture most tender; while the humorous, it seems, flourishes apace in the Labrador alongside of the rough, the gaunt, the superstitious, the grimly pious. Mr. Duncan dips his pen in word witchery—sometimes, it may be, a little too deep. It is a good sign that, since his 'Way of the Sea,' his language has grown less spumy, and less suggestive of rebellious vichy siphons. His epithets are here kept well under control, and are naturally the stronger for it. Nor is his poetic tendency ever misplaced. The blemish lies rather in his artificialities, reminiscent of Stevenson, Bullen, Robinson Crusoe, John Gilpin, Weyman, and the Book of Acts. These are mainly good models, truly, but it is to be hoped that Mr. Duncan will forget them all and speak for himself in words as beautifully Anglo-Saxon as he now uses

and forego preciousness of phrasing. Yet, should he decide otherwise, we can continue to be grateful for his rich responsiveness to nature and humanity, and his great-hearted, boundless horizon. It only remains to say that a few charming photographs and a little map complete the comfort of the reader.

In Mr. Crawford's novel is much of Mr. Crawford's special material—his Rome, his Campagna, his Italian seashore; furthermore, his Italian peasantry, assassins, ladies of limited vision, shady characters, and *ingénus* of both sexes. Of murders and almost-murders, there are many of varying intensity; the earlier ones, well-bred, thrillless, painless to victim and reader; the later specimens quite in the melodramatic manner, horrid enough to satisfy any sensation-seeker. It is characteristic of the author's measured style that his murderers talk fluently of their crimes before striking. We can almost understand Settimia's cry to her assassin, "Do it quickly!" In the case of Regina, it is to be supposed that Mr. Crawford knows the hill-peasant thoroughly; therefore, it must be true that a woman bent on extracting information, and resolved to kill as a last resort, would talk in unmoved, didactic calm to her proposed and helpless victim. In truth, all the persons speak an impeccable Crawfordese, except the peasant men, who reveal unmistakably the writer's intimacy of understanding, and spring at once into the reader's belief. The story of Regina's devotion to her lover is one of a loyalty well-nigh incredible. Corbario's offence against his young stepson includes not only encouragement to evil ways, but attempted murder, which failing, it is hard to understand why he should have hesitated at another form of taking off speedier than the slow one of ruining his constitution by dissipation. The use of physical weapons for Marcello's destruction takes away from the deadly force of the moral ones to which the name of the story calls explicit attention. It is perhaps more detestable to pervert a boy than to sandbag him, but to do both not only is waste of deviltry, but divides reprobation and spoils a good title. The story is ingenious, the sketches of scenery and peasantry admirable, the comments by the way philosophic and thoughtful; the English, of course, of the best-regulated. The reader for the most part, however, remains outside.

For any one who has not had enough of the "Jay-Hawkers of Kaintuck" and the Virginians of Cumberland Gap, with their warfare, feuds, pistols, and whiskey, there is excellent provision in Mr. Fox's little book of stories. The one that furnishes the title is a grim bit of pathos: "The Army of the Callahan," an amusing sketch of bouffe militarism; and "Christmas Night with Satan," a very good and doggy little dog-story. The three that remain are deafening with shots, and sickening or tiresome with vengeance.

"Wherever negroes colonize in the cities or villages, North or South, wherever the hod-carrier, the porter, and the waiter are the society men of the town, . . . wherever . . . the spirit of labor and laziness shake hands, there—there—is Happy Hollow." Thus runs in part Mr. Dunbar's Foreword to his volume of sketches. As we read them, we are struck with the fact that to be civilized is to lose picturesqueness. The negro grown away from slavery becomes a man in the street like other men, a part of the industrial machine, no longer a decorative feature, a lyrical refrain or a national episode. To the old "plantation darkey" succeeds the political boss; to the shouting parson, the diplomatic preacher of a city congregation; to the doting mammy, the thrifty, saving laundress, or the richly pensioned widow. Mr. Dunbar has a picturesque way of showing the lapse from picturesqueness. He does it without failing to infuse humor into his less humorous theme, and without wholly eliminating the pathetic element to which striving and jobbery are well-nigh fatal. Very few of the flowers of rhetoric survive; he is too true an artist to describe sociology in terms of botany. His sense of culmination, moreover, is unerring. Therefore, not all unpicturesque are his tales of the promoter, the "tout," the jockey, however reluctantly we may see our friends of the plantation promoted into vulgarities which literature hitherto has associated with the white race. The book, ably illustrated by E. W. Kemble, and beautifully made, shows several discreditable lapses in proof-reading.

The Russo-Japanese Conflict: Its Causes and Issues. By K. Asakawa. With an introduction by Frederick Wells Williams. Illustrated. Houghton, Mifflin & Co. 1904.

With Dr. Asakawa our readers have already made acquaintance. His newest book, to use his own words, is "an attempt to present in a verifiable form some of the issues and the historical causes of the war now waged between Russia and Japan." It is a statement, as Professor Williams, in his introduction, very justly says, remarkable for both its brevity and its restraint. In a small volume of less than four hundred pages (all his statements are fully fortified by authorities), he has given an account not only of the economic conditions which underlie the quarrel, but of the diplomatic negotiations which preceded and the national and international tendencies which caused the conflict; such historical facts are added as are necessary to enable the reader to understand the whole. The book is so dispassionately written that the nationality of the author, if not disclosed, would hardly have been guessed.

We shall not here undertake to review Dr. Asakawa's analysis of the causes which led to the war; in the main, it corresponds with the opinion formed generally by the reading public in this country when the war broke out. To any one who has not made up his mind, the book may be recommended as containing most of the evidence bearing on the question at issue, fairly and very concisely presented. If the Russian Government has a case which meets it, all we can say is that we do not know what it is, and that it is a thousand pities for Russia that it has not been stated. Was there a good reason for breaking her promises, made in the forum of the world, as to the evacuation of Mantchuria? If so, we do not know it. Is there any doubt that, economically, the conflict between Japan and Russia grows out of the determination of Russia to close Mantchuria and Korea to the world, and of Japan that they shall not be closed? We know of none. Finally, if war is to be justified (and it generally has to be so justified, if at all) as a violent and lamentable form of international justice, what answer has ever been made to the claim of Japan that she is entitled as a belligerent and sovereign State to have the enormous injustice dealt out to her by Russia at the close of her war with China redressed?

It is, of course, impossible to prove that the war might not have been avoided by Japan. Even after reading this able statement of the Japanese case, it may still be contended—and such, we take it, is the Russian contention—that Japan has no better standing on the continent of Asia than Russia; that both Japan and Russia are aggressors; and that there is no ethical difference in the ultimate designs of the two with reference to Korea or China. Both desire to "expand," and expansion necessarily means either conquest or absorption. Ethically speaking, Japan should aim only at preserving her own integrity, and the moment she enters upon a continental struggle with Russia, she is *in pari delicto*. Consequently, she should have either yielded to the encroachments of Russia in Mantchuria and Korea and adhered to a policy of internal development, or, at any rate, not have attempted to justify her stand on moral grounds.

But it is one of the strong points of Dr. Asakawa's argument that he does not take very high moral ground. His statement of causes leading to the war is rather political than moral. At the bottom of it all is the conviction—quite justified, it seems to us, by what we know of Russia's past and by the history of the negotiations preceding the war, here given—that Japan's autonomy is ultimately at stake. This belief does not come only from the fact mentioned in the author's introductory chapter (p. 51), that the island of Tsushima, lying halfway between Korea and the Japanese coast, and from which on a clear day the coast of Japan can be seen, was not very long ago, in the days of her weakness, actually wrested from Japan by Russia, and with difficulty recovered. There are a multitude of facts, no one conclusive in itself, but which, all taken together, go to show that Japan must either have what the Greeks would have called the hegemony of Eastern Asia, or submit to the danger of ultimate conquest by Russia. Such, at any rate, is the feeling of men as sensible and restrained as the author of this book, and it is this feeling which makes it seem, not only to the Japanese themselves, but to the world at large, in a measure, a war of self-defence.

But, even if it were not so, there is a vast difference between a war waged for the expansion of Russia and a war waged for the expansion of Japan, in the East. To the world generally, the growth of Japan means the growth of freedom and commerce, while that of Russia means the growth of absolutism. For the East the former means a genuine renaissance of a kind long prayed for and long despaired of by every well-wisher of that oppressed division of the world.

Besides all this, the victory of Japan will be an inestimable blessing to the Western world in curing it of a long-cherished and deeply rooted illusion—that which has always prevailed on the subject of "inferior" and "yellow" races. The idea that the Caucasian, or white man, has been called by destiny to govern the rest

of the world and therefore to "absorb" any part of the earth possessed by any other race that takes his fancy, is an idea which can be dispelled only by force. Japan has shown that "yellow" men can hold their own with white men, and sink their navies and take their fortresses, and defeat their armies in the open field. The Japanese have shown, too, that while doing this they can use the fruits of their victories with just that humanity and enlightenment and devotion to civilization of which, with our egregious vanity, we are forever arrogating to ourselves the monopoly. They have almost made a farce of the "white man's burden," and they could not have done us a better turn.

The Japanese war is the first great conflict since our civil war in which the sympathies of liberals the world over are almost altogether on one side. A feature of Dr. Asakawa's book which confirms the feeling that the "good old cause" is being defended, is precisely that restraint in tone and expression which usually marks the behavior of peoples, as of individual men, when engaged in a just quarrel, and which is so lamentably absent on the Russian side. In reading it, one goes back to other wars, and other statements of causes put forward in their defence. With the same sort of temperance Franklin laid the case of the American colonies before the world, and Lincoln stated that of the North against the South.

Storia degli Scavi di Roma, e Notizie intorno le Collezioni Romane di Antichità. Da Rodolfo Lanciani. Vol. II. (A. D. 1531-1549). Rome: Loescher.

The second volume of Lanciani's great work appears promptly in the wake of the first, and deserves as warm a welcome. As the period of the history progresses, the extant material becomes more abundant; and this second volume, instead of covering the activities of well-nigh five centuries, nominally carries the narrative forward only eighteen years. Yet in reality the lines of the story reach out much further than this, for the author has in some respects changed with this volume the plan of his work. He has combined into a single article, or chapter, all the items concerning a given building, or group of buildings, or a given collection, from the initial date of his volume (1531) up to the end of the sixteenth century, and has placed each chapter under the date of the first item that appears in it. For many important *lemmata*, then, like the Mausoleum of Augustus, the Forum, the Capitoline Museum, the period of this volume extends, not to 1549, but a full half-century further.

The effect is to heal somewhat the disjointed aspect of the work, and to make more pleasant the tracing of the fate of a given monument or area. The latter purpose would have been attained, however, to some degree by the more detailed indexes which the author has made for this volume. As it is, the one thing lost that the first volume furnished is the power of getting easily a bird's-eye view of what was going on in the city in any given year or short period of years. It may be a question which opportunity is of more value. The dilemma that of necessity confronts a book in which verbatim extracts play such an important part, is clearly to be seen. Perhaps, after the 'Storia' is finished, Comm. Lanciani will give us, upon the basis of its and his other material, a genuine history of this side of the city's life during the centuries covered by his present work. Such a book, he may be certain, would attract many readers who have perused with interest the slight sketch afforded by the last hundred pages of 'The Destruction of Ancient Rome.'

Lanciani's present volume opens with Clement VII. still on the throne, "that cowardly bastard of the degenerate house of Medici," as Gregorovius calls him, whose "pontificate was fraught with grief and ruin both to the world and to Rome." He had only three years more to live, and at his death the city might draw a sigh of relief that the chapter in her history which included the shameful sack of Rome was closed. In these last years of Clement's reign began certain operations about the Mausoleum of Augustus, which proceeded further under his successor, uncovering (and as usual also destroying) many remnants of that remarkable edifice. Some excavations seem to have taken place also on the site, or in the immediate neighborhood, of the much-enduring Basilica Æmilia. Whether the peculiar discovery mentioned by the younger Antonio da Sangallo in 1531 was indeed the corner-stone of the Basilica (or of the Temple of Janus), as Lanciani thinks, may appear doubtful to the lay mind, but the finds of the succeeding decade or so must at any rate have been of great interest and extent. It seems possible that the excavators reached even the pavement of the Basilica, though one could hardly feel justified in concluding this, as Lanciani appears to do, by connecting the recorded find of "a great number of bronze coins" with the many traces of melted and corroded coins recently found imbedded in the marble floor of the inner hall. The earlier discovery may have been a compact hoard that had nothing to do with this scattered windfall.

Paul III. (Farnese) ascended the throne at a happy moment for his reputation. His reign could hardly be other than reasonably bright, were it only by contrast with that of his immediate predecessor. The student of church history will remember him as the man who owed his early cardinalate to the passion of Alexander VI. for his beautiful sister; who reluctantly initiated the Counter-Reformation and summoned the early-throttled sessions of the Council of Trent; who established the Roman Inquisition, and whose external politics centred around the attempt to found a principality for his worthless natural son. The reader to whom a non-religious or an irreligious Pope is as good as any other, will dwell rather upon his record as a magnificent and genial prince, whose broad schemes for the embellishment of his capital resulted in the laying out of many of its finest streets as we still see them—Corso, Babuino, SS. Apostoli, and others—and in the building of magnificent edifices, among them part of St. Peter's and the finest palace of all the city of grand palaces. The student of art will recall him as the Pope under whose imperious pressure Michelangelo painted the "Last Judgment" and the frescoes of the Capella Paolina.

The topographer has reason both to mourn and to rejoice over that zeal for the Fabbrica di S. Pietro that distinguished the Farnese Pope. It brought to knowledge numerous ruins in various parts of the city, but it brought them also to destruction for the sake of building material. One of the first acts of the new pontificate was to appoint Mannetti commissary of antiquities, and to direct him in stately and studious Latin phrase to guard from all approach of possible harm a long list of classes of monuments and marbles, "and whatever else might be understood under the name of antiquities or memorials." The new broom apparently meant to sweep clean, but it was speedily thrown into the dust-heap. In 1540 the pontiff issued a brief cancelling all former licenses for excavation, and embracing the entire city and suburbs in one great area of organized destruction. Authority was given to the deputies of the Fabbrica of St. Peter's to mine and excavate at will in any or all property belonging to people or to Church, in or out of the city, for marble, travertine, columns, or any other material useful in their building projects. At the same time they alone were empowered to grant licenses for excavation on shares to private individuals or corporations. A ten years' sack of the remains of ancient Rome followed. Our space is too limited to describe in detail, or even to summarize intelligently, the thoroughness with which the reverend deputies of the basilica of the Prince of the Apostles carried out their vandal commission. With regard to the Forum, Lanciani's own statement deserves quotation:

"To this brief we owe the destruction of the monuments of the Forum valley, which, though the part projecting above the modern soil had been damaged, were yet well-nigh intact where protected by the layer of rubbish. If the ten-year campaign set on foot by Paul III. had not taken place, it is not hard to picture in what shape the Count of Tournon, who began the excavations in Napoleon's time, and we ourselves, should have found the Forum. We should have found the steps and the stylobate of the Temple of Antoninus perfect in every particular, with a boundless wealth of honorary bases, of reliefs and *acroteria* fallen from the tympanum, of cornices, and of broken statues; the remnants of the arch of Fabius at the foot of the ascent of the Sacra Via, with its historic dedications; the Temple of Cæsar perfect up to the level of the cella, upon which stood the foundations of the tower of the Inserra, torn down in 1536; the Regia, with the *fasti* yet in position; the Arch of Augustus, with its inscriptions; the Temple of Vesta, with its peristyle, levelled indeed to the ground, yet but little of it vanished; the Atrium, with the pedestals of the *Vestales maximæ* yet standing under the quadriportico; the Temple of Castor, perfect below, and buried under a mountain of columns, bases, capitals, and cornices, that sufficed to feed the Farnese lime-kilns till 1550; the portico *ad Minervam*, where the imperial decrees were posted, with some of the bronze tablets yet in place; the Augusteum in the condition in which artists of the time depicted it; the statue of Vortumnus yet standing at the head of the Vicus Tuscus; and, interspersed among this noble rank of monuments, Christian memorials of the early Middle Ages, stone-cutters' shops of Carolingian times, or of the early Renaissance, lime-kilns with archæological material hardly touched by the fire, statues, reliefs, inscriptions, medals, coins in infinite number. Ten years were enough to reduce that 'nobilissimus Romæ locus' to its present state of desolation."

Nothing need be added to that pregnant picture.

Chapters of Lanciani's book of great interest to others than topographers are those on the formation of the Capitoline museums, and on the building of the Farnese

Palace and gathering of its collections. Extensive works at Tivoli and Ostia find detailed treatment in this volume. The accounts of the setablishment of the Church of S. Maria degli Angeli within the Baths of Diocletian, and many other fruitful excavations within its limits; the removal of the equestrian statue of M. Aurelius to the square of the Capitol, where it still stands upon a pedestal carved by Michelangelo out of an immense block of marble from Trajan's Forum; the building of the great bastions of Sangallo—these and a dozen other chapters furnish most agreeable and stimulating reading.

The author occasionally displays his personal bias, as when, for example, he protests (p. 96) against the position of those who would deny the present commune of Rome the moral right to keep its own collections of antiquities apart from those of the state, and under its own exclusive control; or when (p. 219) he refers to Boni's yet uncompleted work about the Sacra Via as "the recent devastations." In this day of the investigation of Roman origins one may wonder whether the hydriæ mentioned by Marliani in connection with "ossa cadaverum" as discovered within the Porta Salaria, not far from Sallust's gardens, could have marked the primitive necropolis of the Quirinal settlement.

The Becquerel Rays and the Properties of Radium. By Hon. R. J. Strutt. London: Edward Arnold. 1904. New York: Longmans.

From the son of Lord Rayleigh one anticipates intellectual superiority—not necessarily individual force, but that superiority which comes from sitting often at table during many years with the leading physicists of Europe; and one is not disappointed in the event. The promise of his preface is only "to give as clear and simple an account of the phenomena of radioactivity as the subject admits of, without sacrificing accuracy," binding him to no more than compilation; but in generous fulfilment he gives us a most interesting discussion of all the questions that have been opened by the discernment and skill of Mme. Curie. Indeed, his only fault worth mention is that he has not realized that the majority of those who will attach a value to the volume would have been glad if, somewhere between its covers, somewhat fuller details could have been found. They are mostly quite able to read mathematics, be the motive for doing so sufficient; they would have liked references to the original papers; and they would have been glad to know that they had only to take down this book from their shelves to find, for example, the value of Mme. Curie's determination of the atomic weight of radium, and other minutiæ of that nature. It is a most interesting book, brimful of information and of thought; but it falls just a little short of the kind of perfection that an experienced bookwright would have imparted to it. The lacking matter we have spoken of might have been relegated to the appendices, of which there are three as it is, besides a direction to "see" an unembodied fourth. It will not be long before a new edition of this work is called for—or if there is not such a call it will be only because of this irrepletion. Let us hope there soon will be a second edition, and that the little conveniences we speak of will have been put in before the work is offered again to the public. Probably Mr. Strutt did not wish his volume to dispute the ground with Rutherford's 'Radioactivity.'

Beginning with an account of Crookes's exquisite experiments (for let us not forget that it was Crookes's surpassing genius that started the whole development), Mr. Strutt first treats of the cathode rays, and shows how it was a happy idea of Henri Becquerel's—albeit, most curiously, a totally mistaken one—that brought about the discovery of radioactivity. Mr. Strutt says this was a circumstance unparalleled in the history of science, and the remark (which, we doubt not, expresses not only his own impression, but that of a whole circle of the first physicists of the world) merits our attention as illustrating, in despite of Dr. Karl Pearson, what very great significance those men attach to successful prediction. The case was this: The cathode rays of Crookes's tubes produced a peculiar green phosphorescence in the glass where they struck upon it; and this led Becquerel, after Röntgen had discovered that from the outside of the glass at that point his wonderful X-rays were given off, to surmise that salts of uranium, which likewise phosphoresce with green light, might perhaps emit similar rays. To test his guess, he wrapped a photographic plate in black paper, and, having placed some uranium nitrate upon the paper, awaited results. Sure enough, after a few days, on developing the plate, he found a perfectly distinct impression of the crystals pictured there. Now the thing that Mr. Strutt, in common with physicists generally, finds so extraordinary and downright unparalleled is that, notwithstanding this successful issue of a quasi-prediction, it nevertheless turned out, as he says, (1) that the green fluorescence of the glass of Crookes's tubes has *nothing to do* with the production of Röntgen rays; (2) that the green fluorescence of uranium salts has no connection with their effect on photographic plates, and (3) that those uranium rays which affected the plates are of a radically different nature from the Röntgen rays which duplicate the effect. It was, indeed, a remarkable case, conveying the important lesson, not that prediction or quasi-prediction is not a vitally important factor of physical research, far less that it is unscientific or even anti-scientific, as Professor Pearson contends, but that one or two fulfilments of predictions do not suffice to prove that the hypothesis upon which they are based is so much as a recognizable likeness of the real truth. The experience of Becquerel was, it is true, not so unprecedented as Mr. Strutt represents it to have been. He goes too far in saying that the Röntgen rays, the uranium invisible rays, and the green phosphorescence "have nothing to do with" one another. It can hardly be doubted that there is *some* connection between them, although we cannot say what it is, and although the phenomena are certainly not directly allied. Mr. Strutt can surely have no difficulty in calling to mind many and many a chemical induction, virtually predictive, which went on swimmingly for a long time and then broke down so one-horse-shay-ly that the favorable instances seem to us little more than accidental coincidences. Probably, however, time will show that they were not so utterly fortuitous as they at present seem to have been.

Several of Mr. Strutt's positions in the logic of science are questionable; but whenever he has set forth his reasons they appear very strong and very interesting, even if not fully convincing. Against his mode of attacking the substantiality of matter and his argument in favor of electricity as the only subject of spatial motion, it is impossible to hold out. (We speak of *his argument*, which, however, neither is nor professes to be absolutely demonstrative.) His doctrine of the transmutation of the elements is peculiar in making the course of development to proceed from elements of high atomic weight to elements of lower atomic weight. Moreover, he makes the transmutations run along the horizontal lines of Mendeléeff's table. The brilliant ingenuity exhibited by Curie, Ramsay, Rutherford, etc., in all these researches, and their astounding marvels of manipulative skill, are now an old story, perhaps; but, as narrated in Mr. Strütt's book, they appear more real and more fabulous than ever.

The Tomboy at Work. By Jeannette L. Gilder. Doubleday, Page & Co.

In this sequel to her 'Autobiography of a Tomboy,' Miss Gilder makes her heroine tell the tale of her first year's work. Her strenuous career began when, at the age of fifteen, she was engaged by a historian of the civil war to search the records in the Adjutant-General's Office at Trenton. To do this work, she had to take the six o'clock train every morning from Birdlington, but this only lent zest to the employment. At sixteen, "Miss Gilbert" obtained work in the Mint in Philadelphia. There she had to weigh gold, and, when gold was scarce, to make canton flannel bags to hold it when it should begin to come in again. From the Mint she went with her family to Newark, and at first colored photographs for a living. Then came an appointment in an auditor's office, where, as she was quite unable to add figures correctly, the head clerk obligingly did her work as well as his own, declaring himself more than repaid by her whistling of tunes from the Italian opera. Next came a post as proofreader, then another as copyist in the office of the Registrar of Deeds. Finally, at about eighteen, as far as we can calculate, this enterprising young woman, having already discarded five or six different pursuits, settled down as a newspaper writer in Newark.

But hers was not the temperament that enjoys being settled, and she is soon in New York interviewing "the proprietor of the most famous newspaper. . . . The interview was short. 'Well,' said he, regarding me with piercing eyes, 'what do you want to do?' 'I should like book-reviewing, or anything that comes to hand.' 'You can do the books, if you like,' said he, 'but be original; don't give us the same old cut-and-dried stuff. Your salary will be $30 a week—good morning!'" No wonder that "Miss Gilbert" had to restrain an impulse to drop on her knees and kiss his "strong, shapely hand." In order not to be cut-and-dried, on the advice of Miss Kate Field she wrote her reviews in dialogue form: "I had a family take up the books of the day and discuss them, giving

various opinions; the sons and daughters maintaining a point that was immediately bowled over by the father." This method proved a great success—a fact which seems to show that there was more leisure in those days in which to read one's morning paper, or more interest in current literature. Our heroine rose to be musical and dramatic critic of the same paper. (She withholds its name, with unusual reserve.) As her family still lived in Newark, she used to go home by the midnight train, and proceeded to write plays from one till three. The performance of one of these plays in Philadelphia is one of the most amusing episodes in the book. We leave her "still a journalist, and still in harness, though the harness is light."

Miss Gilder writes in a breezy and unconventional style, suitable to the pace at which her tomboy lived and changed professions. It is not for us to disentangle fact from fiction in this account of the life of an energetic young American. We commend it to the notice of certain English writers, who seem to think that every American woman, unless she is absolutely without social position, leads an idle life at the expense of heart-breaking toil on the part of the American man. Nothing could be more American than the atmosphere and point of view of this book. "Miss Gilbert" is the incarnation of the American spirit. The story of her career is a record of the triumph of the self-confident amateur who can because he thinks he can. The illustrations are in keeping with the work—a trifle undignified, but expressive.

A Notable Book on India

By an Irishwoman who has lived in Calcutta.

The Web of Indian Life

By THE SISTER NIVEDITA

301 pp. 8vo, $2.25 *net* (by mail $2.36).

Evening Post: "A sympathetic student of Indian literature and philosophy. . . . Marked by the discrimination of a candid observer and an intelligent student of origins. . . . Sister Nivedita has evidently prepared herself by wide study. . . . Her enthusiasms are weighed and tempered. . . . She has done notable service by her keenly sympathetic interpretation of Hindu aspirations, as well as by her proof of the effaceable results of foreign rule."

Boston Transcript: "She works herself into the very skin of the devout Oriental."

London Daily News: "The writer reveals the deep spirit which moves beneath the surface."

*** Another noteworthy book on India is Chevrillon's "In India" ($1.50).

Asia and Europe

Studies presenting the conclusions formed by the author in a long life devoted to the subject of the relations between Asia and Europe.

By MEREDITH TOWNSEND.

Third Edition, revised. 8vo, net, $2.50.

"This book may claim a higher distinction than being classed as a book 'worth reading'—it ought to be read. The first duty of a world's power is to know the world. An Eastern colony of our own, a leading factor in the Chinese settlement and a marvellously increasing export trade throughout the East make it necessary for us to understand the people with whom we are having such relations.

"Mr. Townsend gives valuable food for reflection; he knows his subject thoroughly and honestly and fearlessly expresses his opinions."—*Presbyterian Banner.*

NEW SCRIBNER BOOKS

THE LIFE OF REASON

or The Phases of Human Progress

By GEORGE SANTAYANA, Assistant Professor of Philosophy at Harvard University

ALTOGETHER the most important recent work in philosophy by an American, or perhaps by a scholar of any nationality. The two volumes, **Reason in Common Sense** and **Reason in Society,** consider each so different an aspect of the general subject—individual, social, religious, artistic, scientific—that they may very well be considered separate works. Prof. Santayana's view of the universe and its problems is more or less a variant of the phase of philosophy known as "pragmatism," but it is the most original and brilliant statement of this general view that has yet been made.

Two volumes, each 12mo, $1.25 *net* (postage extra)

REASON IN COMMON SENSE

1.—The Birth of Reason
2.—First Steps and First Fluctuations
3.—Discovery of Natural Objects
4.—On Some Critics of This Discovery
5.—Nature Unified and Mind Discerned
6.—Discovery of Fellow Minds
7.—Concretions in Discourse and in Existence
8.—Relative Values of Things and Ideas
9.—How Thought Is Practical
10.—The Measure of Values in Reflection
11.—Abstract Conditions of the Ideal
12.—Flux and Constancy in Human Nature

REASON IN SOCIETY

1.—Love
2.—The Family
3.—Industry, Government and War
4.—The Aristocratic Ideal
5.—Democracy
6.—Free Society
7.—Patriotism
8.—Ideal Society

A NEW VOLUME OF "LITERARY LIVES"

COVENTRY PATMORE

By EDMUND GOSSE

Illustrated, 12mo. $1.00 *net* (postage 10 cents)

A new volume in this successful series distinguished by rare discernment. Mr. Gosse's estimate of Patmore's accomplishment and his place in literature is one of uncommon interest.

CONTENTS

1.—Early Years (1823-1846)
2.—Life in London (1846-1862)
3.—"The Angel in the House"

AN EDUCATIONAL DIRECTORY

I.—The NATION stands alone in its field. It has a larger circulation than any other politico-literary journal published in this country, going to all the principal libraries and reading-rooms, and into thousands of families.

II.—The circulation is chiefly among the thinking and well-to-do classes—lawyers, physicians, bankers, and other professional men—and in the homes of cultivated people, where the education of children is a matter of careful consideration.

III.—The School List in the NATION has been a representative one for many years. It includes cards of many of the most prominent educational institutions everywhere, during the season of school advertising, and a considerable number are inserted in the paper throughout the year.

IV.—The rate is reasonable, and discounts are made on continuous insertions, of which most of the school advertisers avail themselves.

School advertisements are printed in a uniform typography, with the address in the first line, classification being made by States, alphabetically, unless especially ordered displayed.

Advertising rates, 15 cents an agate line each insertion, with the following discounts: 5 per cent. on 4 insertions, 10 per cent. on 8 insertions, 12½ per cent. on 13 insertions, 15 per cent. on 26 insertions, 20 per cent. on 39 insertions, 25 per cent. on 52 insertions.

The *Nation* is sent free while advertisement continues.

Orders may be forwarded through any responsible advertising agency, or directly to

A NEW AND CHEAPER EDITION OF

Allbutt's System of Medicine

The best of the world's knowledge on every branch of medical practice is here given with such even excellence that the work has been the accepted standard since its first issue.

Price of the new edition, in every way identical with the first issue (at $45 net) is $25 net. Send for special cash or instalment rates and for a descriptive circular.

Labor Problems

By THOMAS SEWALL ADAMS, Ph.D., University of Wisconsin, and HELEN L. SUMNER, A.B.
Cloth, $1.60 net. (Postage 13c.)

Poverty

By ROBERT HUNTER. Contains the notable discussion of the conditions of child life in New York which aroused such vigorous feeling very recently.
Cloth, 12mo, $1.50 net. (Postage 12c.)

The Life of Florence Nightingale

By SARAH A. TOOLEY, author of "Personal Life of Queen Victoria," "Life of Alexandra," etc. With twenty-two illustrations. *Cloth, 12mo, $1.75 net*

The New York Public School

Being a History of Free Education in the City of New York. By A. EMERSON PALMER, M.A., Secretary of the Board of Education. Illustrated with 16 full-page plates.
Cloth. 12mo. Ready next week

NEW NOVELS

Mr. Eden Phillpotts' *new novel* The Secret Woman

"is not only the best novel he has written, but also one of the greatest novels of the decade . . . The drama maintains its intense interest through every change to the exciting close."

By the Author of "The American Prisoner." With frontispiece. *Cloth, $1.50*

SARA ANDREW SHAFER'S

Beyond Chance of Change

By the author of, and in the same vein as that delightfully genuine and beautiful "The Day Before Yesterday."
Cloth, $1.50

CYRUS TOWNSEND BRADY'S

The Two Captains

is a lively story, full of exciting interest and romance of the times of Bonaparte and Nelson. *Illustrated. Cloth, $1.50*

L. H. HAMMOND'S

The Master-Word

is a keenly interesting picture of modern phases of the race-relations in Tennessee. *Cloth, $1.50*

CHARLES EGBERT CRADDOCK'S

The Storm Centre

is a war story, but even more a love story, by the author of "The Prophet of Great Smoky Mountain."
Cloth, 12mo, $1.50

THE MACMILLAN COMPANY, Publishers, 66 Fifth Ave., New York

The Nation.

NEW YORK, THURSDAY, FEBRUARY 9, 1905.

The Week.

The full text of President Roosevelt's extraordinary "agreement and covenant" with President Morales of San Domingo is an amazing document. It gives the lie to the belated and apologetic explanation of the State Department that this "protocol" was simply "a memorandum of a proposed agreement." This is the agreement itself. Nowhere within the four corners of it is there a hint that this instrument was to be submitted to the Senate, or any other body. "The American Government agrees"—the American Government guarantees"; and the thing was "done," not proposed —the agreement to "begin to take effect from and after the first of February," signatures having been affixed on January 20. Evidently there was no dream of asking the consent of the Senate. Messrs. Roosevelt and Hay had constituted themselves "the American Government," with final power to bind this country to put down revolutions in a foreign republic and to administer its finances. They have since been driven in alarm from that assumption. Now they propose to draw a treaty in due form, and consent to look at the Constitution.

In the London *Times* of January 24 is a long letter from its West Indian correspondent setting forth conditions in San Domingo. Revolution has been chronic for years. No so-called President is long left in office undisturbed. Apparently, the *de facto* President, Morales, has shrewdly conceived the plan of inducing the Americans to step in and take his revolutions off his hands. Clause 7 of the famous agreement binds the American Government, "at the request of the Dominican Republic," to "*preserve order*." In other words, Morales may comfortably disband his army and turn over to us the work of keeping Dominican conspirators and incendiaries in order. It is a sharp bargain for him to drive. Perhaps he learned such cleverness when a clerk in a German-American store in Sanchez. Afterwards an unfrocked priest, then a revolutionary, then a President in unstable equilibrium, he has been smart enough to make a cat's-paw of Uncle Sam. But the Senate will have a word to say. What it should most closely guard against is the peril lest the President go lawlessly ahead in San Domingo, as he did in Panama, to create a situation from which he will say it is impossible to withdraw.

Unquestionably, this year's inauguration parade will beat anything hitherto seen in the circus world. First will come the Rough Riders, the regiment famed for having obtained greater renown and more offices for less fighting than any other in the world's history. Next will march the battalion of Filipino scouts which has been kept in the country for this purpose since the close of the St. Louis Exhibition, although their services are needed in the archipelago. Next in order will come Geronimo, the greatest of Apache warriors; American Horse, who led the Cheyennes on many a warpath; and Hollow Horn Bear, the Sioux chieftain. Sailors from the fleet, soldiers from the forts, cadets from West Point and Annapolis, will be next, while the presence of thousands of college men will show how the youth of the country approve the strenuous life. We respectfully offer the following suggestions for additional features certain to attract the public: Delegations of railroad presidents favoring the imposition of rates, led by Paul Morton, with William J. Bryan as first assistant; 100—"count them"—100 bishops opposed to divorce and led by Bishop Hare, fresh from the sale of his Protestant mission schools; the entire Republic of Panama, 250 strong, William Nelson Cromwell, chief marshal; three hundred Dominicans, headed by President Morales, marching in a square of American rapid-fire guns; and President Castro, with the Venezuelan army bearing specimens of asphalt in place of arms.

The General Staff of the army, just a year and a half old, already stands condemned. We had foreseen certain dangers, but must confess that we had overlooked those which have compelled Senator Hale to denounce the new body in unmitigated terms, and to record his opposition to any similar staff for the navy. Senator Hale's experience with the General Staff autocrats has been sad indeed. Hearing that Congress had appropriated $500,000 for post recreation buildings, he went to the War Department, as in the good old days, to fix with the Secretary just how much of this should go to Maine. To his horror the Secretary denied any authority in the matter, and brutally referred him to the General Staff, which, said Mr. Taft, would give the Senator a hearing if he asked for it. Such an insult to the dignity of a United States Senator engaged in the legitimate business of hunting for pie for his constituents was unheard of. Spurning the hearing, Mr. Hale strode back to the Senate, and in his wrath launched a philippic at this body which dares to stand between a Senator and a bit of patronage. Naturally, in Mr. Hale's eyes, the Secretary of War has shrunk—even if it be by his own wish—to a mere nobody, while the General Staff has usurped all his legitimate functions. With the country and the Constitution thus in danger, Mr. Hale thunders well.

Every one must admire Secretary Taft's persistence in going before Congress and asking for a reduction of the Philippine tariff. Although appealing to his own party, he might, from the look of things, plead as well for common schools in Liberia or for the single-tax in Hayti. Congress is simply no longer interested in the Philippines—proof of the hollowness of the Imperialistic contentions of four or five years ago. Then we were assured that we might trust in the wisdom of Congress as in an all-wise Providence; that the responsibility for the millions of Filipinos would make Congress always eager to do everything possible for the archipelago, with the result that our own politics would be vastly purified. Well, we now see how it actually works. The President and the Secretary of War go down on their knees to Congress for the simplest act of justice to the Filipinos imaginable—all in vain. Special messages and the arguments of Mr. Taft are alike futile. Even the threat of Secretary Taft to come out for free trade another year if a reasonable reduction be refused now, has fallen perfectly flat. Indifference and the influence of the protected interests prevent his own party from moving, while the Democratic leader, Representative Williams, has stolen his thunder by introducing a free-trade bill. For the Filipinos this measure is far more vital than the regulation of railroad rates for this country. But we hear no talk of an extra session, and the "man in the White House who does things" is helpless to aid a cause which must appeal to every one's chivalry and sense of what is really a "square deal."

Although the bill authorizing railroad construction in the Philippines was considerably bettered by amendments previous to its receiving the President's signature on Monday, we can but think the precedent of a Government guarantee of 4 per cent. on thirty millions of railroad bonds vicious. Already people are saying that a scheme like this which primarily benefits large capitalists, finds favor with Congress, but that tariff reduction in the interests of the masses can obtain no hearing. Secretary Taft, it must be recorded, did not forget in his hour of success on Monday to speak again for his tariff demands. He is greatly gratified to have made the Philippine Government a partner in the

railroad business. There is no good reason now why it should not similarly go into partnership with steamship companies for the purpose of building up a trade in American bottoms with China or India or Australia, to say nothing of the United States. Then there is the coastwise trade, which would benefit by a 4 per cent. Government guarantee of first mortgages. How this guarantee will work in practice remains to be seen. An incentive to railroad efficiency it cannot be said to be. And in the event of a foreclosure, there is no other alternative than Government ownership or management.

The Statehood bill was introduced in the House on April 4, 1904, after the Committee on Territories had worked over the collection of Statehood bills offered by individual members. Four days after its introduction it was reported favorably. For eleven days it was on the calendar. Then, on April 19, it was taken up shortly after noon, under a special rule which prohibited all amendments, debated for three and a half hours, and passed. The Senate Committee kept it under consideration for the rest of that session, and reported it, with amendments, on December 16. It was called up on January 4. Since then, it has been discussed almost daily. Where the House gave but a few hours, the Senate has had the measure up for debate during thirty-three days. All the Senators especially interested have had an opportunity to speak. Important amendments have been proposed and discussed, details have been perfected. The debate in the House was a pure formality. In the Senate, where party lines have not been strictly drawn, it has been to some degree a genuine interchange of ideas. Even the final vote on Tuesday was marked by deliberation and independence, if also by a necessary exhibition of strategy, for the body was very evenly divided. In the end Mr. Foraker and his supporters carried the day. Arizona was sidetracked, and New Mexico and the combined Indian Territory and Oklahoma alone were conceded admission as States. The matter now reverts to the House and probably to a conference committee.

In spite of the rumor that the Senate Committee on Privileges and Elections will decide adversely to Senator Smoot, the comments of the press throughout the country seem to show that the trend of feeling just now is rather in his favor. As a matter of fact, the public has never quite known what to think about the Mormon Senator, and has caught at every suggestion eagerly. "What is to be done about this?" was the query when the news first came that the Utah Legislature had chosen an apostle to represent the State. "He has only one wife," the dispatches announced at once. "Oh, very well," said the public, with relief, and Mr. Smoot was sworn in with none of the hubbub that attended the advent of Roberts at Washington. Then came the testimony of the polygamous relations of the head men in the Church. "So this is the sort of crowd Smoot consorts with!" was the horrified exclamation. A popular vote last March would have expelled the Senator with scant courtesy. But the attempted demonstration of Church control in politics was not clear enough to startle anybody, and Mr. Smoot's excellent personal reputation has told in his favor. "The question is," said one newspaper, "can a Mormon be a good citizen? We are compelled to admit that in Mr. Smoot's case, at leas' he can." As the facts stand, this is not an issue on which conscientious people can be expected to agree. The sentiment against Smoot has naturally been more audibly manifested, but the favorable view has acquired considerable support.

It is a rough-and-ready solution of the immigration problem which the House Committee on Immigration and Naturalization endorses by voting to report favorably the Adams bill. It proceeds, in fact, on much the same principles that a police officer applies when in charge of a building that is in danger from overcrowding. "How many more will it stand?" "Three hundred more." "All right; let in that many, and then close the doors." Just so the Adams bill makes an estimate of the number of foreigners of the so-called "undesirable" races which the country can safely take in. Having fixed this number at 80,000 for each country, it proposes to close the gates in the face of No. 80,001. As a matter of fact, there are only three countries which send more than 80,000 a year as it is. These are Italy, Austria-Hungary, and Russia. Had they each been cut down to 80,000 last year, the total number of aliens admitted would have been reduced by 275,593, or about one-third. If the 200,000 arriving Italians could be stood up for comparison and the best 80,000 picked out for admission, it is self-evident that the average would be much higher than at present. The sifting process applied to immigrants as they come would necessarily be less perfect, while if it were stringent enough actually to select the most promising two out of every five, the fixing of a maximum number would become superfluous.

The more the Government seed distribution is talked over in Congress, the more chance there may be of its ultimate abolition or reform. Meanwhile, neither side in the discussion can expect its reasoning to possess the charm of novelty. Just a decade ago the same arguments used by Mr. Lodge and the Senators who took issue with him on Thursday were being propounded in House and Senate. The Congress then in session was the one elected with Mr. Cleveland, and was pledged to a programme of economy. The new Secretary of Agriculture, Mr. J. Sterling Morton, saw in the seed distribution an opportunity for retrenchment and urged it upon Congress. Yet the House voted down, by the tremendous majority of 3 to 47, an amendment reducing the seed appropriation from $180,000 to $56,000. On the same day an amendment by Mr. Williams of Mississippi was defeated, putting the seed distribution in the hands of the agricultural colleges and experiment stations instead of the members of Congress. Theories about the proper functions of government have never been controlling in this matter. It is undoubtedly true that the distribution has been made more intelligently of late years; at least allotments have been made with more knowledge of local needs. They ought, accordingly, to be more appreciated. In one year the Secretary of Agriculture reported that out of 1,800,000 persons who received free seeds, 940 sent acknowledgements, and in almost every one of these cases incidentally asked for more.

If the manufacturers of alcoholic preparations, articles of iron, steel, and lead, or products made from sugar and molasses, are permitted to obtain a drawback on the imported raw materials entering into articles for export, even when they are inextricably mixed with domestic materials, it seems fair and reasonable to let flour millers do the same thing. It appears from Attorney-General Moody's opinion in the matter of the Canadian wheat drawback, that "a very large proportion" of the $5,000,000 paid as drawbacks during 1903 "was paid upon the exportation of manufactures in which the imported and domestic materials were so blended that they were not apparent to the sight or other senses, and could only be ascertained by the manufacturer's record." Thus, by interpretation of the existing law, there has been accomplished one of the objects of proposed new legislation for liberalizing the drawback ssytem. The word comes promptly from Minneapolis that the new ruling will be a great thing for the farmers of this country. Of course, the only reason the millers had for desiring the new ruling was that they wanted to buy Canadian hard wheat instead of American, which costs more. But the Canadian hard wheat will always be mixed with American soft wheat; and, as the exports of flour increase with the lower price, the American farmer will find a better demand for that soft wheat in order that it may go into the mixture. The duty of 25 cents a bushel on wheat, we have always known, was a blessing to

the farmer; but the invention of a means of escaping that duty on one class of imported wheat is also a blessing to him.

It is a strange thing for protectionists to be hallooing about. Free-traders may properly hail it as a kind of payment on account, a belated and forced recognition of one of their principles; but it is a blow at the very vitals of protection. If drawbacks may nullify protective duties on wool and hides, what becomes of the grand log-rolling game of grab for all and grab for each? Who will weep for the Ohio Shepherds? They will not like free trade by judicial interpretation any better than at the hands of President Roosevelt's wicked counsellors of the closet. Besides, how long can the smartest nation on earth be expected to submit to the howling absurdity of what is now proposed? We are going to strain every nerve to supply the good things of life cheap—to foreigners. We are to rack the Dingley law in order to intensify the existing feeling against protective tariffs, on account of their enabling manufacturers to make their fellow-citizens pay them more than Englishmen or Frenchmen or Germans for the same goods. That the foreigner should get American flour at lower rates than Americans can; that American shoes should be sold abroad much cheaper than at home; that American woollens should be put within the reach of foreign workingmen, while our own are forced to wear cotton or shoddy—this is trumpeted as the latest glory of protection!

How far the Hay-Bond treaty has been modified in Senate committee has not been told, but it is obviously a triumph to get Senator Lodge to assent to it on any terms. In past time he has always taken the ground that by any permissible arrangement with Newfoundland the Gloucester fishermen may get, but must never give. He has, moreover, under his particular care the protected industry of herring smuggling. The Gloucester herring dealers buy the fish of the Newfoundland seiners, and then, by a self-stultification of the Dingley tariff which other importers who pay their duties may well envy, enter the fish free at American ports. Evidently, any reciprocity agreement making Newfoundland fish free may interfere with this thriving traffic. The Blue-nose fishermen would doubtless be glad to sell the herring direct, instead of to the Gloucester freighters. Still, however Mr. Lodge may have been appeased, he is wise in yielding to the overwhelming reciprocity sentiment in his State, and the treaty should be promptly passed, not only because it promises considerable mutual advantage, but because of its tactical value also. It will be a strong argument for Sir Wilfrid Laurier's dropping the indifference he has assumed, perhaps for purposes of diplomatic coquetry, and resuming an expectant attitude concerning reciprocity between Canada and this country.

That consistent protectionism has its difficulties is clearly shown by "The Bystander" in the Toronto *Sun*. It appears that Mr. Chamberlain's Tariff Reform League has sent out its circulars in German envelopes. Worse yet, the high priest of Imperial reciprocity, Mr. Pearson, has been detected in printing one of his publications in Holland, and has added concealment to the original offence. Only by the bad luck that besets new movements did one or two copies, still bearing the tell-tale imprint, fall into the hands of malicious Little Englanders. A more fundamental lapse from sound protectionist practice was revealed when some meddlesome person turned up one of the six thousand folding chairs provided for Chamberlain's meetings. Under the seat was plainly seen the damning inscription: "Made in Russia." If righteousness is absent in the very chieftains of "trading with ourselves," what are we to expect from the rank and file? Celestial ire against the free traders is nourished daily by French and Spanish wines, and the swelling bosom of the orator for home industries is usually covered by a German linen shirt. Until the Chamberlainites show the stern fibre of those colonial dames who cheered their spinning by copious draughts of raspberry tea, one may despair of the conversion of England from the free-trade fetish.

Bryan's enthusiastic endorsement of Roosevelt has scarcely more awkwardness for the latter than has, for Mr. Balfour, Chamberlain's effusive identification of his views with those of the Prime Minister. Chamberlainism is evidently on the down grade. Bye-election after bye-election gives it an added shove. Coincidently, Mr. Balfour becomes philosophically more detached and indifferent as respects this tiresome (and politically ruinous) fiscal policy. In his more recent speeches he has had no occasion so much as to mention Mr. Chamberlain's name. How vexatious, then, for the latter to write, as he did the other day, to a Conservative candidate: "I do not myself recognize any differences of principle between Mr. Balfour and myself. If we differ at all, it is only on a question of methods and tactics." And the worst of this is, that the chief question of "tactics" between the two is as to a speedy dissolution of Parliament and a general election. Mr. Chamberlain has said that it cannot come too soon to suit him; but Mr. Balfour has none of the rash spirit which would rush upon death. However, Chamberlain undoubtedly has it in his power to force a dissolution, and the chief interest of the coming session will lie in his decision to use it or not.

Gripenberg's reverse on the Hun River, while not of the magnitude of the great battles below Liaoyang and Mukden, was evidently more than the failure of a reconnoissance in force. The fighting lasted five days, and the losses exceeded 20,000 on both sides. The movement must be interpreted in the light of Mitshenko's recent raid towards Niuchwang, and the whole previous strategy of the Japanese. Mitshenko demonstrated that the Japanese left flank might easily be turned by a mobile force. Half a dozen major engagements from Telissu to the Sha-ho had proved the impossibility of detaching the Japanese army from its positions at the roots of the Mountains. So it seems that Gripenberg tried to profit by the hint of the cavalry raid and fight in the level stretches of the Hun Valley. His initial attack met with success, but he was finally driven back, on January 29, to his old positions. From the fact that the regular counter movement against the Russian left, which in half a dozen instances has proved successful in the past, was not pushed vigorously, we get an indication that Oyama is no longer in commanding numerical superiority, and that the present deadlock is likely to continue until spring.

The statistics of the mortality in Gen. Oku's army, published on Thursday, would seem incredible had not Major Lewis L. Seaman prepared the American public for the astonishing figures. No nation and no army ever made such a record before. From May 6 to December 19, during seven and a half months of the hardest kind of campaigning, there were actually only forty deaths from disease out of 24,642 cases. Not more than 193 men came down with typhoid, hitherto the scourge of all modern armies, and practically all of the beriberi patients were restored to health. American and European army surgeons must doff their hats to the Japanese. Take our own record in 1898. We put into the field during a similar period (from May 1 to December 31) about 275,000 men, of whom no less than 4,965 officers and men died of disease—nine-tenths of them in peaceful camps within our own territory. Doubtless, Gen. Oku's army was not as large as our levies of 1898; perhaps he had only half as many men. But when one considers the relative conditions of the two armies, it is now more than ever plain that several thousand of our war victims were needlessly destroyed by their own folly or because of the incompetence of their officers. When the exact strength of Oku's army becomes known, the figures we are commenting on will doubtless afford still more striking lessons for our General Staff.

TRUST FUNDS FOR CATHOLIC SCHOOLS.

A dozen years ago the Government announced that payments to sectarian missionary societies for carrying on boarding schools among the Indians would be reduced a certain percentage each year till the system disappeared. For a time, however, the Government gave the schools the rations and annuities assigned to the children who were in attendance. In 1901 the Commissioner of Indian Affairs, W. A. Jones, issued an order to stop this practice, as it was in evident violation of the spirit of the act of Congress. William H. Hare, the Protestant Episcopal missionary bishop of South Dakota, remonstrated in behalf of his schools, but the Secretary of the Interior and the Attorney-General sustained Commissioner Jones in his contention that the department had no authority to favor sectarian schools. Bishop Hare closed two of his missions and sold them at a heavy sacrifice. The Catholics were exceedingly eager to retain their allowances, and Dr. E. L. Scharf, a Catholic in Washington, promised Senator Bard of the Committee on Indian Affairs that, if Congress would appropriate $150,000 for two years, the Catholics would stand by the Administration in twenty doubtful Congressional districts. Congress failed to make the desired appropriations; but, upon representations from Charles J. Bonaparte and others, President Roosevelt ordered $98,460 of Indian trust funds paid to Catholic missions and $4,320 to a Lutheran mission. The pretext under which this money was devoted to sectarian purposes was that the Indians had petitioned for such a disposition of their property.

On Friday last, Father William H. Ketcham, director of the Bureau of Catholic Indian Missions, presented to the Senate Committee on Indian Affairs a communication addressed to President Roosevelt by Attorney-General Moody, on the subject. This official "explanation and justification" of the diversion of a trust is labored and unconvincing. The opinion of Mr. Knox, as summarized and transmitted by Mr. Moody, is that the Administration is technically within the law. When Congress explicitly declared against State aid for sectarian schools, it merely meant that Congress itself would not lend further aid; the Executive was still free to dispose of funds in its keeping. When Congress said in 1899, "This being the final appropriation for sectarian schools," it merely meant that this was the final appropriation from Congress itself; the Executive could still appropriate from the trust funds. In fine, the principle of Government partnership in sectarian missions, which, whenever Congress tried to apply it, proved so corrupting, so subversive of American ideals of religious equality, might become, in the hands of an all-wise and omnipotent Executive, most beneficent and impartial. Congress tried to apportion hundreds of thousands of dollars fairly between Protestant and Catholic schools; but still there would be wire-pulling, low intrigue, and an unedifying scramble for sectarian advantage. But when the Executive, on the basis of a sneak petition, gives $98,460 to the Catholics and $4,320 to the Lutherans, and disregards all other denominations, nobody can have the slightest ground of complaint. Quibble is the only word to apply to this defence of the Administration.

The scandal has been further illuminated by a letter from the President to Secretary Hitchcock defending the legality of the act, and a heated attack on the *Evening Post* by Charles J. Bonaparte of Baltimore, for having said that Mr. Bonaparte described as "small people engaged in small and dirty work" those who objected to the payment of $98,460 from the trust funds to the Catholic schools. Mr. Bonaparte declares he intended these harsh words only for people who think Dr. E. L. Scharf spoke for the Catholic Church, and who are trying to "use a trivial incident" to "revive sectarian prejudices and animosities." No one, of course, supposes that Dr. Scharf was a formally authorized agent of the Catholic Church. But that he represented a strong Catholic influence in Washington—an "ecclesiastical lobby" is Dr. Lyman Abbott's term—no one can deny. As the people who are protesting against the diversion of funds are the very ones who, if any, may be accused of "using this trivial incident," Mr. Bonaparte's distinction seems verbal rather than real.

The President relies for his justification upon the opinion of the Attorney-General. Granting for the moment the legality of the President's course, we cannot reconcile it with any theory of fairness. The Commissioner of Indian Affairs, at that time Mr. Jones, had told all the managers of mission schools that they were to receive nothing from the Government. If the President desired to reverse this policy, he should have given an equal chance to all the sects to circulate petitions among the Indians and secure their share. Instead of being an open and above-board transaction, this was carried under a blanket. A petition was handed about quietly by friends of the Catholics; Indians were in some instances bribed to sign—a loaf of bread to each signer; and on the basis of these preposterous documents, representing a minute fraction of the tribes, nearly $100,000 of trust funds was turned over to the Catholics. Coupled with this is the ugly coincidence that a Catholic in Washington had been talking to a member of the Senate Committee on Indian Affairs about Catholic influence in twenty doubtful Congressional districts; and had been making threats to a member of the Lower House.

Had the President publicly promulgated this plan of appropriation by petition, he would instantly have got both himself and the Indians into hot water. The representatives of the various denominations would have been pulling and hauling for signatures. Against the single loaf bid by the Catholics, the Presbyterians could offer two, the Methodists a blanket, and the Episcopalians a rifle. The reservations would be torn with disgraceful squabbles. In fine, the principle which the President now avows —"unless Congress should decree to the contrary," or "unless the courts should decide that the decision of the Department of Justice is erroneous"—would, if all sects were granted a fair field and no favor, be a terrible blow to Indian education and progress.

The President also remarks:

> "Care must be taken to see that any petition by the Indians is genuine, and that the money appropriated for any given school represents only the pro-rata proportion to which the Indians making the petition are entitled."

In the cases in question no such care seems to have been exercised. Against the genuineness of the petitions a considerable body of evidence is to be found in the *Congressional Record*, from which it would appear that more Indians oppose than favor the diversion of the trust funds. Why the President should assume responsibility for an order to sequestrate the common property of a tribe, and should honor such a suspicious and discredited draft, no one has hitherto explained. If Bishop Hare and others are to be believed, a very slight inquiry would have revealed the flimsy character of these petitions.

The President is now much concerned that the Catholic schools get "only the pro-rata proportion to which the Indians making the petitions are entitled." But we have the authority of Mr. Brosius, agent of the Indian Rights Association, for two very striking facts. Under the "pro-rata" plan the Holy Rosary Roman Catholic school at Pine Ridge would be entitled to $700. It receives this year $21,600, drawn from the funds of the whole tribe. The Catholic schools at Pine Ridge, Rosebud, and Crow Creek, taken together, would be entitled to but $1,803. They receive $55,620. This is an excess payment of $53,817, abstracted from the shares of the Indians who are now protesting. The President's letter, we submit, can neither explain nor defend this gross injustice.

FIRMNESS—IN ROTATION.

To study the cases in which Mr. Roosevelt, according to the Washington correspondents, has put his foot down would be to gain a considerable understanding of the fascinating game of combined politics and statecraft which no

President has played more brilliantly. Mr. Roosevelt is always firm about something. Last week, for example, the *Tribune* reported him as determined to press the arbitration treaties. "He was never in greater earnest about anything," says a Western Senator. But the same dispatch admits that firmness on the subject of prompt legislation for interstate commerce has yielded to despair. Other papers learn that he is far from firm in the matter of prosecuting criminally the offending magnates of the Beef Trust. The Beef Trust directors, we are told, may either be put in jail or bidden to dinner; soon the President may take a firm stand one way or the other. In recent times he has been inexorably committed to tariff revision, to marriage reform, to a maximum naval programme—projects most of which are, after all, decidedly in abeyance. In fact, on pretty nearly all the issues on which we have been told that Mr. Roosevelt had chosen the "last ditch," his present attitude might, in stock-market parlance, be described as "firm but inactive."

We note the facts because they cast much light on a subject of concern to us all—Mr. Roosevelt's psychology. Why is he never simultaneously firm on all his pet measures, but generally decided only on one at a time, in a somewhat periodic rotation? First of all, no human frame, not even the President's, could stand the strain of working at once all the irons he keeps in the fire. And, next, even if he really desired to nail up all his theses in the same hour, a kind of boyish enthusiasm and a constitutional restlessness prevent his keeping many objects at once within emotional focus. We know that he rarely sees beyond the Kettle Hills in front of him, and one can imagine him clean forgetting an old cause in the enthusiasm for a new—quite as, on the memorable day before Santiago he may have wished the supply of hills was greater and their capture of hourly occurrence.

But no analysis of the Presidential mind is complete which makes him merely an *enfant terrible* of genius. To many it will recall Mr. John Sharp Williams's epigram on the underrating of Mr. Roosevelt's political ability, to discover that the President is most firm on the least pressing issues. His stubbornness on tariff reform has diminished in the ratio of Congressional opposition. To-day is an opportune time to present a grim front on the arbitration treaties; can we be so sure that a group of expostulant Senators to-morrow will not find him all amiability on arbitration, but thunderous on the preservation of the sanctity of the home? In short, the principle of rotation, so observable in the President's firmness, very often causes him to deliver his most formidable defiances simply at some unhappy man of straw.

Upon this fact we would comment in no unamiable spirit. It may be in some respects an admirable thing to combine the licensed audacities of the enthusiast with the politician's prudent avoidance of offence. It may be that by issuing numberless penultimatums, one breaks down opposition to the actual ultimatum when it comes. But firmness by rotation, like any other fixed method in a high official, must be judged by its fruits; and these are surprisingly few. In the Panama business Mr. Roosevelt could create a situation upon which Congress must act; in most matters involving a normal course of legislation, his success has been rather indifferent. It remains to be seen if he knows how to be firm at the moments when a great measure is really hanging in the balance, and what his firmness at such times weighs in the political scale.

But are there not matters in which Mr. Roosevelt can afford to be firm all the time? Is it not a mistake to treat an issue like rate regulation, corporation control, tariff revision, as if it were one of those eternal moral commonplaces concerning which fervor, though desirable, is not indispensable? We fancy that the President would have a longer record of achievement if he gave a freer hand to the Roosevelt the people know and like. The old hands in the Senate are openly derisive on the subject of Mr. Roosevelt's more obviously politic manœuvres; there is not one of them who does not fear and respect the dashing Roosevelt of popular legend. It is for this reason that we regret to see him at any time put himself in competition with the devilish sly. In so doing he sacrifices his natural advantages; the masterful way in which he imposed himself upon a lukewarm nominating convention is an example for him in dealing with a Congress too cynical to take safe enthusiasms at their face value. Direct methods become him best. He would have little respect for the pugilist who, when reminded that his adversary was ready, should say, "That can wait; meantime just see how I'm bruising this punching-bag."

Perhaps the culminating tribute to Mr. Roosevelt's popularity is the fact that a naturally humorous nation takes this almost daily changing of political hobbies with complete seriousness, and the average citizen still retains the picture of a stern and unbending Chief Magistrate. A prominent Congressman, and the President's very good friend, when asked if the repeated failure of Mr. Roosevelt's schemes in Congress would not in the end impair his prestige, answered: "Not in the least; everybody will say, 'What splendid things that young man would do if those old fools would only let him have his way!'"

THE PENDING STEP IN RAILWAY REGULATION.

There appears to be a growing sense at Washington and throughout the country that the proposed means of Federal railway regulation are disproportionate to the professed ends. No one has shown, the President least of all, that it is necessary, in order to abolish secret rebates, to lodge the rate-making power in the Government. That discriminations of every kind ought to be done away with, all agree; but it is not necessarily a sign of an obtuse mind or a dishonest purpose to ask just how rates fixed by the Interstate Commerce Commission are going to do it, or why a rigid enforcement of existing laws will not do it. Why should we reach for the poison of extreme legislation when the daily bread of laws now in the books will suffice us?

Let one point be fixed. No one seriously complains of railway rates in themselves. It is not objected that published freight rates are unreasonably high in many given localities, nor is it denied that the average rate is surprisingly low. It is much lower than on English or German railroads. On this head, the Interstate Commerce reports are explicit. In 1893 it was stated that "to-day extortionate charges are seldom the subject of complaint." "The concession is quite general among shippers that, with some exceptions, rates, as a whole, are low enough, and they often express surprise that the service can be rendered at prices charged." In March, 1898, the chairman of the Commission testified before the Senate committee that "the question of railroad charges which in and of themselves are extortionate is pretty much obsolete." The real crux of the matter is clearly put before us in the report of 1897: "The rate is of very little consequence to the merchant, provided it is the same to his competitors as to himself."

The great mischief to be undone lies just there. Railway managers assert that the practice of secret rebates has been almost entirely abandoned. Probably they do not believe this themselves. Certainly no one else does. Such cases as the Atchison rebate to the Colorado Fuel Company, with its ugly reflections upon President Roosevelt's friend and Secretary of the Navy, Mr. Paul Morton, suggest the too common method. Traffic managers are ordered to "get the business." They would be discharged if they did not. Knowing this, the big shippers prick up their ears and go after their illegal advantage. The process is criminal on both sides; but the temptation to either is too powerful, and the secret rebate is lawlessly made. By it one concern or individual is enabled to throttle a competitor; by it the railroads "get the business," but violate the law and do grievous injustice to thousands. Against this thing no words can be too hot or strong. Yet our indignation at this pub-

lic evil must not lead us to rush into a greater one in the hope of extirpating it, or make us blind to the effective remedies we already have in our hands, if we would but use them.

Needless legislation is always to be avoided; so much the more if ills we know not of lurk in it. A sober realization of this truth seems now to be gaining ground in Washington, even invading the White House. A Washington correspondent reports that the President is not altogether happy at having his railway legislation effusively endorsed by Bryan, and is now for a much less radical measure than he thought necessary two months ago. This process of conversion might happily go still further, we think, and finally persuade Mr. Roosevelt that what the Interstate Commerce Commission, or the Government, really needs is not "power over rates," but power over the violators of the law. He might begin by directing the Attorney-General to press with all vigor the suit which the Interstate Commerce Commission has just urged against the Atchison, for crimes approved, if not shared in, by Mr. Paul Morton.

The Republicans of the House held a caucus on Friday on the so-called Townsend bill. This is the measure reported by the Commerce Committee on Monday week, in place of the Hepburn bill of nine days before. Both bills were declared to have the approval of the Administration; so, we presume, will the next; and if no bill at all is passed, that result will just suit the President. He is always pleased with what is done. A comparison of the two bills reveals some points of superiority in the Townsend draft. It does not contemplate so many new offices and salaries as the Hepburn bill. But on its judicial side it is much less guarded. The Hepburn bill made careful provision for a judicial review of any ruling of the Commission, and for its suspension, pending review, upon giving a bond to reimburse any shipper for charges finally held to be unreasonable. But all this is stricken out of the Townsend bill. Neither project gives the railways any redress if the court should decide that a given rate imposed by the Commission is confiscatory. Apparently, the Committee's motto was, It is a good rule in railway legislation that works only one way. And now, whether the House ought or ought not to pass a bill giving the Interstate Commerce Commission power to make railroad rates, it ought not to do so in the way voted by the Republican caucus. The plan was to devote four hours to debate, to rule out all amendments, and to put through at a fixed hour to-day a bill involving the gravest Constitutional and practical questions. And it was Speaker Cannon, the angry stickler for the rights and privileges of the House as against the Senate, who was foremost in urging this stultification of the Representatives! That it amounts to this, who can dispute? The bill would not pass unless the House firmly believed that the Senate would either kill it or amend it out of all likeness to its original. This, of course, is simply to renounce the serious business of legislation, and turn it all over to the Senate. The latter body, of which the House professes to be jealous, is to be further exalted at the expense of the Representatives. They are ready, at the crack of the pistol, to give to the Commission a power of which the Commission itself says that "very few people not acquainted with the subject have any idea how difficult the solution of the problem is"; and to go obediently forward to enact legislation which President Roosevelt in his *first* message to Congress said would be "foolish."

FOOTBALL IN ITS PROPER LIGHT.

President Eliot has added to his long list of great public services by his analysis of the modern game of football, in his just published annual report. Like many another utterance of his, this must be regarded as the final word on the subject—at least until the modern game is thoroughly reformed. It is all the more notable coming as it does when Harvard College has abandoned its hitherto praiseworthy attitude in the matter of professional coaches in football and rowing, merely because of an undergraduate and graduate demand for victory. As the *Harvard Advocate* well put it: in rowing at least, pure amateurism has been thrown overboard. "We are paying primarily to have our crews win."

In football the desire to win has by itself worked evil enough; but the evil has been intensified by the preposterous publicity given to the game, nowhere so extensive as in the city which boasts most of its devotion to literature and art. The result is, that our young collegians conduct themselves after a defeat as if they had been cheated out of life's most cherished object. The torrent of "crude and vociferous criticism, blame, and praise" of which President Eliot speaks, is augmented by the complaints of graduates all over the country. They feel a personal grievance over a defeat, whether they live in California or in Florida. They petition athletic committees for a victory, in numbers and with an enthusiasm never called out for any genuine intellectual need of a college. As a result, there is no exaggeration in President Eliot's remark that the undergraduate mind is absorbed by this subject for two months at the beginning of every scholastic year.

With this opinion we believe that all college presidents would agree—within their confessional. In public, they continue muzzled on the whole subject. Realizing fully that the game has become a source of moral deterioration as well as of grave physical injury, they remain silent because they feel, with the general public, that success in football makes for the prosperity of the colleges. Or they evade the issue, as President Hadley did the other day, by saying that for presidents to talk about the sport only added to the exaggerated estimate of the importance of the game. But has the head of a great institution, charged with the moral welfare of thousands of students, the right to remain silent about a game which inculcates false ideals, stimulates trickery of all kinds, sets a premium upon strategems, surprises, and deceits, and is accompanied by a host of minor evils? President Eliot has for years been the educational pathfinder; in our opinion, his repeated assaults upon the game of football again emphasize his conspicuous intellectual and moral leadership. It is to be noted that this latest appeal of his is directed to the public, "especially the educated public," which he hopes to see take up this matter in earnest.

How can it fail to do so after hearing so convincingly that the main objection to the game is its moral quality? We have been deluded hitherto by the Roosevelts and other worshippers of brute force into thinking that there was something noble, inspiring, and uplifting in the crashing together of twenty-two men. Sophistical defenders of the game would have us believe that upon football alone hangs the whole physical and moral development of our youth; that the game produces not merely the sound mind and the sound body, but all the chivalric qualities pertaining to man. All this edifice of rant and sentiment comes toppling down in a heap the minute President Eliot's logical mind begins to expose the distrust and hostility between competing colleges; coaching from side lines; offside play; holding and disabling opponents by kneeing and kicking, by heavy blows on the head; trickery and deceit, etc. All these things there are rules to prevent. But at what games have these regulations of the play of gentlemen been obeyed or enforced? The profit from violating the rules is a never ceasing incentive to their transgression; and no umpire has yet been found who could see all the violations or the foul play visible from the grandstand. Only week before last a Harvard player, Mr. Roger A. Derby of this city, came out against "the extreme laxity of the officials," and let out the following secret:

> "In the Harvard-Pennsylvania game of 1904, among the many cases of foul play not punished was one striking example that militated against the best interests of sportsmanship and which was perfectly unpardonable. Both a Harvard player and a Pennsylvania player were at the same time found guilty of dirty playing, and were both ordered to leave the game. The captains of the two teams, however, mutually agreed to allow these men, valuable to their respective teams, to continue playing, provided the official gave his consent. The official gave his consent, and no changes were made."

If President Eliot had done nothing else, his denunciation of the theory that football is comparable to war would entitle him to the hearty thanks of that portion of the community which still concerns itself with college affairs. "In the consummate savagery called war"—itself a notable phrase—foul play of nearly all kinds is desirable. Spying, treachery, deceit, surprises, and tricks are the order of the day. The general who overwhelms a few with many receives the laurel; so, too, the "hero" who, by the lowest kind of strategy and by disguising himself in the enemy's uniform, captures a leader of the foe. In a manly sport participated in by friends there can be no justification for such methods. As President Eliot concludes:

> "Civilization has long been in possession of higher ethics than those of war, and experience has abundantly proved that the highest efficiency for service and the finest sort of courage in individual men may be accompanied by, and, indeed, spring from, unvarying generosity, gentleness, and good will."

We shall be disappointed indeed if the calm but incisive description of the evils of football by the head of Harvard does not produce a great effect, not only upon the public, but upon college faculties as well.

MIXING RESEARCH WITH BRAINS.

The third yearbook of the Carnegie Institution covers a bewildering roster of subjects from Chaucer lexicons to Desert laboratories, from Trans-Caspian archæology to an institution for experimental evolution; exact science always at the fore, and the humanities only exceptionally aided. But the scientists who so promptly obtained control of Mr. Carnegie's great foundation are beginning to justify their enterprise by results, and in particular by a very interesting attempt to survey and control scientific investigation. Under the title "Methods for Promoting Research in the Exact Sciences," Prof. Simon Newcomb has sent to five famous scholars representing physics, biology, astronomy, and mathematics a carefully framed scheme. He calls attention to the present unmanageable accumulation of the data of science, and advocates a bureau which should keep before investigators the real problems to be solved, and promote economy and accuracy in the gathering of statistics. The function of such a bureau, as Professor Schuster of Owens College, Manchester, points out, would be, "to place before the man of general science the main results of observations which want discussing, and, on the other hand, before the observer the main facts and measurements which the theoretical student requires for his work." It is an attempt to do collectively and authoritatively what Bacon in the Novum Organum and other scientific works sought to do individually. The success of such a movement could not fail to mark a turning-point in scientific research.

Concerning so ambitious a project it is not surprising to find considerable skepticism. Professors Schuster and Pickering of Harvard alone assent in the main to the programme, though Lord Rayleigh in a too brief and perfunctory note gives his blessing. Profs. H. H. Turner of Oxford and G. H. Darwin of Cambridge doubt if the bureau would do much more than furnish positions of eminence to approved scientists. Professor Karl Pearson expresses even more strongly the thought that the trouble with our statistical era is not lack of organization and direction, but lack of brains all along the line. On the whole matter of pseudo-scientific observation, his letter is refreshingly outspoken. We need, he holds, not so much a method of manipulating present statistics, as a means of getting rid of valueless data altogether. "At least 50 per cent. of the observations made and the data collected are worthless, and no man, however able, could deduce any result from them at all. In engineer's language, we need to 'scrap' about 50 per cent. of the products of nineteenth-century science." Dr. Pearson specifies as notoriously inaccurate meteorologic and medical statistics. Biological and sociological observations are ordinarily even of lower value. He doubts whether "even a small proportion of the biometric data being accumulated in Europe and America could by any amount of ingenuity be made to provide valuable results," and believes "that the man capable of making it yield them would be better employed in collecting and reducing his own material."

To assume a position of authority over the incompetents would be immensely difficult, he fears. The director of a bureau for research is too likely to find himself "in an impossible position relative to the mediocre observers whose data he is to manipulate." In short, Professor Pearson ever comes back to his thesis, that it is difficult and always risky to base any generalization on the data collected by routine observers. Inclined as we are to divide scientists into those who measure and accumulate and those who draw general conclusions from the materials thus gathered, Professor Pearson brings us back sharply to the real dilemma, that no man whose nose is always on the details of observation is a safe fact-gatherer, while no one whose head is too high above such necessary drudgery is a safe generalizer. In his scorn of statistics as they are frequently taken, no one conversant with the facts will find Professor Pearson too severe. In these matters one has to do not only with defective intelligence, but with incredible indolence and fraud. Throughout the country the Government pays thousands of persons to take stated weather observations. How many of these hand in sheer guesses? It was an edifying sight in a small New England town to note the elaborate system of corrections by which the observer, an habitual late riser, ascertained the readings he was supposed to take at six o'clock. But his statistics were doubtless as good as many that pass through the Government Printing-Office. Short of fraud, this measuring age produces masses of statistics that prove everything or nothing. After the Presidential election we were offered a chart of appalling size and exemplary neatness, in which was recorded, election by election, the vote of every town in the State for a matter of fifty years back. In this way one might study the political fluctuations of New York or of Cobleskill. It is such methods that make Professor Pearson wonder if the fault is not more with bad observers than with tardy theorists, and lead him to offer, in place of Professor Newcomb's more ambitious scheme, a modest plan for a Statistical and Computing Institute.

This frank confession of a scientist brings a certain comfort to philologers and historians who, imagining modestly that their own subjects had a monopoly in misuse of the statistical method, looked upon the data of the exact sciences with something like superstitious awe. In view, however, of Professor Pearson's avowals, it is evident that a strong human bond exists between him who measures average sentence-length, color words, and the like, and him who tabulates, say, immigration under categories of race and redheadedness. The difficulty is, after all, that which Sir Joshua's pupil found with his palette. Statistics as well as colors need to be mixed with brains; and all the organization in the world brings us little nearer that desideratum. Professor Newcomb's circular note has provoked a very interesting discussion; it may result in the establishment of some new and measurably valuable facility for science. A substitute for the great scientist it will scarcely supply, and the great scientist when he comes will be rather little beholden to organized encouragement. Unhappily, Professor Pearson's idea of an institute for the discouragement of unintelligent research seems even more of a dream than Professor Newcomb's clearing-house and directorate for experimental science.

THE IMPRESSIONISTS IN LONDON.

LONDON, January 16, 1905.

The world does, indeed, move. A few years ago, London would have been the last place chosen for probably the most representative exhibition ever given of the French painters who are grouped together, for convenience, as the Impressionists—a few years ago, the very name of Impressionism being as a red rag in the face of an Academy-bound public. And yet, to

London, to the Grafton Gallery, M. Durand-Ruel is now able to bring a collection of their work so large that his gallery in Paris would not hold it; so fine that never before, within my knowledge, has there been such a chance to study one of the most interesting and defiant phases in the art of the last century. Many of the pictures, of course, have been seen at different times at M. Durand-Ruel's and in other galleries, but never all at the same time; and if several of the most remarkable examples shown at the Paris Exhibition in 1900 are not here, on the other hand, there are several as remarkable from M. Durand-Ruel's own private house that have rarely, if ever, left it before. The result is that, though one may not have anything very new to learn about these men and the movement they instituted, one is able to judge better than ever the value of their influence on modern art, and the reason, perhaps, why it has not been as great as, at one time, seemed likely.

The collection, wisely, has been limited to nine painters. More is to be learned from those who may be called the leaders or inaugurators, than from all the followers, imitators, and hangers-on, who, in trying to carry further a movement they did not originate, usually end by reducing its principles to the last absurdity. The nine are Boudin, who may not seem at first altogether in touch with the others, but whose seas and groups of fisherwomen along the shore, if carefully studied, explain why he has a place with a school devoted to problems of atmosphere; Manet, Degas, and Monet, the three dominant figures (though that Degas should have come to be classified and pigeonholed with Manet and Monet is one of the most curious features in the whole episode); Madame Morisot, whose debt to Manet is great, but who added to what she got from him a very personal note and charm of her own; Renoir, Cézanne, Pissarro, and Sisley, who, it must be confessed, are left by closer acquaintanceship in the secondary rank, where one was from the first inclined to place them. Little by little, the public—even the British public, thanks to the International—has got used to seeing their work, and is therefore no longer scandalized, much as it may still disapprove. The old days of storm and stress, when to their admirers they formed "l'Avant-Garde" of M. Duret's memorable phrase, when, like Zola's hero, they set out to "conquer" Paris, when the discussion of *la peinture claire, plein-airisme,* broken brushwork, the division of tones, led to deadly feuds in the studios and ribald mirth among the critics—those old days have long since gone. To-day, it is only when we remember what painting was in the sixties and seventies that we can understand why Impressionism—a term convenient to use for the meaning time has given to it—was considered such an unparalleled revolt. A revolt, however, it really was, and one that struck deeper at the root of things than the many that preceded it. The Romanticists were rebels to their generation, and yet they rebelled only against the academic; they had no quarrel with the great conventions of art sanctified by the great past. But the most defiant Impressionists, in their eagerness to see Nature for themselves, to avoid known types, to express their own *personality*—in their determination never to compose a picture, never to arrange Nature—rebelled against everything that had gone before, in theory at least. They disdained whatever smacked of the Louvre, though one can now trace in their work enough of the Louvre to have driven them to despair had they discovered it in the first heat of rebellion. To see Nature for themselves meant inevitably to record it for themselves in their own way, and the methods they evolved in the attempt to put upon canvas effects no one had before attempted, bewildered the critics, who could not look below the method, and the then startling results, to underlying principles. That was why Impressionism was denounced as a short cut, a labor-saving device for the artist who was too indolent or conceited to go through the usual training and apprenticeship as student. That such a reproach should have been made against it seems incredible, now that the excitement has calmed down. In an exhibition like the present, nothing strikes one so much as the fact that knowledge, experience, and technical skill are the solid foundation for the most daring experiments of the men who wanted to use their eyes for themselves, and to say what they had to say in their own fashion.

It is amusing to remember the howl of execration Degas raised in London, not more than ten or twelve years since, when the daily press was filled with the immorality of his pictures, and Academicians joined in the attack to expose the unscrupulousness with which he shirked his work. There are thirty-five examples of Degas now at the Grafton; the ballet-girls, the washerwomen, the women at the bath, he never tires of studying. To look at them is to feel how little the question of morality enters into his scheme of art; how these subjects attract him simply because of certain truths he finds nowhere else as strikingly presented; how, so far from evading anything, he seeks in every figure, every arrangement, a new problem of form, or pose, or movement, or foreshortening, or perspective. It is true that often Degas appears indifferent to all beauty, save the beauty of truth. There is one astounding picture of "Miss Zaza," at the end of her performance in mid-air, letting herself down on the long uncoiled rope; and the rendering of the lithe, muscular form, in the tights that allow of no shirking of drawing or modelling, the foreshortening of the legs, the way the strain on the arms and neck is indicated, are all wonderful in their truth and in the simple statement of it—a statement so destitute of the muscular exaggerations, the heroic proportions, dear to the old masters, that the learning upon which it is based is lost upon the casual observer. But then to Degas nothing else has counted except the figure; a picture was not attempted. As often, however, Degas is absorbed in the beauty of his subjects—the beauty of composition as the dancers group themselves for practice or the performance, the beauty of the play of light on their shimmering skirts, the beauty of atmospheric effect as they come and go, now in the flare of the footlights, now in the shadowy distance. There are two large pastels in the collection, unlike any I have hitherto seen, half-length groups of ballet-girls, without background or accessories of any kind, arrangements of their heads and necks and arms as they meet in some pose or movement of the dance; but groups as full of dignity and grace of form, as harmonious in color, as the figures decorating the walls of many an old Italian palace or church. The titles of the paintings and pastels by Degas are seldom a very definite clue—"Ballet-Girls," "Ballet-Girls in Pink," "Ballet-Girls in Green," "The Ballet": how many of his pictures and drawings would not these describe? That is why I can do no more than refer to the series as a whole. One comes from it more than ever impressed with the great accomplishment, the great seriousness of Degas, more amazed than ever that his ballet-girls should have been accepted as a symbol of decadence, his own unconventional conventions as the makeshift of the indolent or the untrained.

The seriousness of the indefatigable student, of the accomplished craftsman, is what impresses one most also in Manet—what, I fancy, M. Durand-Ruel meant should impress the British public. For the Manets sent are mostly those in which even the British public could not see, or pretend to see, indolence and incompetence. There are no pictures like that amusing "Déjeûner sur l'herbe," like the marvellous still-lifes exhibited in Paris in 1900, like some of the later open-air impressions, that I should have liked to find in such a collection. But, after all, the work included, forming a fairly large series, is perhaps the most appropriate to the present exhibition. It shows the stages by which Manet reached his latest and most personal manner. There is a surprising little "Garden of the Tuileries in 1860," crowded with people in the absurd costume of the day, all the infinite detail worked out with a minuteness that would have put Frith and his "Derby Day" to shame, and with a skill altogether beyond the grasp or comprehension of Frith. Then come pictures like the large full-length "Beggar," the huge group of "Wandering Musicians," reminiscent of Velasquez and the inspired days which Manet, not yet quite emancipated from the schools, must have spent in the Prado; pictures like "The Bull Fight" and "Spanish Dancers," memories of Goya in the color, the movement, the spirit. And as characteristic of Manet in his development are the portraits of Mlle. Eva Gonzales which horrified the world at the Salon of 1870, and of "Petruiset the Lion Killer," with its touch of humor that might have been the germ from which Tartarin was evolved, though I am not sure enough of my dates to say whether it was not Tartarin who colored Manet's impression of the lion-killer posing, apparently, in a suburban garden. The study of fish is not one of his most amazing still-lifes; it cannot compare to that triumphant cabbage upon which he lavished as much beauty of handling as painters of old would have devoted to saints and Madonnas; but still so fine is it that, with the others, as well as studies of Manet's own garden, commonplace save for the magic of his brush, and a sketch, all action, of races at Longchamps, it will give people who have only seen occasional Manets here and there, a fair idea of why artists look up to him as one of the greatest and most original of modern painters.

Monet is better represented, though, unfortunately, not by any of the earlier works done before light and atmosphere were to him all engrossing—not by anything like that unforgettable French interior at the

breakfast hour, in which every fact of the breakfast table, from the napkins in their rings to the grapes for dessert, every fact in the family group from the baby in its chair to the *bonne* in her cap, is set down on the canvas with the painstaking fidelity, the uncompromising accuracy, of a description in words by Zola; a "human document," if ever there was one. There are, however, paintings of a fairly (if not quite) early period, before which the critic who has been pleased to think Monet cannot draw, must find himself silenced forever. One of these is a study of "Pheasants," from M. Durand-Ruel's dining-room, the birds drawn with a skill I thought no modern, except Manet, had ever attained; the plumage, the color, the play of light on the feathers, the white tumbled cloth over the table where they lie—all these things rendered as only a master could render them, and all kept in such perfect tone that out of such very simple materials a pictorial whole, splendid in its beauty, has been created. Really, I have never seen anything of Monet's I thought so masterly. After this, it is easy to follow him from the canvases, like the Gare St.-Lazare, with its effect of sun and smoke, and the Vétheuil and Argenteuil, in which he still seems conscious of the beauty of line, the importance of design, down to examples of the famous haystack and Rouen Cathedral series, in which he disdains everything save the passing effect. I admit he gets this effect in a very astonishing manner. But I cannot help feeling again at the Grafton Gallery as I felt at the Paris Exposition in 1900, that something had been lost, something sacrificed, by his indifference to everything but the momentary phases, the ephemeral changes of atmosphere and light. If nature, to which the painter has made his vows, is at the trouble to arrange a picture for him, well and good; if not, it makes no difference. He is satisfied with nature, whatever may be the mood or the aspect. And yet art would not be art were it not above and beyond nature.

This haphazard selection of motives—or, rather, this absolute non-selection—leads to more unfortunate results in the lesser men of the group. Not one of them (to me, anyway) illustrates so well the snares and pitfalls of what has come to be called impressionism, as Renoir. Every distinction has been shown to him here. Almost sixty of his studies and pictures have been hung, and well hung. Some are as well-known as the often-reproduced picture of a man and woman in a box at the theatre; others, probably, have never been publicly exhibited before. But a smaller series would have done him more honor. For, while one comes upon exquisite passages—the painting of the nude in sunlight, a child's face in profile, a cat on a woman's lap, flowers, or fruit—one comes as often upon passages discouragingly vulgar, Nature having her vulgar moods, which it should be the business of the artist to correct, which he does correct when he is not as confused and blinded by his theories, as completely a slave to them, as Renoir. I think the same is true of Sisley and Pissarro, though less obvious in the case of Pissarro, who found his most sympathetic subjects in the streets of Paris, a city which seldom fails to offer a composition, made to the painter's hand. Cézanne's pictures are few, and, with the exception of his still-lifes, do not prepare one to accept him altogether as unreservedly as the most devoted of his following. As for Madame Morisot, as now seen, she calls for little reserve in one's tribute to her. She places a model before the mirror at a not very interesting moment of the toilet, or a sitter doing nothing at all in a garden, and her color is so delicate, her values so right, that one sees only the tender harmony of grays or pale golds. And if her little marines point without mistake to their origin in Manet, they are the work of an intelligent pupil. Few other women who have ventured to practise an art for which their sex seems to disqualify them, can approach her. N. N.

Correspondence.

THE EXCHANGE OF PROFESSORS BETWEEN AMERICA AND GERMANY.

To the Editor of The Nation:

Sir: The widespread interest aroused by the German Emperor's plan to bring about a systematic exchange of professors between German and American universities makes it seem desirable to point out the intimate connection which exists between this project and the beginnings of the Germanic Museum of Harvard University.

In March, 1901, as a result of the Emperor's magnanimous initiative in donating to the Museum a superb collection of casts of monumental German sculptures, there was held in the Royal Museum of Arts and Crafts at Berlin a meeting to consider ways and means of furthering the propaganda for the Germanic Museum throughout Germany. (One result of these deliberations, it may be said in parenthesis, has been the splendid collection of reproductions of ancient German gold and silverware which, as a gift of the German people, now constitutes one of the finest treasures of our Museum, having formed during the last year a conspicuous part of the German industrial exhibit at St. Louis.) The meeting was attended by Dr. Althoff, commissioner-general of the Prussian universities; Dr. Schöne, director-general of the Prussian museums; Dr. Lessing, director of the Museum of Arts and Crafts; Professors Harnack, Paulsen, Brandl, Erich Schmidt, Wölfflin of Berlin University; Ernst von Wildenbruch, the author; Rudolf Siemering, the sculptor; Arthur Gwinner, director of the Deutsche Bank, and other men eminent in Berlin public life, together with a representative of Harvard University. The scope and the aims of our proposed museum were set forth before this assembly, the fact was emphasized that it was designed not only as a storehouse of typical productions of the Germanic past, but also, in accordance with the well-known intentions of the Emperor, as a connecting link between modern Germany and modern America; and the hope was expressed that it would ultimately develop into an institution to which German professors might be called to lecture to Harvard students on German history, literature, art, and thought. This meeting was followed, during the next few weeks, by repeated conferences with Dr. Althoff, in the course of which this able, progressive, and far-sighted administrator evinced the greatest readiness to enter into arrangements which would make the carrying out of these international plans possible. The upshot of these conferences was the draft of a provisional agreement between the Prussian Government and Harvard University, according to which, for a period of five successive years, an exchange of professors between Harvard and Berlin University was to be instituted, in such a manner that every year one member of each of the two institutions would enter for at least three months the regular teaching staff of the other institution; it being understood that in each case the visiting member represent subjects or methods distinctly peculiar to his country. This scheme, which met with the hearty support of President Eliot, was discussed and approved a year later by the Harvard faculty, and reached its consummation a few months ago when, through the intercession of Professor Harnack, an official proposition embodying it was made by the Prussian Government and adopted by the same.

It is most fortunate that the German Emperor, with his quick grasp of international relations and his deep sympathy for the American people, has now given to this whole subject a much wider scope by proposing to extend the exchange of professors to other universities in America and Germany; for it seems as though such a measure could not fail to open the way toward a veritable fraternization of the moral, intellectual, and industrial leaders of both nations.

Is not this the time for Americans to bestow renewed interest and effective support upon that American institution of learning which was the first to attract the friendly attention both of the German Emperor and the German people, and which was chiefly instrumental in furthering the plan of an international exchange of scholars that now has come to be a fact? The splendid gifts of the German Emperor and the German people to the Germanic Museum of Harvard University are still housed in a manner entirely unbecoming their intrinsic beauty and their historical significance. May we not hope that, before the first representative of Berlin University arrives to take up his duties as professor at Harvard University, there will have been brought together sufficient means to give a worthy background to the noble representatives of the German past now so inadequately sheltered? Kuno Francke.

Cambridge, February 2, 1905.

AN OLD JOE.

To the Editor of The Nation:

Sir: The following squib on the notorious relation between Pope and (William) Broome in the translation of the Odyssey,—

"Pope came off clean with Homer; but they say
Broome went before and kindly swept the way,"—

is, in the Dictionary of National Biography, *sub* Broome, vi. 442*a*, attributed to Henley. Yet the pun on broom and sweeping antedates by many years Pope's birth. In classifying the contents of the (Old) Shakspere Society volumes I have just come across a paper by Halliwell, in volume iii. of the Society's Papers, 1847, pp. 172-174. Halliwell is quoting from "a very scarce little volume, entitled 'Choyce Drollery, &c.'," London, 1656. Evidently the 'Choyce Droll-

ery' is a fire of squibs upon the poets of the early seventeenth century, and must have existed long before its publication. At page 173 we may read:

"Of these sad poets, this way ran the stream,
And Decker followed after in a dream;
Rounce, Robble, Hobble, he that writ so high big,
Basse for a ballad, John Shank for a jig;
Sent by Ben Johnson, as some authors say,
Broom went before, and kindly swept the way:
Old Chaucer welcomes them unto the green,
And Spencer brings them to the Fairy Queen."

The italics are mine; the spellings Johnson and Spencer are part and parcel of the Drollery. It seems, then, that the collaboration of Ben Jonson and Richard Brome was duly "embalmed" a century, perhaps, before Pope's Odyssey. What a pity that Pope should have been unaware of the existence of the Drollery!

J. M. HART.

CORNELL UNIVERSITY, January 26, 1905.

THE FIRST EDITION OF 'PILGRIM'S PROGRESS.'

TO THE EDITOR OF THE NATION:

SIR: Adding to the information given by your correspondent, Mr. Victor H. Paltsits, on the first edition of Bunyan's 'Pilgrim's Progress,' I wish to say that six copies in all are known to exist. Of these I believe only two are perfect, and one of them is in the British Museum. The trustees of the famous English institution bought their copy at a bargain price, since the only perfect copy ever offered at auction realized £1,475.

Imperfect copies are generally deficient in the title-page. It may interest your readers to reproduce the photographed "process reproduction" I enclose, obtained from a London bookseller's catalogue.

Yours faithfully, TEMPLE SCOTT.

NEW YORK, FEBRUARY 4, 1905.

Notes.

The Baker & Taylor Co. announce 'Power and Health through Progressive Exercises,' by George Elliott Flint.

'The Wives of Henry VIII.' is the title of a new work, by Martin Hume, to be published by McClure, Phillips & Co.

L. C. Page & Co., Boston, will soon issue 'The Fair Land Tyrol,' by W. D. MacCrackan.

'The Elements of Railway Economics,' by W. M. Acworth, is set down for speedy publication by the Oxford University Press (H. Frowde).

In commenting upon the recent sumptuous American edition of Mackail's translation of Virgil's Georgics, we overlooked the fact that a very neat edition of the same translation had been put upon the American market five years before, by Thomas B. Mosher, Portland. This is in two dainty volumes, each with a finely executed photogravure frontispiece and appropriately decorated margins, and is printed on handmade Van Gelder paper. Any genuine lover of the poem and its author would delight to have it on his table or in his pocket, and the price is so low that no one need deny himself that pleasure. There is a prefatory note transferred from Mackail's 'Latin Literature,' and Dryden's summaries stand at the head of the several divisions of the poem.

By a notable coincidence, Ginn & Co., Boston, have issued 'Selected Poems of Elizabeth Barrett Browning,' edited by Elizabeth Lee, while the Clarendon Press (H. Frowde) at the same time issues a 16mo edition of Mrs. Browning's complete works, and, in the "Oxford Miniature Edition," 'Casa Guidi Windows, and Other Poems [not included in a preceding complementary volume, "Aurora Leigh, and Other Poems"].' Both these English editions are on the famous thin paper by resort to which, while still using a clear type, the Press contrives to disguise the bulkiness of the poetic output. The 'Casa Guidi' has for frontispiece a copy of the portrait by Gordigiani, and this is much the least distressing and most attractive of any of Mrs. Browning known to us. The "Oxford Complete Edition" gives the cadaverous face drawn by Talfourd, and this is made worse by copying in the Ginn edition. Miss Lee's introduction ends with a chronological table of Mrs. Browning's life and works, set over against the events and the literature of her time. "In her sonnets all is perfection," writes Miss Lee; but we think she had better have omitted that ominously entitled "Insufficiency," as not helpful to her contention in any particular that makes for greatness in a sonnet.

A companion edition to the larger Oxford mentioned above is 'Poems of Tennyson'; not all, but including 'The Princess,' 'In Memoriam,' 'Maude,' 'Idylls of the King,' and many shorter pieces, filling 632 pages and yet not exceeding in thickness 200 on ordinary paper, and the letterpress generous to the eyes.

Very timely is the Clarendon Press extract from Thiers's 'Histoire du Consulat et de l'Empire' (Vol. XIV.), 'The Moscow Expedition,' edited by Hereford B. George. This scholar repairs a fundamental defect in Thiers's great work, the withholding of "references whereby his accuracy may be tested," by supplying (at the end) notes explicatory and critical. The campaign is presented in the middle, *i. e.*, with the battle of Borodino, and we can counsel any one with a knowledge of French to compare this narrative carefully with Tolstoy's picture in 'War and Peace.' The accompanying maps will serve for either work. On these alone, Mr. George reminds us, the translation of Russian proper names will be found consistent. He supplies further an index of persons and a geographical index. The aim of this reprint is as much literary as historical.

The sister University Press of Cambridge (New York: Macmillan) adds to its "Cambridge English Classics" the 'English Works of Roger Ascham,' edited by William Aldis Wright. These embrace "Toxophilus," "Report of the Affaires and State of Germany," and "The Scholemaster," all posthumous except the first (1545). Mr. Wright's task has been to ensure the purity of the text. At the close he groups together the errata designated in the original copies, so far as they are misleading, having mended them in their respective places. Printers' errors have been rectified without recording them. The curious and readable part of this collection is in the teaching of bow shooting; the immortal part lies in the chapters on education.

Prof. Herman Harrell Horne's 'Philosophy of Education' (Macmillan Co.) is said to be an application of "idealistic theism," which in this case seems to mean a Hegelian idealism. But nobody need be deterred from reading the book because high philosophy is distasteful to him, for there is little more than a slight flavor of it. Its chapters, except an introductory one on the Field of Education, are respectively entitled: The Biological, the Physiological, the Sociological, the Psychological, and the Philosophical Aspect of Education, the last filling one-ninth of its pages only. One perceives that the book was originally a course of lectures that were easily listened to, and from which one would carry away many interesting scraps. In short, it is pleasant reading, and far from heavy. It has an agreeable dress, and is furnished with a good index, much wanted in a volume of which so many paragraphs will be recalled. It is not a work to excite any violent protest or objection. The author's admirations are many and warm, and the preface couples President Eliot and Socrates.

'The Lands of Rhode Island as they were known to Caunounicus and Miantunnomu' is the title of a book of about 300 pages, written and published by Sidney S. Rider of Providence. The volume begins with a chapter upon the characteristics of the Narragansetts, drawn chiefly from Roger Williams's 'Key.' This is followed by a study of the acquisition of the Indian lands, with their subsequent division into towns and counties, and a discussion of the alleged forgery of the original Providence deed. The latter is in reaffirmation of Mr. Rider's forgery claim advanced in his "Historical Tracts," second series, No. 4, in 1896, and answered in the same year by Mr. George T. Paine. The larger and more valuable portion of the volume is taken up with a series of historical notes upon early Indian localities in Rhode Island, accompanied by a map. Many of the longer notes are reprinted from previous articles in Mr. Rider's *Book Notes;* and those upon the Island of Narragansett, the Hill of Notaquonckanet, Queen's Fort, and the Island of Quetenis, are especially excellent. The references to printed sources seem in the main to be correct. On page 253 Mr. Rider curiously misreads the meaning of the old English word "against," or "opposite," and hence falls into confusion in locating Solitary Hill. Although the book is a contribution to local history, it is unfortunate that the author could not have made more research into manuscript sources. It seems odd, moreover, in these days of scholarly book-making, that the notes upon localities were not arranged in alphabetical order, and that the volume was not provided with an index.

The record of the Fifty-fifth Ohio Volunteer Infantry, entitled 'Trials and Triumphs' (Chicago: A. C. McClurg & Co.), has many meritorious features. Inasmuch as the regiment was formed in Huron County, a portion of the Western Reserve, the reproduction of eighty or more portraits of members of the command, with a truly democratic inclusiveness of non-commissioned officers and privates by the side of the field and company officers, will afford the future student of the constitution of our American population of the war period some interesting specimens of typical faces, mostly of the Saxon stock—provided (and this is an

important contingency) the paper of the present day lasts sufficiently long to be available for the ethnologist. The reproducing process, indeed, gives the faces a somewhat wooden look, a result helped by the primitive photography of forty years ago; yet these are a sturdy, intelligent company, excellently illustrative of the main stuff of the Union armies. There are several maps, slight but sufficient; and the different chapters, each contributed by some member of the editorial committee of which Capt. Hartwell Osborn is the chairman, have the advantage which earlier regimental histories sometimes lacked, of fitting the operations of this body into the larger record of the war as settled by accredited histories. There is a full roster of the regiment, and a complete itinerary of the wide activities of its service. Organized in October, 1861, under officers apparently without even militia experience, it had opportunities to learn the art of war in the school of hardship, and seems to have creditably acquired its lesson. From its first duties in West Virginia, it was transferred to Pope's army in the unfortunate campaign between the Potomac and the Rapidan in the summer of 1862. It was with the Eleventh Corps in the disaster of that organization at Chancellorsville; and at Gettysburg it was posted at the salient of Cemetery Hill, near whose foot its monument has been placed. It went with Hooker to Tennessee with the troops from the Army of the Potomac who, later, constituted the Twentieth Army Corps under Sherman. It bore a part in the capture of Atlanta and in the march through Georgia and the Carolinas. Thus its record presents a good picture of the most stirring events of the war, East and West.

The *Library Journal* for January announces a lowering of its price in connection with its abandonment of its *Literary News* book supplement. Mr. Fletcher's *Library Index*, a monthly publication on the lines of Poole, also dates from the first of the year.

The *Cumulative Book Review Digest*, monthly, is projected for issue directly by the H. W. Wilson Co., of Minneapolis, publishers of the *Cumulative Book Index* and the *Readers' Guide to Periodical Literature*. Its purpose is "to furnish librarians and bookdealers with an up-to-date and reliable means of securing the evaluation of books as they are published."

The annual list of the important additions to the Boston Public Library during the past year is substantially the same in size and make-up as those of previous years. The titles are entered under twenty-three main heads, with numerous subdivisions. In view of this fact, an alphabetical index of authors and subjects would be of great assistance. Some books are hard to find through ignorance of the heading under which to look for them. Beveridge's 'Russian Advance,' for instance, is not to be found under "Russia," but under "Asia, The Orient: Eastern Question."

The intimate connection of intelligent missionary work with the material development of a half-civilized people is shown in a recent report of our consul at Harput, Mr. T. H. Norton. He says of the American missionaries in his district that, "in a thousand ways, they are raising the standards of morality, of intelligence, of education, of material well-being, and of industrial enterprise. Directly or indirectly, every phase of their work is rapidly paving the way for American commerce." The "almost incalculable" influence of the twelve doctors leads him to ask "if there are not equally capable young American business men, animated with the same ideals as these physicians, ready to enter upon a commercial life in the Orient? The influence of an upright, straightforward, energetic American merchant would count for almost as much, in the way of moral leaven, in the business circles of an Oriental city or province as would that of a physician in its family life."

The literary and academic world of Germany proposes to celebrate the centennial of Schiller's death, on the 9th of May of the current year, on a grand scale. The Schwäbischer Schiller-Verein of Stuttgart will popularize his works in an unprecedented manner, by publishing an edition of his Poems and Dramas at the nominal price of one mark. This edition, running into the tens of thousands, will not come into the book trade, but will be sold only from the headquarters of the Verein. Schiller having been born in Würtemberg, the celebration of his centennial is regarded in Stuttgart as a patriotic duty. A number of universities have already announced special celebrations on the above date, especially Strassburg and Tübingen. No doubt the leading celebration will be held in Jena, where Schiller was for years professor of history.

—Henry Loomis Nelson opens the February *Harper's* with a sketch of the heroic struggles and recurring disappointments of La Salle until the bullets of ambushed assassins ended his unfinished career. In addition to two colored plates by Pyle, Moll's interesting map of the Great Lake region, 1720, is reproduced, together with a copperplate portrait of La Salle by Van der Guch, 1698, and a print from Hennepin's "Découverte," representing the building of the *Griffon*. John Burroughs returns once more to his battle against the untrained nature romancers who imagine themselves a new school of naturalists, but befogs the issue, and comes perilously near losing his bearings in a theoretical attempt to prove that animals do not "think." Professor Rutherford of McGill University considers radium as the possible source of the earth's heat, both directly and from the sun, with the encouraging conclusion that Lord Kelvin's estimate of five or six million years for the duration of the effective energy of the sun may be multiplied by one hundred. One is reminded of Cato's words in the 'De Senectute' as to the retention of conscious existence beyond the grave: "Yet if I am mistaken in this . . . I have no fear that dead philosophers will laugh at my mistake." W. S. Harwood keeps nearer to the earth and the present day in presenting some results of recent marine biological researches, those explorations *in minimis* that must occupy the La Salles of to-day, now that the "raw material" for the older style of adventure is so nearly exhausted. The Easy Chair has its say on the marriage question, taking the very conservative ground that, with all its faults—or, rather, the faults of those who marry—there is really no thinkable substitute for the institution substantially as we have it, and that marriage and more of it is the inevitable outcome of every assault upon it. Therefore, the one practical problem is, how to make it tolerable in cases where it cannot be positively happy.

—The second of Mr. Vanderlip's papers in *Scribner's*, on European political problems, deals with the recent growth of Socialism. Everywhere, he thinks, the present tendency of the Socialist movement is to recoil from the extremes of its most radical element, and throw its strength into demands which it may reasonably hope to see granted without waiting for the acceptance of its entire programme. Thus the chances are, in his opinion, that much of real good will be secured, with no great danger of violent revolution. John Corbin writes in a somewhat discouraged strain of theatrical conditions in New York. His suggestion for improvement is the old one of a subsidized theatre, free from the influences which corrupt existing institutions. Full confidence is expressed in the existence of a constituency which would support a theatrical institution of real worth, if only that constituency could be effectively organized. Just what the nature of the organization should be, in order to maintain the standard desired, we are not told. One could hardly feel assured that a theatre under municipal control would be held to the proper level.

—Edward Stanwood opens the *Atlantic* with a paper on the present predicament of the Democratic party. The two parties, he holds, have essentially reversed their positions since 1860, the Republicans having become conservative and the Democrats radical; the latter party, however, containing so large a conservative element as to thwart any effective party action. The discussion is marred by Mr. Stanwood's failure to use the terms conservative and radical with reference to any fixed standard. Any attempt to apply such a standard would have made it impossible to characterize as essentially conservative the party responsible for the many aberrations from traditional policy which have grown out of the Spanish war, and the various expedients by which apparent constitutional checks to these aberrations have been avoided. As a matter of fact, the chaos which Mr. Stanwood rightly detects in a party that contains a Bryan and a Cleveland, is not essentially so very different from that which is potentially present in a party embracing at once an Aldrich and a Roosevelt. James Schouler contributes a paper on the Jackson and Van Buren manuscripts which have recently been acquired by the Library of Congress. In the Van Buren collection, though smaller in bulk, he finds much more material of permanent value. The general tendency of it is to support the more favorable view of Mr. Van Buren's character and ability which one finds first adequately expressed in Mr. E. M. Shepard's admirable biography. From Dr. William Everett we have a study of six different dramatic presentations of the story of Cleopatra, beginning with Shakspere and ending with Madame Émile de Girardin.

—The letter P, in the instalment "Parge-ter-Pennached" of the Oxford English Dictionary (Henry Frowde), maintains its promise as most outlandish. "Of the 2,477 main words, only *two* have any claim to be considered native in Old English, viz.,

Parrock and *Path*." This fits well with such extraordinary diversity of spellings as is shown in the case of Parsley, Parsnip, and Partridge. The orthography of Parsimony is not quite fixed—as, in France, the French Academy exchanged the classical *s* which it had sanctioned in 1798 for *c* in 1835. By Johnson's time, Partage, which had been early naturalized, took out French papers again, and its *g* is now pronounced in the French fashion, with corresponding stress on the last syllable. So Parvenu is set down as French, still; but, as we have Parvenudom, why should not the derivative anglicize the root-word? Analogically, Quixotic is our justification for abandoning the Spanish pronunciation of Quixote. We should have been glad to find Parlement in its alphabetical place, either as a French or as an English word. In the remarkable historical article on Parliament the French form is considered in connection with foreign usage, and there is a quotation from Morley's 'Critical Miscellanies': "The parlement took up their judicial arms," etc., which would have warranted the entrance of this vocable in the Dictionary —all the more because it saves the English mind from confusing two distinct bodies. The quotations in support of the sense equivalent to Italian *parlamento* are confined to Florence; but this "meeting of all the men of a state capable of bearing arms," this "solemn Parliament held in the Piazza," was of course known elsewhere: see Carducci's rugged stanzas, "Il Parlamento," that, namely, before the battle of Legnano in 1176:

"I milanesi tenner parlamento
Al sol di maggio.
. . . . . .
" 'A lancia e spada,' tona il parlamento,
'A lancia e spada, il Barbarossa, in campo.' "

—Ever and anon Dr. Murray has to criticise Continental lexicography in view of English experience of the history of words borrowed more or less immediately from across the Channel. He does so now in the instance of Patchouli, which Hatzfeld-Darmesteter suggests may be a phonetic disfigurement of the English Patch-leaf; but the word occurs (by way of the East) in English literature as early as 1851, while Littré pronounced it for France a neologism in 1875. Littré also stamps *passe-garde* as a neologism of the nineteenth century, so that though it agrees in form with our spelling of Pass-guard, it may not be regarded as begetting our English word of the sixteenth. French idiom must needs understand by this compound 'that which is used to pass a guard'; the English compound naturally signifies 'the guard of a pass.' The verb Partake is a "back-formation" from Partaker (part-taker). "As a direct formation, a verb *part-take* would have been against English idiom"—whereas our German cousins make no bones of *teilnehmen* (any more than we do of *participate*). There is a considerable list of Americanisms, such as Parietal (in the Harvard sense), Parish (the church body or congregation, and a county), Park (in the Yellowstone and Colorado senses), Parking (the treatment of avenues with green strips in the middle), Parterre (the floor under the theatre gallery), Pass (as, a dividend); together with some pronunciations. Perhaps we might have looked for the insertion of Parrott, a gun much in evidence during our civil-war period. We can do no more than refer to the interesting discussions under Pasha (bashaw), Pasquin and Pasquinade, and to the great rubric Pass. We will end by remarking that while this Dictionary is the product of thousands of readers noting the date of appearance and shades of meaning of English words and phrases, it is itself a quarry inexhaustible for subsidiary illustrations. Emerson, for example, is quoted for the sake of Parliamentary, and on that we fix our main gaze; but a side-glance shows in the same connection our common friend "the man in the street" (1854), now passing his half-century. Who can be sure that this phrase will not fall between "Man" and "Street" in the Dictionary and be lost to the investigator of its origin and antiquity, or be cited with a much posterior date?

—The new edition of Sir George Webb Dasent's 'Popular Tales from the Norse' (G. P. Putnam's Sons) is the third edition of a book published for the first time as far back as 1859. Years, however, count for nothing in tales of the character of those which the volume contains, and these in particular, because of their manner and matter, are as fresh as on the day when they were first given in English garb. The book contains, besides the "Tales," the Introduction of the original edition, which considers broadly the origin and diffusion of folk-tales in general, and of the Norse popular tales in particular. The "Introduction" is one of the notable contributions which the author made to the English literature on Northern subjects. Like the introduction to his own translation of the Njal's Saga, and the memorable essay on the "Norsemen in Iceland," contained in the 'Oxford Essays for 1858,' it not only is characterized, as, in fact, all of Dasent's writing in this field is, by a scholarship rarely sympathetic in its insight, but also, like the rest, it is a superb piece of English prose. Some of its opinions, in the light of more recent knowledge, doubtless need restating, but fifty years have by no means superseded it, and in the main it might well have been written to-day. A new part of the book is a memoir of the author by his son, Arthur Irwin Dasent, who gives an account of his father's career from the time of his birth, on the island of St. Vincent, in 1817, to his death in England, in 1896. It is the story of an extraordinarily full and busy life, and a typically English record, at the same time, of recognition and merited reward. Dasent began his life in England as a lad in Westminster School, passing thence to King's College, London, and then to Magdalen College, Oxford. Subsequently, he was secretary of legation in Stockholm, where he acquired that intimate knowledge of Scandinavia and developed that love of its literature with which his name is lastingly connected. For twenty-five years he was associate editor of the London *Times*; he became, in 1852, an advocate in Doctors' Commons; the year after, he was appointed professor of English literature and modern history at King's College; the later years of his life were spent as the official head of the Civil Service Commission. On the recommendation of Disraeli, he was knighted, in 1876, "for public services." 'Tales from the Norse,' it is not an exaggeration to say, has become an English classic. Dasent was a rare translator. In point of fact, it is difficult to realize, from the present form of these stories, that they have been translated at all from a foreign medium. Their popular environment has left but little trace of the immediate soil that produced them, which is inherently the same in England and in Norway, and the underlying beliefs and natural habits of thought are essentially the same. There is, however, in these translations more than a mere transference of form, to which the material readily lent itself because of its content. Scarcely a writer of recent time has been the possessor of such an English vocabulary or the master of such an English style. Dasent's 'Tales' are in this way not only a singularly remarkable instance of felicitous translation from a foreign language into our own, but are at the same time a well of English, pure and undefiled, and a model of what English prose happily may be.

—Prof. J. H. Robinson is supplementing his 'Introduction to the History of Western Europe' by a source-book entitled 'Readings in European History' (Ginn). Of the two volumes to be comprised in this work, the first has already been published, and in it will be found extracts illustrating the progress of culture from the decline of the Roman Empire to the age of Luther. As here arranged, the selections to illustrate particular points follow the subjects dealt with by Professor Robinson in the text-book already mentioned; that is to say, corresponding to each chapter of text, there is a section of sources. This feature of the editing should not, however, prove a stumbling-block to those who use the 'Readings' independently of the 'Introduction.' The subjects dealt with are so large that they must inevitably fall within the limits of any general survey. Professor Robinson served his apprenticeship as an editor in helping to issue that excellent series of "Translations and Reprints" which has for several years past been published at intervals by the University of Pennsylvania. The dedication of the present book to Professors Cheyney and Munro thus recalls a pleasant association which has also proved serviceable to many teachers in all parts of the country. Concerning the selections brought together in the present volume, it may be said that each emphasizes a striking phase of historical development, although at times the passages required for purposes of demonstration make it necessary to exclude some documents which are perhaps more celebrated than those inserted. In our opinion, the most successful feature of the work is its bibliographical apparatus. Appended to every chapter there is a classified bibliography arranged under the three heads of "references," "additional readings in English," and "materials for advanced study." Much care has evidently been taken with the preparation of these lists, and, graded as they are, they have a most practical character. Of the selections themselves, the best are those which relate to mediæval institutions, while the least satisfactory are those that bear on the Renaissance. But, when making this discrimination, we must be careful to give all portions of the book credit for drawing their materials from sources of a high order.

—The December, 1904, number of the Madrid review, *Nuestro Tiempo*, which is under the directorship of Salvador Canals,

and which represents the best of modern Spanish thought, begins the publication of what promises to be an important series of articles on "The Life and Writings of Dr. José Rizal," which should be of especial interest to Americans. They are by W. E. Retana, the well-known Philippine bibliographer and copious writer on the Philippines, who has made an extensive collection of documents written by Rizal and documents regarding that Filipino patriot and martyr, whose influence after death transcends that when living. It is Sr. Retana's intention to let these documents speak of Rizal, rather than to attempt a full and connected life, for which he lacks time. The initial article takes us through the first twenty-one years of Rizal's life until 1882, when he was about to start for Spain. We see him as an earnest, studious youth, precocious beyond his years, at the head of all his classes, already a poet, and soon to manifest the true artist mind. A poetic drama written when Rizal was but thirteen years old, and called "Near the Pasig," is given—a fantastic religious poem that seems beyond the lad's age, and causes one to wonder whether some priestly supervision was not given to it. His poem "To the Filipino Youth," which exhibits great poetic feeling, is also reproduced. Retana tries to prove that the thought of Filipino independence was uppermost in Rizal's mind even when a boy, but this might easily be debated. Careful reference is made to the sources used in the compilation. Two, of especial interest, are the private note-books of Rizal, which are now in the possession of Mr. E. E. Ayer of Chicago.

EDWARD BURNE-JONES.

Memorials of Edward Burne-Jones. By G. B.-J. The Macmillan Co. 1904.

It rarely happens that the record of a great man's life is written by one who has been in full sympathy with him, or who has taken part in it; general opinion, even, is rather against a man's widow being the most competent person to write his biography. There are exceptions, however, to every rule, and we claim the exception for Lady Burne-Jones's two interesting volumes of Burne-Jones Memorials. Sir Edward Burne-Jones considered that biography had little to do for the artist or for the poet—their work should tell of them all that concerns the public. In later years, however, he knew that his life would inevitably have to be written, and he expressed to his wife the wish that she should do it—"*for you know*," he said. Lady Burne-Jones seems especially endowed with the qualities needed for the task; she writes with convincing sincerity and a sense of humor, and has the gift of literary style. She has wisely avoided any artistic appreciation of her husband's work as a painter, but has taken great pains to collect all the facts relating to his family, its origin, his education and early tendencies, his friendships and ideas, often quoting his own words from letters to friends. Her readers cannot fail to get a vivid impression of Burne-Jones's fascinating personality, and to understand what Lowell meant when he said that, even without his pictures, Burne-Jones was one of the most remarkable men of our time.

Edward Coley Burne-Jones was born in 1833 at Birmingham. His mother died a week after his birth, and the grief of her loss made it impossible for some years for the father to take any pleasure in his child. Edward Richard Jones was a carver and gilder by profession; his business was never flourishing, and he worked hard early and late so that his young son should have every advantage. Some friends of his mother's had found a competent person to take charge of the young child and the neglected home—a Miss Sampson, who became a devoted foster-mother to the delicate child, and did all her limitations allowed of for his welfare. The home, 11 Bennett's Hill, being in the city, his father used to send him in the summer with Miss Sampson to stay at farmhouses in the neighboring villages, so that he should have the advantage of country air. His earliest friends were the children of a Jewish family living in the neighboring house; they were his constant playmates, regarding him as one of themselves. He even participated in all their religious festivals; he was dressed up with the other children for the Feast of Purim. In company with these friends he sometimes went to the seaside at Blackpool, near Liverpool. Among Burne-Jones's earliest recollections was the day of the Queen's coronation; he was then four, and was taken to the Town Hall "to see where the poor folk were going to be feasted," amid "a general sound of happiness in the air and the ringing of bells." He was also "allowed to wave a banner in the air in front of the house, and that gave me more happiness, I think, than anything that has happened to me ever since," he writes in 1873 to a friend.

It was a Mr. Caswell who first noted the child's inclination for drawing. He and his wife were friends of his father, and used often to have the boy to stay with them at their home in the country outside Birmingham. Mrs. Caswell's garden, with its fruit-trees and sweet-smelling flowers, were always among his most cherished remembrances. Mr. Caswell lent him engravings to copy. One of these attempts at the age of seven still exists, of a group of deer. Mr. Caswell had written his comment across the sky, a deed which caused the greatest resentment at the time in the child's mind. Lady Burne-Jones writes:

"About this early habit of drawing we have his own words recorded by a friend, an artist, who, talking to him of David Copperfield and his neglected childhood, remarked in passing that he himself never remembered feeling unhappy when he was left alone. 'Ah,' said Edward, 'that was because you could draw. It was the same with me. I was always drawing. Unmothered, with a sad papa, without sister or brother, always alone, I was never unhappy because I was always drawing. And when I think of what made the essence of a picture to me in those days, it's wonderful how little I have stirred. I couldn't draw people, of course, but I never failed to draw mountains at the back of everything, just as I do now, though I had never seen one.' "

It was at the age of eleven that Burne-Jones was sent to King Edward's School, within an easy distance of his father's house. He was placed in the commercial department, where no Greek was taught, only Latin; his father evidently intending to fit him for a business career. He took rather a low place for a boy of eleven, but he was twice promoted during the first six months, and by June, 1847, he was in the first class, where he remained to the end of his term. During the last half-year he was Caput of the English school. By the advice of the headmaster it was decided that Edward Burne-Jones should pass on to the Classical school, and go to Oxford later; but there exists no evidence that his masters saw any special gifts in the lad. His natural destination seemed the Church. He got gradually drawn into the High Church movement on account of the barren ugliness of the evangelical services he had been brought up to follow. He had occasion to stay with friends near Hereford Cathedral, and delighted in its services. There, too, he became intimate with the Rev. John Goss, a minor canon of very advanced High Church proclivities. He it was who advised Edward Burne-Jones to enter his name for Exeter College, Oxford. He had come under the influence of Newman's writings two years previous to this; they had a hold on him all his life, teaching him indifference to luxury and worldly advantages. Writing of Newman, he says: "So he stands to me as a great image or symbol of a man who never stooped, and who put all this world's life in one splendid venture, which he knew, as well as you or I, might fail, but with a glorious scorn of everything that was not his dream."

Difficult as it may seem for a woman to describe college life, our author gives us a very interesting account of those years at Oxford. She has been aided here by the note-books of Burne-Jones's chums, besides his own, which he seems to have kept with sufficient regularity. His letters home also have helped to reconstruct this period. We get to know the knot of friends who remained intimate with him all his life, so faithfully does Lady Burne-Jones seek to give their separate individuality. It is this ungrudging amount of detail that makes the book such good reading. Burne-Jones entered the University full of enthusiasm, expecting to find help and strength to fit him for the clerical career he had in view, but to his utter disappointment he found extreme indifference to religious questions, notwithstanding the crisis the Church had so recently passed through. At Exeter College he found himself among strangers, but immediately made the acquaintance of William Morris. They were drawn together from the first by similarity of religious views, and by their taste for art. Morris too was preparing to enter the Church: they neither of them had anything in common with their fellow-collegians at Exeter, but there was a little colony from Birmingham at Pembroke more congenial in their aims, with whom they spent their evenings. Both Morris and Burne-Jones found the work for the schools uninteresting through the manner of teaching. They walked and read together Carlyle's 'Past and Present' and 'French Revolution,' Hallam, and Ruskin's 'Stones of Venice.' Tennyson's early works, Edgar Poe, Dickens, and, above all, Malory's 'Morte d'Arthur,' were among their favorite recreation. Morris had the custom of reading aloud to his friend while the latter drew. It was thus that in 1854 Ruskin's Edinburgh lectures became known to them on publication, and in them for the first time they heard of D. G. Rossetti and the Pre-raphaelite Brotherhood, and were filled with eagerness to see the pictures they read of.

Shortly after this the opportunity was

forthcoming, for Millais's "Return of the Dove to the Ark" was to be seen at Wyatt's shop in the High Street, and a visit to the Royal Academy made Holman Hunt's pictures of "Awakened Conscience" and the "Light of the World" known to them. At this moment Burne-Jones was commissioned by his friend MacLaren to illustrate some ballads for a book he had written upon the fairy mythology of Europe, and he set about the work with great zest, although under difficulties; but these designs were never completed. A sample of them is given: they are full of careful detail, but singularly unlike what came to be his method of expression. They rather suggest the influence of Cruikshank. About this time Burne-Jones and Fulford (one of the Pembroke set), under the guidance of Morris, who had been abroad before, made their first tour in France, visiting Abbeville, Amiens, Beauvais, Chartres, and Paris last of all, where the Louvre pictures transported Burne-Jones with delight, while Morris felt incensed at finding the statues of Notre Dame lying in careless wreck under the porches; the secrets of "restoration" thus becoming known to him.

Meanwhile, for some time, serious doubts had disturbed both the friends as to whether they were fitted for the clerical life. Burne-Jones, owing to his sensitive, emotional nature, went through an ordeal of intense mental suffering, so that he often felt tempted to seek relief by accepting the tenets of the Roman Catholic faith, an example the guides of his election, Newman and Wilberforce, had already given him. This, however, he did not do. Morris felt very differently on those matters; devoted friends as they were all their lives, they diverged essentially on many points. They decided, after deep questioning, to devote themselves to art—Morris to become an architect, and Burne-Jones a painter. It was before their last term at Oxford, at Birmingham, where Morris went to stay with Burne-Jones, that the scheme took shape to form a magazine in which to express the principles and aims and enthusiasms of their little coterie, and for the publication of original work. Politics were to be kept in abeyance. Tales, poetry, friendly critiques, and social articles were to occupy the pages. Morris was proprietor and furnished the funds. Two of the contributors, Heeley and Vernon Lushington, were Cambridge men. The other five were Morris, Burne-Jones, Dixon, Macdonald, and Fulford. The first number of the *Oxford and Cambridge Magazine*, as it was called, was sent to John Ruskin with a letter from Burne-Jones, and his delight and elation were great to receive an answer from the writer he much admired. An event which made a mark in Burne-Jones's development was seeing Rossetti's illustration to Allingham's "Maids of Elfenmere" in the 'Day and Night Songs,' which he always considered the most beautiful illustration he had ever seen, and which altered the character of his own work very essentially. His great ambition was to come face to face with the author of "The Blessed Damozel," "The Story of Chiaro," and the "Maids of Elfenmere." The manner in which this was brought about has been told already, in the lives both of Rossetti and of Morris, and of how Burne-Jones and Morris eventually gave up Oxford and came to live in London to practise painting, encouraged by Rossetti's advice and the generous interest he took in their progress.

It was at the age of twenty-three, when most painters have mastered the mechanical part of their craft, that Burne-Jones seriously gave all his attention to art, and set to work with untiring industry and application to make up for lost time. He had all the more reason for doing so in that he had just become engaged to Miss Georgina Macdonald, daughter of a Methodist minister, the lady who has written this book. The story of the courtship is told with great simplicity and feeling; throughout the book all intimate episodes are related with convincing truthfulness, which greatly enhance the value of the 'Memorials' as a human document. When the engagement took place, Georgina Macdonald was not yet sixteen. She had been brought up in the strict Methodist creed. She says: "I had no idea of what the profession of an artist meant, but felt that it was well to be among those who painted pictures and who wrote poetry." Rossetti did his utmost to procure remunerative work for Burne-Jones and to help him on in every way with counsel and cheer. Writing about him years afterwards, Burne-Jones says: 'Towards other men's ideas, he was decidedly the most generous man I ever knew. No one so threw himself into what other men did—it was part of his enormous imagination. The praises he at first lavished on me, if I had not had a few grains of inborn modesty, would have been enough to turn my head altogether." The story of the decoration of the Oxford Union Debating-room, undertaken by Rossetti and the friends he had chosen to help him, has been told before, but Lady Burne-Jones gives it with infinite life and humor, so that one gets an insight into the wonderful power and fascination which Rossetti exercised over his worshippers, as well as of his inability to conform to the conventionalities of the place.

With all the work going on, there was always an undercurrent of fun, and the humorous side was kept well to the fore. The painters were supremely happy when left to their own devices; polite invitations to dinner were their only trouble, but these were often eluded in various ways. What we learn of Rossetti through the medium of Burne-Jones's note-book and the author's own memories of him, shows the genial side of his character, not visible to those who knew him in later years when suffering from mental disorder, and so little revealed by his brother in his numerous publications. Here we have Rossetti in the full swing of artistic strength and activity, with will-power enough to inspire those around him with courage to undertake and achieve. Burne-Jones sums up what he learned from him in these words:

"He taught me to have no fear or shame of my own ideas, to design perpetually, to seek no popularity, to be altogether myself—and this not in any words I can remember, but in the tenor of his conversation always, and in the spirit of everything he said. I remember that he discouraged me from the study of the antique—the classical antique—giving as his reason that such study came too early in a man's life, and was apt to crush out his individuality; adding, that when a man had once found his own style, and was much older, and could front the fear of being crushed, a year or so given to such study would be an excellent thing. So what I gained chiefly from him was not to be afraid of myself, but to do the thing I liked most; but in those first years I never wanted to think but as he thought, and all he did and said fitted me through and through. He never harangued or persuaded, but had a gift of saying things authoritatively and not as the scribes, such as I had never heard in any man. And mingled with this a humor that lightened his words of all heaviness, so that I went from him cheerful and solemn. As I walked with him in the streets, I wondered what the crowd were so busy about that it could not stop to look at him. In the miserable ending years, I never forgot this image of him in his prime, and upbraided any fate that could change him."

Lady Burne-Jones has the art of showing people at their best, so that we get to know William Morris also in a more benign and genial disposition, as he was to his nearest friends.

In thinking over this life, the reader must feel how wonderfully fortunate Burne-Jones was from the moment his vocation became to him a recognized fact. Only the surroundings of his youth, so uncongenial to artistic development, could have so long retarded the discovery of his latent power. His pictures from the first bore the stamp of genius, and were admired by the greatest painters of a specially interesting moment in English art. From the public, it is true, he did not receive immediate recognition, and this was natural enough, his art being entirely exotic, deriving from the Italian Renaissance, the period he most admired, and utterly foreign to popular instincts. The best men of the time loved him and belonged to his circle; poets, politicians, and great thinkers all frequented his house. He had children he adored, and a delightful home. He had never to work under the strain of pecuniary difficulties; and, after the earnest work which occupied his best faculties, his nature renewed itself in real fun, as necessary to him as the bread of life. His fellow-painters desired to do him honor in electing him to the Royal Academy, and, later on, the Government conferred the baronetcy on him; and, best of all, he died in the fulness of his powers, still working on his favorite subject of Avalon. Surely, so fortunate a lot falls to few mortals, and its history is exceptionally interesting.

The book is illustrated by hitherto unpublished portraits of Burne-Jones, Ruskin, Morris, Rossetti, and family groups—some from pictures, and some from photographs and drawings. The text is interspersed with Burne-Jones's comic drawings and caricatures of himself and his friends, with which he used to fill his letters.

SOME RECENT BOOKS ON INDIA.

That Russia and Japan have not entirely eclipsed the more peaceful "middle Orient" may be concluded from the steady flow of books anent Persia and India. Some of the latest of these deserve for various reasons a wider recognition than that afforded by the technical reviews devoted to Orientalia. Among them, the latest volumes of the Harvard Oriental Series, though not appealing to the general public, should be mentioned, if for no other reason than to call attention to the excellent work done for Sanskrit scholarship in this slowly increasing collection. The fifth and sixth volumes, which have just appeared, contain the text of the 'Bṛhad Devatā,' a very ancient summary of Vedic myths, together with notes, seven

appendices, and a translation of the text by Professor Macdonell, Boden Professor of Sanskrit at Oxford. The work, of prime importance for students interested in this line of research, has been edited with the scrupulous care to which the American editor has accustomed those familiar with the volumes already issued in this series.

From England also (via India) comes 'A Handful of Popular Maxims,' being the third of Col. Jacob's excellent collections of proverbs, which offer much of interest to Sanskritist and layman alike. The little book is published in Bombay at the Nirnayasagar press. Sanskrit scholars should have a copy, not only to enjoy maxims already traced, but to help the author in locating the starting-point of some which have hitherto escaped the searcher of origins.

From France the first volume of the new year is the second part of the 'Conférences faites au Musée Guimet.' It contains four lectures, of which perhaps the most important is M. Philippe Berger's "Les Origines Babyloniennes de la Poésie Sacrée des Hébreux," though Sylvain Lévi's article on the transmigration of souls and Menant's "Parsisme" will be sure to find attentive readers.

Students of religious philosophy will be interested in another recent work (1905), the translation of the 'Bhagavad Gītā' by Prof. Richard Garbe, with an historical introduction which sets the date of this work (in agreement with the results attained by Professor Hopkins in his 'Great Epic') as 200 B. C. to 200 A. D., for the beginning and final revision, respectively.

Arthur Sawtell, who has before this devoted himself to some of the everyday problems of Anglo-Indian life, has just written a little book entitled 'Actual India' (London: Elliot Stock), which is designed to be "an outline for the general reader" of the problems and projects of British administration in India to-day. It is, in fact, a useful handbook, "up to date" as regards statistics, and (as regards other facts) a compilation of what one must otherwise hunt for in the voluminous works of Chesney, Hunter, and other Indologists, though it would not be fair to say that it is wholly a résumé of other books. India's government, defence, and industrial development are the chief topics treated; but the character of British influence in India and foreign politics are also considered without undue prejudice. Those inclined to see in the "Younghusband raid" a mere pretext for expansion would do well to read pages 62 ff. of this little manual, and those who are more than willing to blame England for increased cost of living in India and higher taxation should study "the significance of the figures" on page 72; the author's conclusion being that "the tendency is to greater and greater liberality in the assessment of land revenue, so that these statistics relate to conditions which are probably changing in favor of the cultivator."

Much more pretentious is the 'India' volume in the new series called "The Regions of the World," edited by H. J. Mackinder (D. Appleton & Co.). This volume is written by Col. Sir Thomas Hungerford Holdich (late superintendent, Survey of India), already known to the readers of the *Nation* through his admirable volume, 'The Indian Borderland,' reviewed in these columns four years ago. Avoiding "statistics and details," the author has here compressed into one volume an immense amount of geographical and ethnological information regarding the peninsula itself and the frontier, Baluchistan, Afghanistan, Kashmir, Assam, and Burma. To this are added chapters on the people, political geography, agriculture, revenue, railways, minerals, and climate. A general historical chapter, which is perhaps the least satisfactory, is prefixed to the whole. The most valuable part of 'India' is, of course, the geographical description, where the author is on his own ground. The literary-historical side is mortar to the bricks of the altar. A second edition should modify the extraordinary statement that Brahmanism spread over the whole of Southern India "about 2000 B. C.," to which period is also assigned the 'Ramayāna' (*sic*); change the strayed accent of "Ramayāna"; and do away with the phonetic incongruity of "Brahman" beside "Grunth" (pp. 12, 201, 210). The maps and diagrams, more than a hundred in number, are a noticeable feature of this excellent work.

Almost synchronous in appearance, and complementary in content, is 'The Early History of India' (Oxford: Clarendon Press; New York: H. Frowde), by Vincent A. Smith, author of 'Asoka' in the "Rulers of India" series. This history embraces the period from 600 B. C. to the Muhammadan conquest. A few years ago it was a trite remark that India had no history. The painstaking work of the last two decades has, however, changed all that. Buddhist records and Sanskrit inscriptions have in part made good the lack of historical sense in Hindu mentality, and there is something like a chronological record even from the seventh century B. C., which is as far into the past as Greek and Roman histories can take us with assurance. There are still many disputed points, some of them involving not years, but centuries; yet scholars are gradually coming to an agreement even on these, and it will not be surprising if in a few decades historians of India will have cleared the field sufficiently to smile at the grave problems of to-day. Kālidāsa, the Hindu Shakspere, no longer swings between B. C. and A. D., but has settled into the fifth, "or possibly the fourth," century A. D. Kanishka, one of the great kings in Indian history, second in importance only to Asoka, is still throned by some scholars in 57 (*respectiv* 58) B. C., and by others in 278 A. D.; but such works as this 'Early History' do much to dispel darkness even in so black a cloud of doubt as this. Mr. Smith, on numismatic evidence backed by other lines of proof, sets the date of Kanishka's accession about 120 or 125 A. D. The absurd dates ascribed not long ago to the Purānas have already been reduced within reasonable limits. The oldest Purāna is probably the 'Vāyu,' and this is not older than the fourth century A. D. in Mr. Smith's opinion, though, as the epic knows them all, this is probably two centuries too late. No one has done more to perpetuate some of these ancient errors than Sir William Hunter, who was a great compilator, but not at all a scholar. There is naturally still plenty of room to cavil when dates are based simply on generations. For example, Mr. Smith rejects as "absolutely incredible" a dynasty of one hundred years for two generations (as with more reason he rejects one of one hundred and fifty years), whereas forty years to a generation is a "reasonable" assumption. As to that burning question in Hindu chronology, the death-date of Buddha, which Mr. Smith in his 'Asoka' set at 508 B. C., it is now placed in 487; while Asoka accedes to the throne not in 269 (as in 'Asoka') but in 272. Exception may be taken to the strange remark that the Bias river was in early days not a confluent of the Sutlej (p. 85); for the 'Rig Veda' says that one flows into the other.

For our "general reader" this is perhaps all (or more than) he will care to hear about such a recondite subject. To the classical reader, however, it will be of interest to know that a disproportionately large part of Mr. Smith's book is taken up with Alexander's campaign and the records of Megasthenes. In fact, nearly a third of the volume is occupied with Hellenic activity and influence in India, and there is nowhere so complete and vivid an account of the great campaign as is to be found in these pages. Mr. Smith accepts July, 326 B. C. as the most probable date of the battle of the Hydaspes, with Pōros, and gives good reasons for maintaining (in opposition to earlier writers) that the great battlefield was the Karrī plain, Alexander's camp being at Jihlam (Jhelum), not at Jalālpur, as Cunningham maintained. Even those not interested in India for itself cannot fail to be attracted by this chapter in the life of Alexander, which in some regards at least may be accepted by historians as a definitive statement.

Studies in Montaigne.—The Early Writings of Montaigne, and Other Papers. By Miss Grace Norton. The Macmillan Co. 1904.

These two attractive and scholarly volumes represent the results of painstaking study, for the most part along lines of investigation which the ordinary *Montaignard*, however devoted or enthusiastic, dispenses himself from travelling. In the former are contained a number of studies of a minutely critical character, dealing with almost unnoticed points of erudition bearing chiefly on possible divisions of some of the longer essays into perfectly discontinuous parts subsequently united for the sake of convenience, or perhaps because of the author's fondness for what Bacon called "dispersed meditations." To the student, much the most important of these concerns the ingenious separation of the 'Apologie de Raimond Sebond' into sections possibly composed at various times, and consequently admitting of distinct discussion; though, we may add, it is by no means proved that there is in them any fundamental discrepancy of view, philosophical or theological. This celebrated essay simply illustrates the supreme difficulty of pinning such a pliant, yet independent, mind within the narrow area of dogma and formal creed; as in the case of 'Religio Medici,' we find it possible to see chameleon-like changes in the color or intensity of religious belief, while yet recognizing the essential reverence of a pious nature. As to "The Credulity of Montaigne," which forms the subject of a brief note, it does not to us appear exceptional in the inheritors of the spirit of the Revival of Learning, for whom the testimony of antiquity was sacred. In the mat-

ter of Montaigne's style, which, we are here told, is at times more direct in its appeal, and more readily intelligible to the English than to the supposedly typical French mind, the assertion seems difficult of reconciliation with the well-known fact that the essays have been a bedside book for countless scores of Frenchmen; it certainly offers no real difficulty to the ordinarily educated Gallic intellect, and even its *phrase ondoyante* is a constant delight. The minuteness of research in this set of studies is illustrated in the final enumeration of the principal sources of Montaigne's abundant classical quotations.

Part of the second volume reminds us of chapters in Prof. Paul Stapfer's 'La Famille et les Amis de Montaigne,' likewise composed of a set of independent talks or lectures. Miss Norton, who gives her readers a most sympathetic account of the last days of Étienne de la Boétie, devotes particular attention to Montaigne as a traveller, and to the stimulating society of writers and scholars at Bordeaux in his day. One of her most attractive conjectures suggests the possibility of meeting and intercourse between Bacon and Montaigne at Poitiers in 1577, on the strength of a fairly probable interpretation of a passage from 'Historia Vitæ et Mortis.' To Montaigne's travels in search of health Miss Norton gives one of her most entertaining essays, going over the ground with the admirable talker, and insisting with perfect judgment on the humanity and breadth of his comprehension; the judgment passed, in a brief footnote, on Mr. W. J. Waters's recent translation of the travels might bear revision.

Altogether, both sets of studies (in spite of a few inevitable repetitions) are extremely readable and suggestive; executed, too, with the patience of a devoted student, whose results, however, have not been fairly assisted by the proofreader. Indeed, Miss Norton's work is from beginning to end a direct negation to Professor Stapfer's gratuitous *boutade:* "Il n'y a vraiment aucune raison pour que les femmes se plaisent à la lecture de Montaigne; car il n'a guère dit sur leur compte que des impertinences, beaucoup d'incongruités et quelques sottises."

Japan by the Japanese: A Survey by Its Highest Authorities. Edited by Alfred Stead. Dodd, Mead & Co.

In some respects this book is unique. Probably for the first time since Japan began to have a history, the Emperor has given permission for the dedication of a book to himself. In time past his ministers have accepted handsomely bound copies of books on Japan by foreign authors, only to tear out the autographs of the donors because of critical remarks made concerning "the Tenno." The contributors to this volume are among the highest officers of the Government, including two or three premiers, and others who are or have been eminent or subordinate in the executive service. The most enjoyable papers are by native gentlemen of fine literary culture well known on three continents. The book has documents, tables and digested information of high value; and prefatory matter, appendices and carefully prepared index make it a necessity to all who would write about Japan.

Mr. Stead's preface is thoroughly characteristic; and his profound ignorance of the real significance of the work of such men as Sir Ernest Satow, Mr. William G. Aston, Prof. Basil Hall Chamberlain, and Capt. Frank Brinkley is manifest. Granted (what is self-evident) that it is, as the editor repeatedly declares, most difficult for any foreigner to speak authoritatively on Japan, yet the literature of the nation, archaic, mediæval and modern, makes no mistake and cannot possibly misrepresent. The real thoughts of the Japanese, set down during the thousand years of their thinking, give no uncertain testimony, and their literature tells far better than 'Japan by the Japanese' in 1904 what these people really think. In this volume we have a "personally conducted" author to assemble the materials with a purpose and write the prefatory label, and with the usual result. The uncritical reader sees with the glasses furnished him. Mr. Stead's book is like those on Mantchuria written a year or two ago by gentlemen who were wined, dined, and escorted over beaten tracks by their pleasant Russian hosts, the Government officers. It is certain that the elder native authors who wrote without view of the alien are more to be depended on than those of to-day, who, knowing the value of the sympathy of Great Britain and the United States, tell us in the catchwords of the present hour what we ought to believe concerning themselves and their country.

The bad proofreading and continual misspelling of Japanese names and terms are disgraceful, but may have arisen from the reported illness of the editor during the progress of the work. The internal evidence is, however, overwhelming that the translation of many, if not most, of the papers was done by a single person using the same vocabulary, coloring of ideas and phrases that are supposed to be most immediately captivating and effective. In view, however, of Mr. Stead's long paragraph about a certain work on the geisha as representative of the women of Japan, it is apparent that he imagined that the bulk of his readers were conversant chiefly with the works of Pierre Loti. Certainly, he seems to have slight knowledge of the wealth of serious works on Japan not only by aliens, but by the Japanese themselves, on the lists of American publishers and in our public and private libraries. In its cast and scope, this book seems intended mainly for the British reader. It is certainly very rich in information for the investor anxious about Japanese finances.

At first sight, the varied contents appear to defy the reviewer's efforts to do justice to the text. Yet when he has read the work entirely, as we have honestly done, the mass divides itself into the literature of knowledge and the literature of power. Most of the chapters are as dark lanterns. A few are as lamps set in a reflector or behind a Fresnel lens. At least three-fourths of the matter in this book takes its place honorably and humbly along with that in the 'Résumé Statistique' or 'Annuaire' of finance which the Imperial Government has praiseworthily issued for a decade or two of years past, and which have been duly noticed or digested in these columns. The facts and figures concerning the army, navy, revenue, taxation, and things outward and material are invaluable in their way. We refer to them only to commend. In the fifty-four pages of appendices we have the text of the Constitution of 1889 and of many of the most important Imperial ordinances.

This collection of papers is anything but monotonous in style or form. One reads almost with an electric tingle the criticisms of Count Inouyé and Baron Shibusawa. For thirty years these two men have been unflinching and thorough in probing the weak spots in the national character and of the old haphazard methods of finance, cheerfully bearing abuse. They have played the same part in the Meiji era that the outspoken critics of the old Yedo régime played in the second third of the nineteenth century, the latter in the face of imprisonment and death. These two writers carry out in an eminent degree the professed purpose of the book, and inspire confidence as others do not. For example, in the chapter on "The Imperial Family," by Baron Sannomiya, this consummate Chesterfieldian, who acts as the court chamberlain, tells us what went on—outside of the imperial family. His text is interesting, but gives us scarcely a hint of the private life or daily routine of the chief ruler of Japan, or of the real machinery of government in the palace. The chapters on politics are simply the old speeches of the Marquis Ito with some historical matter. Marquis Yamagata speaks with the frankness of a soldier and with more illumination. If, in Baron Kaneko's paper on the "Organization of a Modern State," his fluent English words had the depth and meaning which a thousand years of struggle for constitutional government in England make them mean to us, the student would be delighted and surprised, but there is a difference between the coin's stamp and the metal itself. The papers on the army and navy are clear and full. Under the head of "Diplomacy," Professor Ariga writes in delightful style, and is especially full on the subject of Korea. While thankful for this as a notable contribution to history, the critic who knows the Korean side of the events described will not be sparing of his salt. Some of the omissions are surprising, as of the influence of Gen. Grant in the Riu Kiu compilation, while nothing is said of the Joint High Commission which discussed the matter in Peking. The great theme of treaty revision is robbed of vitality in its treatment, through excess of diplomatic caution and perhaps an excusable desire to show how successful Japanese diplomacy has been. Count Okuma adds a mere fragment from his speech of 1887 in the Lower House.

One turns to the chapters on Education to get some real light on the problems involved, but, except from the pen of Count Okuma, always the champion of independent study and the ceaseless enemy of Japan's excess of red tape, we find little but pragmatic narrative. Baron Suyematsu, who wields a brilliant pen, writes most attractively on "Woman's Education," but here, except on matters historical and already commonplace to the well-informed, the oracles are dumb. What the purchaser who spends five dollars for this book wants to know about woman's education is this: Does the Japanese man want his wife or sister educated equally with himself—not necessarily in exactly the same way, but with equal opportunity for self-improvement? The total ignoring by the Government of the higher education of women does not help to answer the question. Eager

for light on this question, we turn to the end of the book to read a short paper on "The Position of Woman," by Professor Jinzo Naruse, founder of the first and the only university for women in Japan, and a private institution. Again we find historical data, but cannot learn whether Japan honestly wants to be civilized in the sense in which nations that give woman opportunities for culture are civilized. In a word, the Japanese, on these questions of vital import, treat the reader as if he were a war correspondent.

The chapters on "Religion," while charming as literature, are even more disappointing than those on Education, unless we abolish the distinction between ethics and religion, or even if we accept Matthew Arnold's definition of the latter as all-sufficing. Professor Nitobe, in fascinating style, writes on Bushido (the knightly code) and Patriotism, highly idealizing the actual Bushido, which had waxed old and was dying when he was born, and is now long dead. The code-lawyer, Professor Hozumi, in treating of ancestor-worship, would have us believe that it was an indigenous product of Japanese soil—which no scholar has yet proved—and not an importation from China. Neither Buddhism, which has been the great civilizer and is the heart of Japanese popular life, nor Shinto as a system, nor Confucianism, which not only furnished the daily moral law for the people, but the creed of the gentleman for centuries, has any place in the descriptions or discussions of this volume. In treating of Art and Literature, the writers correct some errors of foreign writers, but contribute little that is fresh or revealing.

Palio and Ponte: An Account of the Sports of Central Italy from the Age of Dante to the XXth Century. By William Heywood. London: Methuen & Co. Pp. viii. +268, with twenty-seven illustrations.

Once the eager traveller has explored the great Italian highroads, the bypaths still remain. More and more the habit of regarding the whole of Italy as one vast museum will grow on him. An arch, a doorway, a trellis, will suffice to suggest a vision of the past; not only the half-forgotten master seen in some mouldy chapel perched on a vine-girt scarp of the Apennines will attract him by its savor of another age, but life as well as art will recall antiquity in a hundred forms. What can be more pagan than the harvest offerings of corn before the roadside altars of Venetia? Or what more mediæval than the ancient *trattrorie* of Italian towns—the Corte dell' Orso at Venice, with its antique well-head, or the subterranean Lapi's at Florence, where, in the vaults of a *quattrocento* palace, the *popolo* partake of Protean macaroni, almost in the nature of a sacrament. And though Italians have "a miserably low standard of intoxication," Bacchus in Italy well deserves the study recently given to him by a learned Teuton, and Arquà is as famous for its local vintage as for having been Petrarch's last place of residence.

It is not only the triple-starred in Baedeker which enchants. The marionettes in Venice still sing delightfully Paisiello's operas to an audience of gondoliers, and everywhere from the lips of the people fall exclamations as picturesque as any sight-ridden monument worn threadbare with praise. The writer well remembers an old *custode* at Perugia, worthy descendant of Matarazzo, describing the crimes of a lunatic who, on his return from a pilgrimage, cut the throats of his wife and children and afterwards killed his oxen and his cows. He finished his tale, saying like a chronicler of old, "Thus, 'twixt Christians and animals, he slew eleven"!

In 'Palio and Ponte,' Mr. Heywood has explored one of the most interesting and least known of Italian byroads. The spirit of sport in Italy, far from being merely the healthy exercise it has become in Anglo-Saxon communities, was closer to the Greek idea of games. It was at the same time the result of rivalry, generally between different communities of the same locality, and often the civic celebration of some historic event. Its study thus assumes real importance in the life of the Italian mediæval city; and the still surviving Palio at Siena, or the now deceased Giuco del Ponte at Pisa, must attract the student of the ancient Tuscan communes. Mr. Heywood has undertaken his study of these sports in the spirit of a true historian, and his researches have revealed a new side of Italy to English readers. In his description of these remnants of popular chivalry he has chosen a novel subject—not the Italy of sweet smiling virgins and ecstatic saints, nor yet the land of intrigue and poison. We are far too prone ourselves to search in the past only for the extreme. Yet then, as now, the vast majority, like Pier' Soderini of Tuscan epigram, could aspire only to Limbo. Not every one was either saint or demon, and even those who were had redeeming sides which humanized them. Mr. Heywood shows us Lorenzo de' Medici, Sodoma the painter, and Cæsar Borgia, like any English prime minister at the Derby, racing their horses at Sienese *palii*. We discover Cæsar Borgia's jockey using questionable tactics, as his master used questionable politics, and when the judges refused to award him the prize, he wrote to them demanding it. But our author is more than a student of archives. He has bursts of eloquence in his style. No amount of description can here take the place of a direct quotation of the lines in which he apostrophizes Pisa:

"To Pisa, great and powerful while yet the Greeks fought beneath the walls of Troy, whose more than thirty centuries laugh to scorn the pinchbeck antiquity of other cities; beside whom even Rome is young; to Pisa, Lady of the Sea, the mart of all the West and all the world, the conqueror of the Balearic Isles, of Sardinia and of Corsica, the scourge of the Infidel; to Pisa, *Tusciæ Provinciæ Caput* for twelve generations ere yet the upstart Florence dared to contest her hoar supremacy; to whom the Emperor of the East paid tribute; whose consuls owned no less or lower fount of their authority than the Almighty Himself; to Pisa, the Imperial Ghibelline to the last—belongs of right the foremost place."

We suspect that the possible charge of partiality to Siena may have inspired these lines, for Mr. Heywood's previous books prove him a Sienese at heart. He has even inherited the prejudices of that city of the hills. Florence to him is still the object of anathema. It is true that her cunning panegyrists had long gained the ear of Christendom. "Only within the last few years have men begun to perceive that many of her glories are borrowed glories, and all her crimes are her own." Thus does he perpetuate the hoary savor of a hatred grown venerable with centuries. His book, however, is no less interesting for this. He has interwoven a vast amount of local history, especially Sienese, since no Anglian, save perhaps Mr. Langton Douglas, knows his Siena better. But Mr. Heywood has something of the Berserker in him, which aids him to appreciate the spirit of the Middle Ages. His account of the battle of Montaperti is a thrilling bit of historical narrative, which those who know the picture chronicle in the library at Siena will relish. Mr. Heywood tastes what he describes. He has gone to the sources not merely in his facts, but in his inspiration. He has not compiled a book, but has written one for which all lovers of Italy can only be grateful.

Bucking the Sage Brush; or, The Oregon Trail in the Seventies. By Charles J. Steedman. G. P. Putnam's Sons.

The sub-title suggests a classic, but the book makes no claim to classic pretensions. It is too truthful, and adheres too closely to fact, to be a popular narrative of travel, and its flaws of composition preclude it from comparison with Parkman's first memorable work, 'The Oregon Trail,' written before his own style was spoiled by yielding to the temptation of florid writing. Our author does not err in that direction, but he weakens his simple description of a vanishing phase of Western life by indulging in facetiæ and commonplace Western slang. The charm of the book, nevertheless, lies in its being a straightforward, unromantic story of a cowboy's experience while driving a herd of cattle across the northern section of the Rocky Mountains long before the Northern Pacific, the Great Northern, or the Oregon Short Line was built, and when the only transcontinental road was the Union and Central Pacific. Though the party passed through this territory when the Indians were on the warpath, he personally witnessed no gory massacres; and though the trip was made in the period of horse-stealing and consequent lynching, he saw nothing more suggestive of lawlessness than a burglar's mask in an abandoned cabin. In these respects his horseback ride from the Columbia, across Idaho, into Wyoming was as uneventful as is the journey to-day of most travellers by rail, if they avoid saloons and gambling houses. It was the real West which he describes—not that of Buffalo Bill's show.

Our author, like many another Eastern youth, left an Eastern office to become a cowpuncher under the mistaken conception of what Western life really means. Yet, though he has returned to civilization and warns his readers to dismiss illusions and look reality full in the face before following his example, he found the outdoor, untrammelled life of the range sufficiently attractive to induce him to spend some nine years of the best period of his early manhood in the Rocky Mountains. After serving a short apprenticeship on a ranch in Wyoming, he and three other Bostonians, as inexperienced as himself, combined their ignorance and their capital into a cattle company, and two of them started to scour the West for a herd of

steers. They first tried southern Utah. There they found no stock; but though they discovered, even in those early days, that the Mormon Church had created an industrial oasis in the desert of Western extravagance and recklessness, he has not a good word to say for its members. He and his partner next tried Nevada, but with no better success. They then turned their steps toward Oregon. For more than thirty years previously, immigration from the East had entered it over the Oregon Trail, and during that interval the immigrants had raised great herds of cattle, for which no market could be found on the Pacific Coast, and which could reach Eastern ranges only by being driven over a thousand miles of dangerous mountain trail and swimming boisterous Western torrents. The prices, therefore, were low in proportion to the greatness of the risk run by the purchasers. Here, therefore, our Boston lads invested in some three thousand head of cattle at about $10 per head, in a wagon and team, and in a drove of horses, as each cowboy needs about ten. They hired a cook, a clerk and cowboys, and commenced their arduous ride from Walla Walla in Oregon to Laramie in Wyoming.

Many another experienced the same hardships and met the same mishaps during the following seven years, when over half a million head of cattle were driven by the same route from the same pastures in Oregon and Washington before the Northern Pacific was built, but no one of them except our author has told how these vast herds were handled by a few dexterous cowboys. If he would write another book and describe the transformation which the cattle trade of the West has undergone, he would increase our obligations. The day was, when Texas from the Gulf to the Rio Grande was one vast cattle range; but little by little the rancher has driven back the ranger until cultivation now extends to within less than two hundred miles of the New Mexican line. The Reclamation act puts it within the power of the President (and he is now using his prerogative) to exclude from further occupation such tracts of the Western territory as may possibly be brought under artificial irrigation; and he may include in forest reserves denuded areas where no tree can grow while cattle are allowed to range at large and destroy the young shoots, but where, within two or three generations, a vigorous forest would clothe the soil were cattle absolutely debarred. From these two sections of the national domain, where heretofore the cattle owner has fed his herds wherever they were within reach of water, without the payment of rent or royalty, he is being excluded. The largest available tracts of pasture are probably in Arizona and in New Mexico, but in years of drought the ranges are overstocked with walking skeletons of perishing cattle. Those which have not succumbed are saved from starvation by being carried under emergency rates by the railroads to the East and West and North. At best all the cattle from these arid plains and mountains have to be fattened on the succulent prairie grasses of Kansas and Nebraska before they are fit for the market. In Mexico alone are there still such herds as once accumulated in the Northwest; but customs duties and quarantine regulations interfere with their free access to our markets. And there alone, also, must such herds from certain sections be driven hundreds of miles on their own hoofs, for to the north of the line only have the railroads almost everywhere obliterated the old cattle trails.

Literary Geography. By Mr. William Sharp. Scribners.

This very attractive-looking volume is profusely illustrated by half-a-dozen artists, including Greiffenhagen. Mr. Sharp takes his subject partly by authors, and partly by localities, when, as with the English lakes or Geneva or the Thames, the literary associations crowd too thickly for separate treatment. Literary geography, in these days of pilgrimages to every hole and corner that has associations with an author or his forebears, has developed into a special type of descriptive literature, almost with a style of its own. It is the opportunity of the rambling writer with a turn for humor and anecdote, and has transformed bicycling and walking tours into profitable investments. Mr. Sharp ranges through the country of Meredith, Stevenson, Dickens, Scott, George Eliot, Thackeray, the Brontës, Carlyle—well-trodden ground all this, and not so very wide, if one confines one's self to the regions where an author has spent his time, and does not venture into the lands that he has brought under the sway of his imagination. Mr. Sharp compromises, follows the wandering pen now and then, but keeping almost entirely to the British Isles.

The chapter on "Aylwin-Land" will surprise a good many of his American readers, who can hardly have realized the vogue of the late Mr. Watts-Dunton's novel in Wales and East Anglia. Mr. Sharp declares that no Welsh home is without a copy of 'Aylwin'; that it is the representative romance of North Wales and East Anglia, north of Lowestoft, and wonders "if any other first romance has ever had so swift and so great a success." He writes, moreover, as though George Borrow's pictures of gypsy life, in 'Lavengro,' had been thrown into the shade by the gypsies in 'Aylwin.' This seems to us the partiality of friendship. In connection with the author of 'Aylwin,' Mr. Sharp gives some interesting and rather alarming statistics of the "torn beaches and snatched lands and submerged shores" along the southern and eastern coasts of England. Thirty-four towns and villages and many hundreds of square miles of territory have been lost "during the modern period."

Mr. Sharp's humor is often rather trivial, and occasionally he writes wildly, as on page 97, where he speaks of 'The Green Carnation,' that obsolete satire of Mr. Hichens, as "the most brilliant satirical comedy given us since the vast drama of 'Vanity Fair.'" On page 94 he speaks of Loti's famous novel as 'Les Pêcheurs d'Islande.' Elsewhere (p. 226) he makes a curious mistake about the Comtesse d'Agoult, whom he calls "the sister of Liszt." The Comtesse d'Agoult, better known by her *nom de plume* of "Daniel Stern," was the mistress of Liszt, with whom she ran away from a ball, forsaking for him her husband and child and a brilliant social position in Paris. Mr. Sharp's anecdotes are numerous and amusing. He derives from Mr. Andrew Carnegie the tale of "the American cyclist who, when skirting the shore of a solitary Highland loch, noticed a boat in which was a man languidly examining the depths with a water-telescope. Now and again he would pause and chat with a friend who sat on the bank reading a newspaper, or he would lay down the telescope and light his pipe. The American could not restrain his curiosity, and at last asked the idler on the bank, 'What is your friend looking for? Oysters?' 'No,' was the matter-of-fact reply; 'my brother-in-law.'"

The Romance of Isabel Lady Burton: The Story of her Life told in part by herself and in part by W. H. Wilkins. Dodd, Mead & Co. Pp. xviii., 778; portraits and illustrations.

In the romance of marriage and the married life there is not a brighter and more hopeful page than that which tells of Richard Burton and his wife, Isabel Arundel. Of no man could it apparently more certainly be said than of Burton, on the basis of his repeated judgments and elaborately developed theories as to the relation of the sexes, that his married life, with any woman of character and ability, must of necessity be a colossal failure. Yet it is perfectly clear that not only did this pair achieve the decent mean of getting along together, as it is called, but that they thoroughly loved and trusted one another; that she gave him the most complete devotion of a very fervent nature, and that he responded so far as was in him. The secret of it all undoubtedly lay with Lady Burton. She was a very clever woman and a very good woman; she had infinite tact, and she set out from the old-fashioned position of giving her life to her husband. The seventeen rules which she drew up before marriage for her guidance as a wife may read queerly to our modern notions, but, certainly for her husband at any rate, they were sovereign, and they give the clue to her success. And with it all she retained his respect and affection. Anecdotes in circulation tell of the calm insistence with which she, up to the end, kept him to the little details of observance and courtesy which he was somewhat apt to let slip. They were very unusual people, and had a very unusual life, both with each other and with the world—"ganz verrückte Leute," one observer at Trieste said; but they were also, in their way, a model couple. Assuredly, the wisest thing Richard Burton ever did was his marriage.

And so, again, the question cannot but rise whether the Burton of his books was the whole man or the most fundamental part of the man. No one can read his commentary on the 'Nights' without a shiver at the possibilities which would have lain in its coming to the eyes of his wife—of any wife of any husband. Yet, though he kept it from her, he could not, during almost thirty years of the closest comradeship, have kept himself from her. If any one knew him, she did, and therein must lie his truest vindication and that against himself. Even reading the MS. of 'The Scented Garden' did not change her faith in him; it only made her guard his memory by an act which all who know the facts must approve and reverence. And it may easily have been a self of his of which he was only partially conscious, that she

knew; and yet the most real and guiding self after all. We, as we know ourselves, are seldom our absolute selves, and are sometimes strangely perverted selves.

To such moralizings a book like this must inevitably lead. But it sends, too, a clear wind of honesty, fidelity, and good sense blowing through the miasmatic vapors of our current marriage discussions. When ten-year terms and matters the like are on the carpet, it is most opportune that the record of the married life of the Burtons should again appear. As the present is a second edition, a detailed review is unnecessary. It is enough to say that, simply as a biography, this book must stand high, but it stands higher still for the united lives of which it tells.

Multiple Personality: An Experimental Investigation into the Nature of Human Individuality. By Boris Sidis, Ph.D., and Simon P. Goodhart, M.D. Appletons.

This interesting study of multiple personality is dedicated to William James, and made up of a good deal of theoretic speculation on the nature of personality, of discussions of already recorded cases, and of a detailed account of the remarkable case of the Rev. Mr. Hanna. In discussing the first of these topics the influence of M. Pierre Janet's "dissociation" theory preponderates; there is no consideration of Myers's "subliminal self," and one feels that nothing definitive can as yet be claimed for any theorizing about so obscure and novel a subject. The third part contains some acute remarks and criticises some well-known cases; the second is central both in position and in interest.

As this fact is indicated by the authors themselves in the preface, we need make no apology for drawing attention mainly to the very instructive case of double personality to which pages 83-229 are devoted. On April 15, 1897, the Rev. Mr. Hanna, a vigorous young Baptist minister, was thrown on to his head in a carriage accident. He was picked up unconscious, and for two hours his life was despaired of; then he opened his eyes, arose, and attempted to push one of the doctors. They, thinking him to be delirious, tried to keep him in bed, which led to a struggle in which the patient developed "herculean" strength, and had finally to be tied down. From further observations it gradually dawned on his attendants that, as a result of this fall, the whole of the knowledge acquired by Mr. Hanna from the day of his birth had disappeared. He was reduced to the condition of a new-born infant, unable to speak, to interpret his sensations, to control his limbs, to take food or to demand it. But, still more strangely, he was an infant with an adult intelligence, keenly interested in the development of his experience, observing everything, and capable of remembering his whole history after the fall and of describing with a trained intelligence his gradual initiation into a new world. In short, his case presents philosophers with almost exactly the information they have so often and so vainly sought to derive from a conjectural restoration of the "psychological baby." For apparently the shock which had driven underground Mr. Hanna's whole past life, had left his mental powers unimpaired. He proceeded in consequence to learn with the most marvellous rapidity. On the Saturday morning he discovered that he had been feeling intense pain in his head, by its cessation! This led to complaints on its return, which alarmed the doctors, who interpreted it as meaning that he now felt it for the first time. The accounts of how his senses came back one by one, of how he realized the independent existence of other persons (by the "pushing" experiment mentioned above), of how he acquired a conception of space and learned that the "out-of-doors" of several windows formed one big "out-of-doors," are most instructive and entertaining. His ready appreciation of mathematical truth (pp. 150-1) would have seemed to Plato conclusive evidence of the truth of his theory that "learning" was really untaught "recollection" of truths known in a previous life; and, indeed, such unconscious "lapsed" knowledge was the explanation of his performances.

These led the doctors to suspect that his former life, though submerged, might not be irrecoverable, and to effect his cure they proceeded systematically to exploit this clue. It was soon discovered that he had vivid dreams, *which were really memories of his past life*—again a discovery which would have delighted Plato. Since, therefore, the memories still existed subconsciously, might it not be possible to reknit the severed strands of association? The patient was asked to close his eyes and to listen attentively to literature which had been familiar to him in his previous existence. When the reading was abruptly stopped in the middle of a sentence, Mr. Hanna exclaimed, "I remember," and recited the whole passage, which, however, he immediately again forgot. Dr. Sidis gives the name of "hypnoidization" to this method, which will remind readers of Kipling of the exact procedure adopted in 'The Finest Story in the World.' Persistent experiment systematically encouraged these subliminal uprushes in hypnoidal states, until, one night in June, Mr. Hanna awoke in his primary personality, completely ignorant, of course, of his whole life since his fall, and unable to believe the story told him until convinced of the lapse of time by noticing how much earlier it got light. After this a period of alternating personality set in, which was of course very inconvenient because neither personality could remember the other. Finally, *both* lives came up together in memory, after a prolonged struggle, in which they grew "more and more personal, until at last by a deliberate, voluntary act, the two were seized," and Mr. Hanna thereby reunited himself and became able to write a most interesting autobiographical account of the whole affair.

Truly, one of the most fascinating of the fairy-tales of science, for the observing and recording of which Dr. Sidis and Dr. Goodhart deserve all credit. The success of the psychological treatment also may fairly be quoted by Dr. Sidis as a substantial confirmation of the theories which inspired it. And yet it is not logically conclusive, and raises perhaps almost as many problems as it solves. For neither in physiological nor psychological terms is the continued existence, subconsciously, of intact split-off personalities easy to conceive. But one feels also that by dealing effectively with such cases psychology is at last beginning to show that it can get hold of and operate on the real constituents of soul-life, and is ceasing to be merely a rather pedantic play with learned technicalities.

Hispano-Moresque Ware of the XVth Century: A Contribution to its History and Chronology, Based upon Armorial Specimens. By A. van de Put. London: Chapman & Hall; New York: John Lane. 1904. Pp. vi., 104.

Of all the ancient wares which have and deserve a great reputation, the Spanish lustred pottery is the most accessible, and yet this is the first orderly and intelligent treatise devoted to it. Many private collections have undoubtedly original pieces of great beauty; the variety of design among them is very considerable; nothing in the way of ceramic decoration is more effective, when placed at a little distance from the eye (as upon the walls of a sitting-room), than these round platters—and yet to this day the ware is treated as if it were a mere step in the advance toward the majolica of Central Italy. In the excellent Fortnum Catalogue of majolica and the kindred wares issued by the South Kensington Museum in 1873, forty-eight pieces are named, and woodcuts of two or three are given, among them a noble vase; but it was not thought worth while to devote a colored plate (of the dozen in the book) to those admirable wares of Spain. Baron Davillier, that enthusiast for early Spanish art, gave us, in 1861, a brief treatise on the lustred potteries, and in 1892 Émile Molinier, writing carefully, could only say that Davillier's book (probably in a subsequent edition) was still the latest contribution to knowledge upon the subject. Lustred wares of Italy and those of Persia and the neighboring lands have been more fully studied, and one is left in doubt whether it is the paler color, the silvery tone, the effects of gray and gold, which are to so marked an extent less popular than the deeper hues of Persian and Central Italian wares of the great time.

The book we have in hand goes far to supply the obvious need of a manual. It is a small quarto with thirty-four plates, of which three, with five specimens of the ware, are in color, the rest being in the usual black-printed half-tones. The pieces illustrated come from the British Museum, the South Kensington Museum (whose new name foreigners are slow to learn), the great collection at the Sèvres porcelain manufactory, and from many private collections. There is a large-scale map of the seacoast near Valencia, and a table of descent of the later Kings of Aragon and their allied princes. Many little cuts of armorial achievements are set in the text to help in the genealogical studies of origin; and we are reminded that the book is more especially a study of pieces identified by armorial bearings painted on them.

The text makes no pretence to be a history: it is brief, and plain in its recognition of the fact that the material for a history is lacking, as yet. This general treatise occupies half the volume, and is followed by rather full descriptions of some of the plates, though the system followed is a little confused and confusing. Still, it suffices to explain the author's warrant for the dates he gives, in arranging thus thirty pieces, chronologically placed between 1430 and 1500 A.D.

Sunny Sicily. By Mrs. Alec Tweedie. Macmillan.

By its aim, its general appearance, and even its title, this book seems to challenge a comparison with the 'Picturesque Sicily' of W. A. Paton (1897). The fact that the present volume is larger, is due partly to typographical differences and more numerous illustrations, partly to the writer's superior enterprise in visiting remote spots, and partly to her regrettable habit of dragging in irrelevant information. Thus, a history of English religious drama is inserted into an account of marionettes at Palermo, and an audience of Pius X. is described in connection with a journey to Piana dei Greci. This journey also illustrates another point of difference between Mrs. Tweedie and Mr. Paton. The former, as in many other instances, dwells with evident pleasure on the dangers of the expedition; the latter sets our uneasy minds at rest by referring to telephone communication between Piana dei Greci and Palermo. But perhaps the keynote of the divergence is struck in the first chapter of each book, reminding us of the *Punch* version of comments by Gladstone and Disraeli on each other's writings: "Hm, flippant." "Ha, prosy." If Mr. Paton is prosy, Mrs. Tweedie is certainly flippant, with a recklessly slipshod style, many inaccurate statements, and spelling that is peculiar either to her or to her printer. We need only instance "euphobia," "sandled feet," "Guidecca," "trigreliefs," the assertion that Segesta is in the northeast of the island, or that the prostrate Atlas at Girgenti is a woman; and the following strangely disjointed passage:

"Plato lived in Syracuse and became tutor to Dionysius the younger. He described those years in his Seventh Epistle, although Dr. Jowett declared all the Epistles were spurious. However, be that as it may, there is very little to see in the modern town."

With all its faults, the book is valuable as a sort of "chatty" Baedeker, being not only readable, but full of practical hints for the travellers who may be attracted by it to this wonderful island—"a land," as Mrs. Tweedie truly says, "of color, a land of variegated scene and endless charm."

Important New Macmillan Books
on Subjects of Economic Interest

JUST READY

Adams and Sumner's Labor Problems

By THOMAS SEWALL ADAMS, Ph.D., Assistant Professor of Political Economy in the University of Wisconsin, and HELEN L. SUMNER, Honorary Fellow in Political Economy in the University of Wisconsin.

Cloth, 12mo, 579 pp., $1.60 net (postage 13c.)

"The first satisfactory convenient collection of facts that will facilitate the study of the American labor problem. Contents: Book I. Woman and Child Labor; Immigration; The Sweating System; Poverty, Earnings and Unemployment. Book II. Strikes and Boycotts; Labour Organizations and Employers' Associations; The Agencies of Industrial Peace; Profit Sharing; Co-operation; Industrial Education; Labor Laws; The Material Progress of the Wage Earning Classes.

Professor Carver's The Distribution of Wealth

By THOMAS NIXON CARVER, Professor of Political Economy in Harvard University.

Cloth, 12mo, 290 pp., $1.50 net (postage 12c.)

"Professor Carver's analysis deserves the attention of the general reader as of the economist, for while primarily addressed to the latter, it is characterized by a lucidity and originality illuminating a subject constantly in the mind of the thinking public."
—*Outlook.*

Charles Franklin Dunbar's Economic Essays

Edited by O. M. W. SPRAGUE, Assistant Professor of Economics in Harvard University. Introduction by F. W. TAUSSIG, Henry Lee Professor of Economics in Harvard University.

Cloth, 8vo, 372 pp., $2.50 net (postage 21c.)

"It is peculiarly gratifying to come upon a volume of economic essays which avoids alike the Scylla of dismal dryness and the Charybdis of unintelligibility."—*Kansas City Star.*

Mr. Robert Hunter's Poverty *New Edition*

Contains the notable discussion of the conditions of child life in New York City which aroused such vigorous feeling recently. *Cloth, 12mo, $1.50 net (postage 12c.)*

"The most telling facts that he presents are facts drawn, not from official reports, but from actual experience and observation. As a record of such data, his book is an extremely valuable contribution to sociology."—*Review of Reviews.*

Dr. Devine's The Principles of Relief

By EDWARD THOMAS DEVINE, General Secretary of the New York Charity Organization Society.

Cloth, 498 pp., 12mo, $2.00 net (postage 13c.)

"Such a book has been greatly needed and will be of great value to all who study the vital issues under discussion."
—Asst. Professor CARL KELSEY, *University of Pa.*

Early Western Travels

1748-1846

A SERIES OF ANNOTATED REPRINTS of some of the best and rarest contemporary volumes of travel, descriptive of the Aborigines and Social and Economic Conditions in the Middle and Far West, during the Period of Early American Settlement.

Edited with Historical, Geographical, Ethnological, and Bibliographical Notes, and Introductions and Index, by

REUBEN GOLD THWAITES, LL.D.

With facsimiles of the original title-pages, maps, portraits, views, etc. Each volume, large 8vo, cloth, uncut, gilt tops. Price $4.00 net per volume (except the Atlas, which is $15.00 net). The edition is limited to 750 complete sets, each numbered and signed; but in addition thereto, a limited number of the volumes will be sold separately.

An Elaborate Analytical Index to the Whole

Almost all of the rare originals are without indexes. In the present reprint series, this immense mass of historical data will be made accessible through one exhaustive analytical index, to occupy the concluding volume.

"A stately series of reprints—typographically very open and handsome."—*New York Evening Post.*

"Of the editing itself one needs but to say that it is done by Dr. Thwaites, whose work with the 'Jesuit Relations,' the 'Wisconsin Historical Collections,' etc., has left him without a peer in the breadth of his scholarship and the vastness of his contributions. The editor's annotations make the present series worth possessing, even if one already owns the originals."
—*The Independent.*

Full descriptive circular and contents of the volumes mailed on application.

The Arthur H. Clark Company
Publishers, Cleveland, Ohio

Memoirs of Henry Villard

Journalist and Financier

1835-1900

Two volumes, with Portraits and Maps.

$5.00 *net*. Postage, 35 cents.

An autobiographical record of the varied and romantic career of the war journalist who subsequently became a power in the financial world, and carried the Northern Pacific Railroad to completion. Full of incident and valuable for its reminiscences of Lincoln and other prominent men of the time, as well as for its descriptions of important battles of the Civil War.

"A book of extraordinary interest. It is written with great ability, in a clear and flowing style; it details with perfect candor the incidents of a great career; it is an admirable report of great events, all of which the writer saw, and a large part of which (after 1870) he was; it exhibits the rise and growth of a rich and powerful personality and a character at once remarkable for its simplicity and its variety."—JOHN WHITE CHADWICK, in the *New York Times* Saturday Review.

"This posthumous autobiography of the late Henry Villard is a work of exceptional interest."—*Commercial and Financial Chronicle*, November 12, 1904.

Books Dealing With Timely Subjects

Among the important and all-absorbing public questions of the day are the public control of railroads and other corporations; charities, forestry, and irrigation. These and other timely topics will be found fully and authoritatively treated in the following books.

American Charities

A Study in Philanthropy and Economics. By AMOS G. WARNER, Ph.D., of Leland Stanford Jr. University. 12mo, $1.75.

"*Thoroughly practical.*"—New York Herald.

Economics of Forestry

By B. E. FERNOW, former director, N. Y. State College of Forestry. 12mo. By mail, $1.65.

"*No authority better known.*"
—Engineering News.

Irrigation

By FREDERICK H. NEWELL, Chief Hydrographer, United States Geological Survey. Profusely illustrated. 12mo. By mail $2.20.

"Ought to be read by everybody."
—*Literary World.*

Municipal Monopolies

Edited by E. W. BEMIS. 12mo. $2.00.

"A thought compelling volume."
—*Boston Journal.*

Punishment and Reformation

By F. H. WINES, LL.D. 12mo. $1.75.

"One of the notable and able books."
—*Cleveland World.*

Social Theory

A Grouping of Social Facts and Principles. By JOHN BASCOM of Williams College. 12mo, $1.75.

"No work so adequately groups the leading facts."—*Hartford Post.*

Socialism and Social Reform

By RICHARD T. ELY. 12mo, $1.50.

"Here for the first time is a full and accurate account of Socialism."—*Chicago Times.*

State Railroad Control

By FRANK H. DIXON, Ph.D., University of Michigan. 12mo, $1.75.

"A most valuable contribution."
—*Railway Age*

Taxation in American States and Cities

By RICHARD T. ELY. 12mo, $1.85.

"Full of interesting facts."
—*Rochester Herald.*

The Wealth of Nations

By ADAM SMITH. Condensed edition with preface and introductions by HECTOR MACPHERSON. 12mo. By mail, $1.10.

"An admirable edition of a famous book."

A complete list of titles in our LIBRARY OF ECONOMICS AND POLITICS *will be sent on application*

THOMAS Y. CROWELL & CO. 426-8 West Broadway New York

AN EDUCATIONAL DIRECTORY

I.—The NATION stands alone in its field. It has a larger circulation than any other politico-literary journal published in this country, going to all the principal libraries and reading-rooms, and into thousands of families.

II.—The circulation is chiefly among the thinking and well-to-do classes—lawyers, physicians, bankers, and other professional men—and in the homes of cultivated people, where the education of children is a matter of careful consideration.

III.—The School List in the NATION has been a representative one for many years. It includes cards of most of the prominent educational institutions everywhere during the season of school advertising, and a considerable number are inserted in the paper throughout the year.

IV.—The rate is reasonable, and discounts are made on continuous insertions, of which most of the school advertisers avail themselves.

School advertisements are printed in a uniform typography, with the address in the first line, classification being made by States alphabetically, unless especially ordered displayed.

Advertising rates, 15 cents an agate line each insertion, with the following discounts: 5 per cent. on 4 insertions, 10 per cent. on 8 insertions, 12½ per cent. on 13 insertions, 15 per cent. on 26 insertions, 20 per cent. on 39 insertions, 25 per cent. on 52 insertions.

The NATION is sent free while advertisement continues.

Orders may be forwarded through any responsible advertising agency, or directly to

THE NATION, 206 to 210 Broadway, N. Y.

Now Ready *Cheap Edition*

OF A REMARKABLE BOOK

The Psalms in Human Life

By ROWLAND E. PROTHERO

8vo, cloth, $2.00 net. Postage 14 cents

The author has brought together here certain pages of history showing the tremendous influences the Psalms have had on the religious and political life of the nations.

In its expensive form ($3.50) the book has passed through five editions in England and America.

"Not merely a remarkable, but an impressive book."—*Standard.*

"One of the most invigorating, inspiriting, and comforting books which have appeared for many years."—*Daily Telegraph.*

E. P. DUTTON & COMPANY

31 West Twenty-third Street, New York

LONGMANS, GREEN, & CO.'S NEW BOOKS

The Unveiling of Lhasa

By EDMUND CANDLER

With 53 Illustrations from Sketches and Photographs by Members of the Expedition, and a Map. Demy 8vo. Price $5.00.

This volume contains a complete account of the recent Expedition to Tibet from start to finish. Mr. Candler was in India when the mission was formed, and joined it within forty-eight hours of obtaining permission to go. He was a witness of the final engagements and the entry into Lhasa, and stayed in Lhasa until the return of the expedition, making good use of his time there in collecting valuable and interesting information about the curious religious institutions of the sacred city.

Port Arthur

Three Months with the Besiegers

A Diurnal of Occurrents

By FREDERIC VILLIERS

With 35 Illustrations, 2 Facsimiles, and a Map. 8vo. $2.50 *net*. By mail, $2.64.

*** This book is illustrated from the Author's original sketches and Photographs, depicting his experiences with General Baron Nogi's army before the great fortress. It will deal with all the vicissitudes of the indomitable besiegers, the Author having been an eyewitness of the fighting night and day.

NEW AND CHEAPER EDITION

The American Revolution

By the Rt. Hon. SIR GEORGE OTTO TREVELYAN, Bart.

New and Cheaper Edition, with Photogravure portrait of the Author. Vols. I., II., III. Crown 8vo, cloth, gilt top. Each volume, $2.00 *net*. Postage or Expressage extra.

*** Volume I. of this Edition, which was issued as Part I. of the original Edition, has been largely rearranged, carefully revised, and in part rewritten.

The Evolution Theory

By DR. AUGUST WEISMANN, Professor of Zoölogy in the University of Freiburg. Translated by J. ARTHUR THOMSON, Regius Professor of Natural History in the University of Aberdeen, and MARGARET THOMSON.

Two volumes, royal 8vo, 841 pages. With 3 colored plates and 131 other illustrations. $8.50 *net* Expressage extra.

The importance of this work is twofold. In the first place it sums up the teaching of one of Darwin's greatest successors, who has been for many years a leader in biological progress. As Professor Weismann has from time to time during the last quarter of a century frankly altered some of his positions, this deliberate summing up of his mature conclusions is very valuable. In the second place, as the volumes discuss all the chief problems of organic evolution, they form a trustworthy guide to the whole subject, and may be regarded as furnishing what is much needed, a Text-book of Evolution Theory. The book takes the form of lectures, which are so graduated that no one who follows their course can fail to understand the most abstruse chapters. The translation has been revised by the author.

LONGMANS, GREEN, & CO., 93 Fifth Avenue, New York

The Nation.

NEW YORK, THURSDAY, FEBRUARY 16, 1905.

The Week.

Mr. Roosevelt fittingiy took up the negro question in his Lincoln Day speech before the Republican Club of this city. This organization, like the Union League Club, has manifested a deep and sincere interest in the political welfare of the race which Lincoln freed. It has gone so far as to urge the punishment of the South for disfranchising the negro, by the reduction of its representation in Congress and in the Electoral College. Upon this point Mr. Roosevelt did not touch, but he pleaded vigorously and earnestly for that fair play for the colored man which is so essential to the welfare of both whites and blacks. "The only safe principle," he well said, "upon which Americans can act is that of 'all men up,' not that of 'some men down.'" It has been known since his election that he hoped to gain the South's affection, and there has been no little anxiety among the colored people and their sympathizers as to precisely the form the wooing was to take. In this his first public utterance on the subject since his great triumph, Mr. Roosevelt displays wisdom and tact, yet sticks to his guns. While noting with satisfaction the recent decrease in lynchings, he does not fail to give heartiest acknowledgments to "the ministers, the judges and law officers, the grand juries, the public men, and the great daily newspapers in the South," to whom the credit for this renaissance of law and order is largely due. Mr. Roosevelt was fortunate in being able to reinforce his own opinions by quoting those of Bishop Strange of North Carolina.

It cannot fairly be said that the lawyers of the Senate Judiciary Committee have "made short work" of the President's constructive-recess theory, for they took twelve months and ten days to make up their minds, and have not yet put in a report. But they have at least taken no stock in the notion that between twelve o'clock and twelve o'clock on December 7, 1903, there was an interval within which vacancies could occur and be filled under the recess-appointment clause of the Constitution. It is not to be supposed that the Senate's action at this late date will have any effect on the fortunes of Gen. Wood, Collector Crum, and the hundred or more other "recess" appointees. No decision by the Comptroller has ever been made public regarding the Major-General's pay for Gen. Wood during the months that elapsed between his "recess" commission and his final confirmation by the Senate, and he presumably received it, under Secretary Shaw's interpretation of the law, as "de facto" major-general. As for Dr. Crum, he was not receiving pay at the time, on account of another rule, so his status did not affect the Treasury balance at all. But the Judiciary Committee's decision will probably be regarded as a declaration of the Senate's position regarding any future situation of the same kind.

President Roosevelt is represented as "greatly disturbed" at the use which "the railroad interests" are making of Mr. Paul Morton's presence in the Cabinet. The latter's connection with the Atchison rebates is artfully made "a weapon" in the hands of those who are criticising or antagonizing the President's railroad policy. Yes, but why? Only because there is a necessary absurdity in starting out on a resounding campaign against rebates, with a giver and defender of rebates as your chief of staff. The escape from the embarrassment is easy. Any Secretary who thus hampers a President is, in delicacy, bound to resign; and, if he does not, may be removed without any delicacy at all. With singular unanimity, the press has been pointing out to Mr. Morton his fine opportunity to do the President a great service by serving him no longer. If he does not take the hint, Mr. Roosevelt should.

For the investigation of the illegal rebates by the Atchison, Topeka, and Santa Fé Railroad, two Democrats have been engaged by the Department of Justice—Judson Harmon, Attorney-General of the United States in the second Cleveland Administration, and Frederick N. Judson of the St. Louis bar. They are authorized to probe the matter to the bottom, and, if the evidence warrant, to institute criminal proceedings. With a Congressional committee gathering—as a basis for legislation—facts about rebates, discriminations, and other abuses of the public, and with Messrs. Harmon and Judson prodding the Santa Fé, the coming spring and summer will be uncommonly lively for railway managers. All this energy will be well expended if we succeed in discovering just what may be accomplished under existing laws. In choosing prosecuting lawyers whose standing and political faith are guarantee against any whitewashing of eminent Republicans, the Administration has done all that its most exacting critic could demand.

Several long-expected transfers in high diplomatic posts, to take effect on March 4, will result in the retirement of Laurence Townsend, the present minister to Belgium. Whether this is voluntary or involuntary, it is to be regretted. Mr. Townsend fitted himself for a diplomatic career by six years of study in Europe of languages, history, and international law. He was appointed secretary of legation in Vienna in 1893, was promoted to be Minister to Portugal in 1897, and was transferred to Belgium on April 15, 1899. Now, after twelve years, just when he should be of great usefulness by reason of his experience, he is to be displaced by Henry L. Wilson, who has been Minister to Chili since 1897. It seems to be an established rule that our ministers to Russia shall be changed frequently, and Mr. Roosevelt apparently thinks the present crisis a good time to put in a new man. George V. L. Meyer is to take charge of our affairs when all Russia is up in arms, yet he has been in our diplomatic service only since 1900. Mr. Henry White's long-promised promotion from first secretary at London to ambassador to Italy, in succession to Mr. Meyer, has been earned by eighteen years of service at the Court of St. James and in Vienna. All in all, the diplomatic service has perhaps a greater proportion of experienced men to-day than ever before. This is largely owing to continued Republican successes, but also to the fact that more men of the type of Laurence Townsend and John W. Riddle, now at Cairo, are attracted to the work.

That the Administration has a muddle on its hands in San Domingo is the natural result of the methods pursued in that business. They had been a strange mixture of secrecy and advertisement, of audacious advance and timid retreat. The result is that nobody knows clearly what has been done or what is proposed. There are obviously some flat contradictions in the testimony of our fiscal agent, Judge Abbott, and Commander Dillingham. On the question of the actual money receipts at Puerto Plata, it ought to be possible to test the conflicting statements of the two by appeal to the books. Instead of that, Administration dispatches intimate that Judge Abbott is "hostile" to its plans. That may be, and yet he may be telling the truth. There is evidently room for a great deal of official frankness about the whole San Domingo mess.

Allowed to resign under grave charges, John Goodnow quits the consular service. His original appointment as consul-general at Shanghai was an open scandal. A delegation of clergymen and college professors from Minnesota waited upon President McKinley to protest against naming a notorious ill-liver

to an important office. But all was in vain, since Hanna had promised the place to this "original McKinley man." And as time went on, and Goodnow, who is a man of unquestioned native ability, was able to do good service, especially in the period of the Boxer troubles, the opponents of consular reform used to point to him as a living justification of the spoils system. "You see? One of the worst cases, as you call it, turns out well." But it did not. Goodnow acted after his kind. He was accused of the most serious irregularities, by responsible Americans in China, both business men and missionaries. Coming home indignantly to "vindicate" himself, he finds it convenient rather to resign. Presumably, he should have been removed in disgrace; though we may think ourselves well rid of him on any terms. So is the spoils system justified of its children.

The case of Senator Francis E. Warren of Wyoming and his son, who is both a student at Harvard and a clerk of the Senate Committee on Claims, demands a public explanation. To the Washington correspondent of the *Evening Post* Senator Warren said on Thursday, that if he began explaining these matters, he should have to explain them all, and he would not dignify them in that way. Friends of the Senator advance the interesting theory that, while the son is on the payroll, the money is really paid to the persons who do the work. This arrangement, we submit, is anything but businesslike. The names on the payroll should be those of the clerks themselves. Any other plan at once opens a clear path to fraud. The career of Justice Warren B. Hooker furnishes some striking examples of the results of juggling with payrolls. Justice Hooker's nephew, also a student, was nominally employed in the Fredonia post-office, but some one else did the work. Unfortunately, the substitute got but a small fraction of young Hooker's salary. There is no reason to shun publicity if the transaction be honest.

Senator John H. Mitchell of Oregon, who in his long public career has enjoyed a number of opportunities of exonerating himself, is now facing another. His law partner has turned state's evidence. One of the documents upon which Mitchell relied for defence was an agreement, presumably signed March 5, 1901, by which Mitchell was to share none of the returns from the land-office business of the firm. This compact, according to the confession of Tanner, was not signed till last December, after Mitchell's name had already become involved in the land scandals. There is also a long and interesting letter, in which Mitchell states to Tanner the facts as Mitchell wishes them to be understood and as Mitchell hopes Tanner will remember them. This epistle, like others famous in political history, contains several postscripts—the last one, "Burn this without fail." Mitchell is simply under indictment; he has not yet been tried and convicted. However pained he may be by these various disclosures, he can hardly be surprised that his tearful protestations of innocence are received with jeers.

The case of the member expelled last week from the Illinois Legislature illustrates a habit of such bodies. If a State Legislature existed in which integrity and public devotion flourished to the exclusion of all bad motives, and some malicious member should wantonly cast reflections on its fair fame, summary expulsion would be no more than his deserts. Therefore, legislatures anxious to retain a reputation for integrity and public devotion will deal harshly with every critic from the inside. This man, Mr. Comerford, delivered a lecture before the Illinois College of Law, in which he said some extremely disagreeable things about the conduct of the lawmaking bodies. His lecture was reported in the newspapers, and caused such a sensation that a legislative committee was appointed to investigate the charges. That committee now pronounces them unfounded, and the House has expelled their author. What meaning attaches to the word "unfounded" in Illinois, we do not know. The evidence, at least, came as near specification as this: Mr. Comerford charged that one member had attempted to bribe another with $200 to vote for a particular candidate for minority leader in the Democratic caucus. The member to whom the alleged offer was made confirmed the story, saying that he was asked to vote for a certain candidate, that his tempter then offered to bet $200 that the rival candidate would not be elected, and that, after refusing the proposal, he was asked to "name his price" and offered the choice of six desirable committees. Even the alleged briber admitted as much as the request for a vote and the offer of a bet. But the committee demanded legal proof of every assertion. The injudicious censor is perhaps right in his closing fling that "God Almighty Himself, if he came here, would have been prevented from getting evidence against a self-confessed thief."

It is not a bad sign that, all over the country, lists of members of the Legislature who refuse to accept railway passes are being printed. They are, in most cases, extremely short lists, but they are better than none at all. In Illinois there are six in the honorable roll. Two of these are Socialists, whose passes were returned for them by the State Central Committee of their party. By a strange chance, after the announcement that they would pay cash fares, they failed to arrive at Springfield until two days after those travelling on passes were on hand. The third of the anti-pass men is an Independent, and so jealous of his distinction that he does not even buy a ticket, but pays cash on the train and takes the conductor's receipt as documentary evidence of the purity of his motives. The Prohibitionist carries a 2,000-mile ticket for the same purpose. Still another of the sextet deserves mention because he was, in a way, the one sinner who repented. He wrote for passes after his election, like anybody else. On the way to Springfield, however, he noticed that several Circuit Court judges in the same car pulled out passes. Speculation as to how these favors might influence litigation led to the conclusion that the practice was as bad in the legislative as in the judicial department. On reaching Springfield, therefore, this member sent back his passes.

The Legislature of the State of Washington is preparing to pass a railroad commission bill this winter, though the Democratic campaign last fall on the railroad issue was not successful. The Portland *Oregonian*, a Republican paper in a neighboring State, remarks that the policy of the railroads themselves towards the commission has greatly changed within the past two years, and that they are now accepting the inevitable with a good grace. "The experience of every State that has tried the railroad-commission plan for remedying transportation evils has demonstrated that corporations get along quite peacefully with a commission, and there is no reason for assuming that there will be anything different in Washington." The region west of the Cascade Mountains is said to be reasonably satisfied with the situation as it is, since the railroads already give a cheap haul to market, but the farmers east of the range are confident that the commission will grant them rates which will compensate for the advantage of location enjoyed by their competitors. Just so in Wisconsin the aggrieved shippers feel sure that the commission to be created by La Follette's Legislature will prove their salvation, while those now favored affect the view that the commission could not in any case do less than approve the present schedules, which are themselves the essence of justice.

Both sides in the Colorado election investigation have contrived to bring out their salient points with uncommon neatness, not to say theatrical effect. The Republicans began by submitting ballot-box after ballot-box to handwriting experts, who then reported that so many ballots in each box were written by one person or by two persons. This was ex-

tremely simple and concrete, and permitted the Republican papers to keep standing a table of the crooked votes identified up to date. The Democrats have now hunted up individual voters and put them on the stand to identify as their own ballots taken from the pile marked "fraudulent" by the Republican experts. In one precinct, a Republican election judge swore that on all the genuine ballots cast, except three or four, he had placed his initials on the numbered flap and then sealed it down. The 138 ballots pronounced fraudulent were then unsealed and the Republican judge's initials were found on all but three or four. Of course, if the ballot were really secret, such demonstrations as these would be impossible. As it is, it is certainly an advantage to leave as little as possible to inference in the probing of the Denver frauds. If every Republican claim were established, Peabody would be entitled to the Governorship by a fair margin. Yet at least one Republican paper, the Pueblo *Chieftain*, is now conceding that, in spite of the manifest frauds, Adams had a legitimate plurality.

Bishop W. N. McVickar and the Episcopal clergymen of Rhode Island are exposing themselves to the just wrath of the politicians of that State. They are to meet in order to consider "the desirability of united action on the part of the clergy in political reform in Rhode Island." The men and newspapers controlled by Senator Nelson W. Aldrich, Marsden J. Perry, and Boss Charles R. Brayton will, we are confident, explain to these misguided Episcopalians that ministers have no business even to mention political reform. Bishop McVickar is old enough and experienced enough to know that the breaking of every one of the Ten Commandments in the interest of party is not a sin, but a "political method." The real business of the clergy is to preach feeble and innocuous sermons, to attend sewing circles, and to remain amiable nonentities; they are impertinent meddlers when they begin to talk about the bribery of voters, the manipulation of legislatures, the subsidizing of the press, and that perversion of public sentiment by which men like Aldrich and Perry gain wealth and power.

The scandals concerning the franchise for the Chicago freight tunnels bring up some of the peculiar phases of a great engineering work. Every writer who has described the wonderful system which forms a gridiron of tracks beneath the streets of the business section of Chicago, has made much of the fact that this work was done so quietly that the citizens themselves did not know what was going on, and no one was inconvenienced for a moment. This was not due, however, solely to regard for public comfort. The tunnels were originally constructed, as a matter of fact, under an ordinance which authorized the company to build conduits for a telephone system. It was some time before it became known that the "conduits" were being made big enough to run a box-car through them. One of the alleged unsavory episodes concerns a report which was made to the Council on the progress of the work. This report, instead of being entered as merely "filed," was put down as "approved," thus giving the impression that the work was being officially endorsed. Another matter to be investigated is the alleged connivance of officials in the company's stretching of the powers granted in the original franchise. Chicago was able in the end to undo the harm caused by the original mistake. It was discovered that, even with its tunnels completed, the company could not carry freight in them without special authority, and in the final franchise the public interests were well safeguarded. Under it the tunnels come into the city's possession automatically at the end of thirty years.

That the Kentucky courts would uphold the law forbidding the education of blacks and whites together at Berea College was expected. But an appeal lies to the Supreme Court of the United States, and, as it does not involve the question of negro suffrage, the judges may perhaps be inclined to pass upon the issue instead of dodging it. The statute involved is the meanest legislative product of Southern race prejudice which has come to public notice for a long time. There had been no troubles and no scandals at Berea, which had for half a century been pursuing its noble aim of educating both whites and blacks of the mountain districts of Kentucky without molestation by the Legislature until last year. Then this law was passed without any inquiry on the spot as to facts or conditions. Many of the members did not wish to vote for it, but did not dare oppose the demagogues who for the moment have the ear of a misled people. No reference was made, for instance, to the fact that a large part of the endowment, if not all of it, was contributed with the understanding that the income from it should be applied to the education of both races under the same roof.

Texas City is a place of 250 population, seven miles northwest of Galveston. The proposal to make it by act of Congress a sub-port of entry served as a text for the annual exposition of the present absurd and wasteful machinery for collecting our customs revenue, though this particular bill seems to have been unobjectionable. It is an expensive joke to maintain ports like Galena, Ill., where it cost last year $378.05 to collect 70 cents; St. Mary's, Ga., where $581.90 was spent and $2.44 collected; or Beaufort, N. C., where receipts and expenditures were $13.01 and $136.44 respectively. Prior to 1877 a similar condition prevailed with regard to the internal revenue. With about $110,000,000 of collections, there were 209 districts. Now, with more than twice that amount of revenue, there are only 66. No district shows expenses greater than one-third the receipts; and, for the country over, it costs less than two-thirds as much to collect a dollar of internal revenue as a dollar of customs. The House Appropriations Committee last year attempted to put through a measure reorganizing the customs service along similar lines, but it went out on a point of order. Indeed, there is bound to be a certain amount of opposition so long as it is possible for a Congressman to get some town in his district made a sub-port in the same fashion that he might get for it a new post-office.

With notable promptness, the Rouvier ministry has introduced a bill for the abolition of the Concordat. So far as the new measure may be judged from telegraphic abstracts, it is more conciliatory than M. Combes's similar project. About all of the late Premier's separation policy gathered an atmosphere of contention. It never seemed that he was merely seeking to separate Church and State; he had rather the air of avenging the quarrel concerning the bishops, of continuing the proscription of the Church schools, and especially of defying the Pope. The new separation bill is not very different in essentials from the old, but it is presented at least in an impartial spirit. It represents apparently an honest desire to secure, under the supremacy of the State, religious liberty and independence to all denominations. It punishes no one, but simply marks out a new policy. One may say in a word that the new bill corresponds to M. Rouvier's moderation. Naturally, the French Roman Catholics have been gradually preparing themselves for separation and the consequent cessation of the State subsidies to the secular clergy. The Comte d'Haussonville, in two notable articles in the *Figaro*, has pointed out that, by forming Church associations under the civil law, the parishes will put themselves virtually beyond the reach of Government interference. That they will be better off by claiming only the immunities of other associations of citizens, he believes firmly, and he is confident that the money withdrawn by the State will soon be contributed by the faithful. His elaborate argument confirms our view that the Church will lose rather little by separation. In fact, the more enlightened Catholics of France look forward to the ideal of a free and independent Church in a free and tolerant State.

THE DEAD TREATIES.

In estimating the work of the Senate in defeating, under the guise of ratifying, the arbitration treaties, one must distinguish between form and substance, between act and animus. Technically, the Senate's excuse comes down to the assertion that there can be no general legislation by treaty. Each case must be made the subject of a special act. This is much as if there could be no comprehensive law against forgery, but that Forger John Doe and Forger Richard Roe must each be provided for by separate statute. What the arbitration treaties undertook to do was to specify the main classes of international differences which it should be our policy and purpose to submit to arbitration. Such general notions, however, were alleged by the Senate to be above its mental capacity. An individual controversy it could understand, but controversies as a class were too much for it. Hence each one must be laid separately before its godlike reason. That, in effect, is the ostensible explanation of the Senate's action.

We do not question the honesty or intelligence of some of the Senators who voted to amend the treaties. They had a legal and Constitutional scruple. But why may not a treaty be made the supreme law of the land when covering many details, and laying down broad principles, as well as when concerned with merely a particular instance? The arbitration treaties proposed (1) to express a strong preference for arbitration as against war, and (2) to set forth, in the most general terms, and reserving the amplest discretion, the classes of international difference which might be referred to arbitrators under a special "agreement." But no, said the Senate; it must be "treaty," not "agreement." We think the President rightly describes this amendment as a step backwards. Its legal justification seems to us exceedingly fine-spun, while the real motive for the Senate's action glares out of all its pretences.

It is a sorrowful thing, but the evidence is pretty clear that the Senate does not want, and does not mean to have, an effective arbitration treaty with Great Britain. It is with that country that the pinch comes. About the other treaties, the Irish societies in this country which have been besieging the Senate, openly and secretly, did not care a straw; it was only the English treaty they were determined should never be ratified in a form really promising efficiency. And its nullification has been accomplished by the same method—assassin amendment—that was used to do to death the original Olney-Pauncefote treaty of arbitration. In spite of the appeals of both President Cleveland and President McKinley, notwithstanding the petitions of merchants and educators and clergymen by the thousand, the trick was done by Lodge and other tools of the Clan-na-Gael. Similarly, this year, the word had gone forth that a working treaty of arbitration with England was not to be permitted. It was to be killed, if not openly, then by indirection. The Senate fumbled for a long time, discussing one murderous amendment after another. Finally, when it knew of the President's determination to abandon the treaties if the word "treaty" was substituted for "agreement," it rushed with suspicious alacrity to make that substitution. The treaties were to be beaten by hook or by crook; they have been by crook.

But while we think the course of the Senate has been mistaken and most unfortunate, we admit that there was provocation. It was given by President Roosevelt himself. By the cool audacity and lawlessness of his first proposals respecting San Domingo, followed up as they have been by a lamentable amount of shuffling and lack of frankness, he at once alarmed his friends and gave his foes, and the foes of arbitration, a handle. In vain did he plead, after it was too late, that the Executive would exercise his discretion wisely and lawfully. The San Domingo spectre was there on the horizon, to show what kind of "agreement'" Mr. Roosevelt was capable of contemplating. Thus it was his own headlong folly that gave the enemies of arbitration their great chance to strike.

We are bound to say, also, that the Senate appears to have realized, better than the President does himself, the deep inconsistency between his praise of war, together with his eager preparation for it, and his advocacy of arbitration. Senators accept his furibund talk about "the strong man armed"; they simply smile at him when he coos of peace. Mr. Roosevelt should not have expected that his chickens would not come home to roost. Probably no man of his time has done more to spread abroad the idea that arbitration is the resort of the weakling and the coward. As for amending good treaties to death, people have not forgotten how he, when Governor of New York, rudely denounced the first Hay-Pauncefote treaty as a surrender, and publicly expressed the hope that it would be rejected if not radically altered. A man cannot have talked for years as Theodore Roosevelt has done, acted as he has acted, and then suddenly pose as the grieved apostle of peace, without our special wonder.

The Senate's amendment destroyed the vital principle of the arbitration treaties, as it was intended that it should. Yet so important do we think it that even a pious hope of peace should be breathed by the civilized nations, that we had sympathized with those disappointed friends of arbitration who desired to see something saved, if possible, out of the wreck of the treaties. But the State Department announces that the wreck is absolute.

A LEGISLATIVE GRIMACE.

The House of Representatives was not engaged on Thursday in passing a railroad rate bill so much as in making faces at the railroads. Both morally and legally, the effect would have been the same if the House had turned "Buster Brown" and nailed up on the front of the Speaker's desk: "Resolved, That we don't like railroads and wish we knew some way to bang 'em good." On all hands it was admitted that the proceedings were farcical. The merits of the bill were scarcely discussed. To pass it without looking into its effect or defects might help the President and hurt the railways, so passed it was; only a handful of members stopping to inquire whether the process would not hurt the House more than it possibly could the railroads.

Ill-considered and insincere legislation can redound to the prestige of no legislative body; and ill-considered and insincere the rate bill passed by the House certainly was. Chairman Hepburn made a tearful explanation of his part in framing it, which reads as if deliberately calculated to discredit the measure actually voted. That is to say, he showed how superior was the Hepburn bill, which the committee rejected, to the Townsend bill, which it accepted. In drafting his own bill, Mr. Hepburn had the advantage of drinking from the fountain of official inspiration, having freely and repeatedly consulted the President and the Attorney-General. Indeed, said the innocent or the designing Hepburn (it is hard to decide which to think him), the final form of his own bill came bodily, with the exception of two words, from the pen of Attorney-General Moody. Yet it was this carefully drawn measure which was set aside in favor of the crude Townsend bill. Take one comparison. The Hepburn bill (with Mr. Moody's *imprimatur*) carefully provided for legal review of the Interstate Commerce Commission's orders, and stipulated that "pending such review, if the court shall be of opinion that the order or requirement of the Commission is unreasonable or unlawful, it may suspend the same until the further order of the court." All of that was stricken out by the impetuous Townsend. It is a wonder that he and the committee did not adopt that beautiful proviso of the Davey bill defining the Commission's power to fix a "reasonable" rate—"Provided, That the Commission shall in no case have power to *raise* a rate." If it is unreasonably low, it has to stay low, reason or no reason.

It is not necessary, however, to discuss the bill in detail. It confessedly comes into this breathing world "scarce

half made up," as deformed and unfinished as Richard III. Even the President, at whose behest it was passed, says he is most anxious to have it "perfected." This is his way of complimenting the House. Any sort of ragged and limping measure is good enough for the Representatives; the real work of statesmen in shaping legislation will be done elsewhere. Yet the Republicans of the House seem to take this left-handed tribute as a special grace on President Roosevelt's part!

That the action of the House marks one step more in its legislative degradation, we think few sober men will deny. If it has become, not simply a deliberative body no longer, but a mere cat's-paw, a pliant convenience, a set of men without either ideas or a will of their own, docile before dictation from the outside, and resigned to the prospect of their work being torn to pieces elsewhere—why, we are further on in parliamentary decadence than any one had supposed. In effect, the House is selling to the Executive—and for a mess of pottage — one after another of its birthrights. To discuss, to control, to decide, to fix great policies in both outline and detail, was the ancient privilege of the House, but it is now surrendered with scarcely a protest. In the act, we see illustrated in this country a tendency which Lord Salisbury detected in English political life, according to a letter of his which Mr. Sidney Low has recently published in his book, 'The Governance of England.' Reading House of Representatives for House of Commons, the following would fit conditions at Washington with startling precision:

> "I think you reason quite soundly in showing that in respect to the larger issues the House of Commons is gradually losing its power between the Cabinet on the one side and the electorate on the other. The power which the Cabinet has of acting upon the various motives which guide members of Parliament is so great, that the majority is more and more becoming a blind machine."

When you add that the House in ceasing to be free ceases also to be sincere, you have come pretty near touching bottom. Yet insincerity was stamped all over its late action. Listlessly the members voted almost unanimously for a bill which all admitted to be at such loose ends that it would be a calamity were it to become law, and which nine out of ten hoped in their hearts the Senate would smother.

THE PROPOSED NEW STATES

The Senate's action on the Statehood bill on January 7 was notable both for the absence of partisanship and for the extent to which the terms of the bill were modified by roll calls. Practically, the measure was made new. The House plan was to dispose of all four of the existing Territories at once by grouping them into two States. The Senate's bill, while providing for the admission of only two States at present, is, in effect, a three-State plan, since Arizona, put on probation for a while, can hardly be denied Statehood ultimately.

The perplexity of Congress over the disposal of the four Territories has been only natural. It was thought best to deal with them all at the same time, and yet scarcely any statement could be made that would apply to all four. Oklahoma showed a larger rate of growth between the censuses of 1890 and 1900 than any State or Territory, and Indian Territory stood second, but New Mexico showed less growth proportionately than any Western State except Nevada. Indian Territory is more densely populated than Texas, and Oklahoma than Florida, California, the Dakotas, or a half-dozen other States, while New Mexico and Arizona are more sparsely settled than any except Nevada and Wyoming. Oklahoma and Indian Territory have as abundant rainfall as Minnesota or Nebraska, while in the list of Weather Bureau stations the lowest annual precipitation registered anywhere is in Arizona. Oklahoma is agricultural, Indian Territory has valuable coal and oil lands, Arizona and New Mexico gold and silver mines. In size, too, the diversity is manifest. Indian Territory is a little larger than South Carolina, a little smaller than Maine; Oklahoma is larger than Indiana, but smaller than Virginia; while Arizona includes as many square miles as Pennsylvania, Delaware, West Virginia, and Ohio combined, and into New Mexico could almost be packed the six New England States and New York besides.

Turning to the character of population, Oklahoma has a larger proportion of native whites of native parents than any State in the Union except West Virginia. Arizona is No. 43 on the list. Two-fifths of New Mexico's population is of Mexican descent. Arizona, strangely enough, has a percentage of half as many Indians again as Indian Territory itself. Only four States in the black belt have a larger proportion of illiteracy than New Mexico, while Oklahoma has less than Massachusetts. Finally, New Mexico has had an organized territorial government and a delegate in Congress for fifty-five years, while Indian Territory has never yet had either.

Any one of these Territories would like to come in as a State by itself, but, failing that, they did not agree as to the alternative. Arizona would rather remain a Territory than be consolidated with New Mexico, fearing that the Mexican element of the latter Territory would control a majority of seats in the joint Legislature. The other three are more inclined to accept half a loaf. Oklahoma, which has now the machinery of government, and would probably keep it, will be likely to gain by amalgamation with Indian Territory, though the tribal governments do not terminate until July, 1906.

The House has voted twice to admit Arizona, and seventeen times to admit New Mexico, while the Senate once voted for New Mexican Statehood, though the houses failed to agree on details. Action has been put off from year to year, until now Oklahoma has a larger population than any Territory ever had before at the time of admission; and even Arizona, the least of the four in population, had at the last census more people than had two-thirds of the States admitted in the past.

The two-State plan had the simple merit of disposing of all the arguments based on inadequacy of resources or of population. If one Territory was not good enough for Statehood, lump it with another. As it happens, this would in both cases have merely reunited Territories that were originally one. Arizona was separated from New Mexico in 1863 on the ground that the Territory was altogether too large for administrative purposes, while Oklahoma was carved from the old Indian Territory as late as 1890. One essential weakness of the two-State argument was pointed out in the debate by Senator McCumber. The union of New Mexico and Arizona was proposed on the ground that they were similar in natural resources, while the other merger was urged for the opposite reason that their resources were unlike and complementary. To avoid the chance of admitting another Nevada, the two-State advocates were willing to create another Texas.

It seems to us that the amendments which have resulted from the many conflicting opinions of individual Senators are on the whole wise. If Oklahoma stood by itself, there would be little reason for refusing immediate Statehood; but the case of Indian Territory is somewhat different, and united there is not the slightest doubt of their ability to become a State creditable in every way. As for the huge area on the southern border, it is hard to see why the reasons urged for its partition forty-odd years ago do not hold good to-day. The distance from corner to corner would be about equal to that from New York to Chicago. Litigation would be made expensive and administration difficult. With that proposal rejected, the question remaining was whether to keep Arizona waiting. Much is promised for the Territory; in fact, the testimony given before the Congressional committees showed notable progress since the last census was taken. But the best argument for postponement is found in the flat conflict of statements regarding the agricultural and mining possibilities of the State. It is argued on the one side that irrigation can make Arizona a garden spot, while the other side rejoins that some irrigation works already con-

structed have proved failures for lack of sufficient water. A few years ought to make possible at least an agreement as to the facts.

The Senate gave the measure an uncommonly full and fair discussion, and has much more reason to insist upon its contention than the House, which rushed it through wtih only the travesty of a debate.

TEMPERANCE IN GERMANY.

The simple five-line cable announcement that the German Emperor had given permission to his army officers to drink toasts in water, doubtless seemed of trivial importance to most American readers. It must, however, have created a sensation in Germany, where an officer wishing to be a total abstainer has found it practically impossible to live up to his principles. To drink the health of his majesty in anything else than champagne has hitherto been regarded as a mild form of leze-majesty. Few officers have had the courage, the character, and the position to face the criticism certain to follow an avowal of abstinence from alcoholic beverages. One of these is Field Marshal Count von Haeseler, recently retired, who was considered one of the most brilliant officers in the service, and certain of high command in the event of hostilities. He is, moreover, a warm friend of the Emperor, and his example may well have influenced his sovereign when the latter informed the Munich Society against the Misuse of Spirituous Liquors that "no compulsion exists to partake of toasts in alcoholic drink," and expressed the hope that this fact would receive wide publicity.

The officers of the Kaiser's army cannot be regarded as an aggregation of topers. Not even the sensational writers like Beyerlein, Bilse, and Von Baudissin have gone so far as this in their recent novels. But all of them have dwelt upon the fact that there was entirely too much drinking, particularly in the officers' casinos or clubs, and there has been a widespread belief that this evil, instead of decreasing, has grown worse, particularly in isolated garrisons and in the most fashionable and aristocratic regiments of the service. Everywhere the temptations besetting a young officer are enormous. He is expected to drink with every comrade at the first entertainment in which he participates, and is supposed to lag behind no one in conviviality at the regimental gathering known as the *Liebesmahl*, or regimental "feast of brotherhood," which has been the undoing of many an officer. A certain corps commander admitted last summer that his annual tour of inspection was a round of torture for him, since custom required every regiment to entertain him at an elaborate banquet, at which his subordinates were particularly anxious—for obvious reasons—to see that he reached a state of mellowness.

That there could be a temperance, or a moderation, society, of which the Emperor would take notice, would have seemed impossible twenty years ago. Still more incredible would have appeared a prophecy that within so short a time there would be a widespread agitation to curtail the use of beer and liquor. There were then voices crying in the wilderness, but the wilderness was very great, the voices few, and the echoes rare. Profssor Fick of Würzburg, who long preached the doctrine of abstinence, suffered severely because he, like Professor Bunge of Basel, dared to avow himself "ein Temperenzler." Before he died, in 1891, he lamented the fact that the cause had made no progress in his lifetime. But, just as he passed away, the day of propaganda and of progress was at hand. Curiously enough, it is the scientists who have led in the movement rather than social reformers, and, as one of our correspondents recently pointed out, it was in Heidelberg itself, the home of the beer-drinking student, famous for its giant tun, that the experiments of Professor Kraepelin, begun in 1892, supplied a variety of scientific arguments in favor of abstinence as opposed to moderate drinking. Professor Kraepelin and his assistants speedily became convinced that there was no increase in vigor and alertness through drinking. In the case of some typesetters it was "ascertained that when these men had drunk half a bottle of wine each, they were under the delusion of increased vigor and capacity for work, while they actually did inferior work. This disturbing influence was still quite distinct on the following day, so that a second day of abstinence was necessary to bring the men up again to their own standard of efficiency." Among the students, particularly among those studying medicine, there are flourishing abstinence societies which make the oldest inhabitants of Heidelberg rub their eyes in amazement.

As yet church and school are indifferent to this movement. There is nothing that corresponds with the notable agitation on behalf of temperance undertaken by the Catholic Church in this country. The women's clubs, whose growth has been as striking as in the case of our own, have, however, begun to take up this question in earnest. Manufacturers, too, are beginning to see by practical experience that workmen who are constantly steeped in alcohol suffer a loss of productive power. The difference between laborers in north and south Germany in this respect is noteworthy. The publisher of a prominent newspaper, who recently moved his establishment to Munich from Berlin, estimates that the difference is fully 25 per cent. in favor of the North Germans. His new workmen have their beer bottles by their side throughout the day, and their union has blocked every effort to prevent drinking during office hours. This employer calls the great beer breweries which have made Munich prosperous "the curse of South Germany." He is himself not an abstainer. Students of our own liquor problem who see in the habitual use of beer and light wines an antidote to whiskey and brandy drinking, evidently have something to learn from a study of conditions in Germany. They will be surprised to find an increasing number of societies working for temperance, particularly in Bremen and Hamburg, where the Good Templars have obtained a firm foothold. Moreover, the German movement has at last obtained a respectful hearing from the press, which will be all the more liberal-minded now that the Emperor has taken his stand in regard to temperance in the army.

CIRCULATING MUSEUMS.

The consular reports from Birmingham are probably not favorite reading with art lovers, so we are glad to call attention to Consul Halstead's recent letter on a loan exhibition for educational purchases, supplied by the South Kensington Museum to the local art school. The exhibition consists of both originals and reproductions, and is made up with a view to the industries centred at Birmingham. Thus, metal work, enamel, jewelry, wood-carving, wood-engraving, designing for book illustrations, manuscripts as examples both of calligraphy and of illumination, are put at the disposal of the Birmingham students for the season of 1905. The principle is that of the travelling libraries, which have proved so successful in this and other States. That is, the collection is relatively small, and adapted to local needs. We presume that, as in the case of our own State Library, the South Kensington Museum gladly entrusts such collections to any responsible custodian.

A similar relation exists very advantageously between the central museums and outlying institutions of France and Prussia. The pictures regularly bought for the Luxembourg Gallery are, after a time, assigned to the provincial museums of France. Prussian galleries outside of Berlin regularly receive deposits of the surplus of the royal collections. It is easy to see that there are many objects of art which, while below the standards of a great museum, may be delightful in themselves and instructive to the student of the history of art. Every museum also acquires many duplicates, which, though they may not be especially available for exchange, would be very welcome in a smaller institution. Naturally, there could be no question of circulating permanent and major exhibits. The Luxembourg, in sending Whistler's portrait of his mother to a London exhibition, displays a liberality

little likely to be imitated. But out of the minor possessions of any great museum many small educational collections could be made which might be sent about with the same profit now experienced in the case of library loans of books or art reproductions.

Details will readily fly to the mind of anybody familiar with museum management. The storeroom of any large institution would fit out an excellent little collection of canvases which, grouped historically, would quite adorn an up-country museum. At the Metropolitan Museum, for example, lack of space has relegated to the storeroom many pictures of great interest: a capital Goya and an extraordinary fruit piece attributed to Velasquez may be instanced. Would not these pictures be more useful at Worcester, Norwich, Buffalo, or any other town with its museum, than awaiting the completion of a new building at Central Park? Certain important branches of art lend themselves admirably to miniature representation. A case of medals and a packing-box of small bronzes, supplemented by photographs of monumental compositions, would make Renaissance sculpture more vivid to a community than a great collection of dull casts. Textiles, again, might easily be sent about, and could not fail to affect our own designing favorably. Metal work of all sorts is designated for such use, and certain forms of faïence—precisely those most applicable to our own manufactures—may be transported without great expense or risk of breakage.

We need hardly say that such travelling collections should be not only planned by the central museum, but so completely labelled or catalogued that the local director need assume only the responsibility of custody. The considerable work that this adds at headquarters is repaid by the certainty that a few objects carefully chosen and fully described may be of greater educational value than the confusingly large exhibits in great museums. On the other hand, the best skill is required in arranging and labelling such collections, and, in addition, a very unusual tact and sense of what the average person needs to know and can take in. In fact, to do a little work of this kind would be quite as profitable to the cloistered connoisseur as teaching is to the scientific investigator. Moreover, the good will a museum may gain by relations of this sort is by no means a negligible asset. It extends widely its circle of possible benefactors, and recruits the student class, upon which, in the last analysis, all museums depend.

To museologists of the old school, who are shocked at a hint of removal of an object from its consecrated position in the showcase, the idea of lending anything to anybody will seem rank heresy. But in this matter the museums must simply catch up with the libraries. That veteran Cantabridgian, Prof. J. E. B. Mayor, told gleefully at his recent jubilee how once, when an undergraduate, daring to break into the sacred precincts of the university library, he was at once and indignantly put out by the outraged librarian. To-day, the Cambridge Library extends its hospitality to all the world, and, on proper requisition, even lends books to other libraries. Finally, a public museum which circulates its treasures is only doing what private collectors have long done willingly. Ten years ago the art association of a small New England college freely drew upon the priceless Japanese paintings of a well-known Detroit amateur and the etchings of a New York collector whose Whistlers practically made up the entire print section of the memorial exhibition at Boston last year. Such instances are by no means uncommon, and to discerning museum directors they point the way to loans equally liberal, but more carefully devised and directly educational. Undoubtedly, the new director of the Metropolitan Museum, under whose care the South Kensington Museum has done good work of this nature, will, as time serves, build up such a department of museum extension. Nobody knows better than he that for any museum the worst possible motto is, "Neither a borrower nor a lender be." Notable borrowers in the past, we hope it will not be long before all our great museums become also generous and discriminating lenders.

COLLEGE TUITION FEES.

The Yale Divinity School will not, it is announced, establish a tuition fee. The faculty has declared that such a step would mean the reduction of one-half in the number of students. So far as the Divinity School is concerned, the matter is temporarily settled; but the discussion of fees in other departments of the University still goes on briskly. At Harvard some one raises the question at least once a year. Week before last, for example, the *Evening Post* published an account of the movement to secure a large additional endowment for the college proper—$2,500,000 is the minimum, and $10,000,000 is mentioned as the possible goal. If Harvard cannot get this money, so the argument is often put, the limited income may force the increase of tuition fees. In most other Eastern colleges and universities, the authorities, when casting about for means to make both ends meet, are seriously asking whether the students should not bear a larger share of the burden.

Education costs much more than it did twenty-five or even fifteen years ago. The days when Mark Hopkins on one end of a log and a boy on the other were a first-rate college in miniature have long since passed. The libraries and laboratories which must now be maintained, even in a relatively small college, eat up the income of a million or two. Books are expensive in themselves; and the men and machinery for cataloguing and making them instantly accessible to a thousand students during fourteen hours of the day are not to be had for nothing. Laboratories with the latest apparatus in chemistry, physics, and all the branches of engineering are in some ways yet more expensive; for while a large number of books are as useful to the student of literature to-day as they were two hundred years ago, the scientific apparatus of two decades ago is valuable chiefly as a curiosity. To keep pace with the strides of modern science would almost drain the purse of Fortunatus. There is not a college of standing in America that could not expend from $50,000 to $100,000 annually merely in keeping up the efficiency of libraries and laboratories; and the larger institutions, like Harvard, Yale, Columbia, and the Western State universities, need far more.

Sound instruction cannot be provided by wholesale at cut rates. The expansion of a college, while it may reduce certain per-capita expenses of physical maintenance and administration, ought not to affect profoundly the per-capita cost of teaching. In a few courses twenty pupils can be handled as easily as ten; but if there is to be anything like personal attention and guidance, the professor in charge of a large course must have a stout corps of assistants to follow with care the work of individuals, correct their reports, theses, and examination papers, spur the lagging, and help the ambitious. A large course not thus thoroughly manned speedily degenerates into a "snap"—an academic Botany Bay. Experience at Harvard and elsewhere abundantly shows that the proportion between students and teachers must be held pretty steady if a university is to be "an alma mater, knowing her children one by one, not a foundry or a mint or a treadmill."

Moreover, the professor should not be asked to give his services for the pleasure of doing good. While we cannot accept the view that college teachers are, as a class, in the submerged tenth, heroically upholding a tradition of culture for the benefit of a world which neglects and starves them, we are sure they should be better paid. An increase of salaries from a third to a half throughout the country would be nothing more than justice; and it might, by attracting stronger men, improve the average of breadth and virility in our faculties.

While the demands for money are thus growing more insistent, the rate of interest is always falling. Harvard received 7.82 per cent. on her investments in 1871-72 and only 4.77 in 1903-04; and

other college treasurers tell the same story. The relation between income from tuition fees and income from productive funds is exhibited in the following table which President Charles F. Thwing of Western Reserve University compiled for *Harper's Weekly* from the last report of the United States Commissioner of Education (1902):

Name.	Tuition fee in college.	Income usually from tuition fees.	Income from productive funds.
Hamilton College	$75	$14,000	$28,000
Hobart College	80	7,646	18,224
Colgate University.....	60	16,258	48,285
Cornell University.....100-125		285,284	407,113
Columbia University...	150	479,217	524,730
New York University..	100	152,995	50,438
University of Rochester	60	13,649	36,908
Union College.....	75	9,000	20.000
Syracuse University....	75	88,425	32,267

The figures from other States are similar. The student often contributes only from a third to a half of the money spent on his college training. The rest comes from the diminishing interest on productive funds.

As a matter of bare equity, he might be required to contribute more. If the lads who own automobiles and horses and who employ valets could be subject to a special levy—a tax on luxuries—the college and the boy as well might gain. A tax on laziness and incompetence is proposed by Prof. J. McKeen Cattell of Columbia in a recent issue of the *Popular Science Monthly*. He would have the students of lowest standing pay the highest fees. These suggestions, however, are more ingenious than practicable. A high fee would not disturb the rich, and, where there are many scholarships, it might not overload the ablest among those of narrow means. There is, however, grave danger of driving away the very persons who profit most by college. Neither Harvard nor Yale, for example, can afford to alienate any considerable number of those serious, hard-working, and intelligent undergraduates who come from what might be called "middle-class" families. They become the alumni of whom in later years the university is most proud. At this present moment they form the cleanest and most wholesome element in the body academic. It is their presence and favorable influence which make multi-millionaires, provided they be not also fools, willing to send their sons to college. Were a university by any stroke of malign fate to become in fact a "rich man's college," it would soon rank, as an educative force, with the New York Stock Exchange or the Waldorf-Astoria Hotel. For a college, as for a man, there is a possibility of gaining the world and losing one's soul.

MONUMENTS TO CRISPI.

FLORENCE, January 25, 1905.

"Blessed by his country, the mortal remains of Francesco Crispi enter the Temple of Glory January 12, 1905." (Inscription over the central door of San Domenico, the Sicilian Pantheon.)

In his biographical sketch of Crispi, insurgent, exile, revolutionist, and statesman, the late W. J. Stillman foretold that "Italy will build him a monument, and amongst those who will be most eager to decree it, will be those who most feared and assailed him when living." The first forecast has been fulfilled before the fourth anniversary of his death (August, 1901); the second partially. Two monuments were inaugurated in Palermo on the 12th instant, the fifty-seventh anniversary of the Sicilian Revolution of 1848. The one placed in the Pantheon, where Cardinal Celesia refused permission to inter him, is a purely Sicilian tribute, representing Crispi grasping the tricolored flag with the figure of Sicily; on one side a youth folded in the flag looking eagerly outwards, as seeking the new enemies who have yet to be conquered. The other monument, in bronze, eleven metres high, rises in the Piazza Francesco Crispi (formerly delle Croci). This represents the statesman, the minister of the monarchy elected by the plébiscites. The allegorical figures represent Monarchy clasping Sicily, who bears aloft the flag of Salemi, on which is inscribed, "Italy and Victor Emanuel: Garibaldi in his name Dictator." This was the first proclamation issued by Crispi's initiative the day after the landing of the Thousand at Marsala, so that, neither in the island nor on the continent should there be any doubt as to the programme of the Liberator. The other hand rests on the figure of continental Italy. On the base are inscribed the words, spoken in 1864, "Monarchy unites us," which, with the other words, "A Republic would disunite us," led to the sad rupture between Mazzini and his greatest unitarian apostle.

Thus clearly does the monument arise as a tribute of the monarchical conservatives, who, throughout four-fifths of Crispi's life, feared, hated, persecuted, and calumniated him with relentless, remorseless cruelty. If their fury abated during his last ministry, it was because the utter and universal chaos into which they had plunged the country after overthrowing him by their coalition cabal in 1891, clouded the brain of the statesman and rent the heart of the patriot, and led him actually to adopt their violent measures of repression and coercion, while their financial incompetence, resulting in a deficit of 177 millions, left him without a farthing to spend on remedial actions. And it is this coercionist period of his life that the conservatives began to illustrate and hold up as a model to Zanardelli and the young King, who realized that the Italians had suffered too much violence, injustice, and oppression to tolerate more from any one. Since the late election the conservatives have begun to realize that they may not always remain the predominant partner. More than one of their organs recall Crispi's resolute attitude, according all due liberty to the Church within its spiritual orbit, but never once allowing it to invade the province of the civil power. When he kept Parliament closed during the conclave of 1878, it was to prevent the Catholic world from interfering on the ground that "the Church was not free to exercise its lawful authority"; at the same time he warned the cardinals that, if they held the conclave outside of Italy, they would never be allowed to reënter the Vatican. While he permitted pilgrimages and jubilees, he also promoted the inauguration of the statue of Giordano Bruno, to accentuate the fact that the abolition of the temporal power signified the establishment of liberty of thought, of conscience, of discussion.

While the unextinguished rancor of the Republicans and the Socialists is intelligible, the rabid attacks of the Radicals are as disgraceful as they are inconsistent. Their chief organ, the *Secolo*, evokes anew all the old calumnies. That of bigamy was disproved by a judicial court, as his supposed marriage with Rosalie Montmasson in Malta was no marriage; hence, when he made the mother of his beloved daughter his wife by the civil law, he committed no illegality. Nor did he, as his calumniators assert, leave Rosalie "to pine in poverty and destitution," but provided for her during his lifetime, and left her 300 lire a month in his will. Nor did she ever sanction the efforts of his persecutors to blacken his name; refused from first to last to allow her name to be used, and, two months ago, surrounded by the chief survivors of the Thousand, she died, blessing her one and only love, regretting that, while in poverty she had been his guardian angel, in affluence she had become a thorn in his side, and, by her exactions, jealousies, and want of self-control, compelled him to choose between separation from her or total withdrawal from public life. As with Byron, Crispi's domestic misfortunes darkened his career. Even now his worshipped daughter, for whom all his sacrifices were made, has been compelled to obtain legal separation from Prince Linguaglossa, whom he chose as a husband, thinking thus to ensure her a happy future.

Of course, the Bank scandals are revived, and the Radicals, who have accepted the leadership of the chief offender, still designate Crispi as the "great public plunderer," though they cannot ignore the fact that the debts he had previously incurred or had allowed to be incurred were left unpaid during his ministry, and that when he died all his property was sequestrated by his creditors. Of course, they still accuse him of promoting and fomenting the African war, of precipitating the final disaster, but they have not a single proof to adduce. Mystery still shrouds the story. Baratieri was made the military scapegoat, but, after his acquittal by the military tribunal, he kept silence till his death, when all his papers were transferred to the State archives. Mr. Stillman affirms that King Humbert was alone to blame—that Crispi desired to retain Baratieri in Italy, and to send a general of higher rank in his stead; that the King refused, and urged on the aggressive war. There are many who look forward to the opening of Crispi's archives, sequestrated and sealed since August, 1901, to find confirmation of this; but they will assuredly be disappointed. The abnegation and devotion with which, in the name of Unity, he served the "kings of the plébiscites," will never be belied by any posthumous revelations.

Neither Republicans nor Socialists care for the reforms effected by Crispi, which the Radicals are bound to, but do not, respect. Hence their natural implacability, their scorn and derision of the "glorification of Crispi." But it is something gained

that, with the exception of his latest and worst policy, his life as revolutionist and statesman is being vindicated. He will yet stand as a model patriot, and the good done in his lifetime will survive him, while from one point of view much of the evil effected has been buried in his grave. No present or future statesman will ever dare again to attempt to coerce a whole people, in Italy at least; while the mobocracy also is learning that neither shall they gain aught by violence. J. W. M.

MARGUERITE DE VALOIS.

PARIS, January 27, 1905.

There are many Frenchmen who know about Marguerite de Valois, the youngest daughter of Henri II. and Catherine de Médicis, and the first wife of Henri IV., only what they have learned in the amusing novels of the elder Dumas. I remember that in my younger days, a student being examined for the degree of *bachelier ès lettres* gave some details concerning the times of the Valois. The examiner asked him where he had found them; he answered candidly, in Dumas's 'Trois Mousquetaires.' As he could not cite any better source of information, he did not get his degree. It was rather hard on him, and I could not help remembering him when I saw on the title-page of a volume which has just appeared, 'La Reine Margot.' It is a very serious historical work, but the author found it necessary to give the popular name to his heroine, the famous princess who played such an important part in her day.

It is no easy task to write an impartial history of a princess who lived in troubled times, and had as many enemies as she had friends. There is an historical school which collects documents without showing much criticism in the choice of them. There are lying documents which are only worthy of contempt. Nobody has been the subject of more mendacious and libellous pamphlets than the unfortunate Queen Marie-Antoinette. These are kept in our National Library, in a special section, which is familiarly called "L'Enfer," a true inferno of ignoble productions which are never to greet the eyes of the general public. Marguerite de Valois, the beautiful "Reine Margot," cannot be judged solely by the testimony of the pamphleteers of her time. No more ought she to be judged by the partial eulogies of such men as Brantôme. The famous Pierre de Bourdeille, Seigneur de Brantôme, has left us, in one of the volumes of his amusing memoirs, a series of contemporary "Lives of the Illustrious Dames of France." Longest of all these is the Life of Marguerite. Brantôme gives the most glowing description of her beauty, her gowns, her manners. His account of the life and actions of the Queen is not very detailed, but is marked by his usual liveliness, and still deserves to be read; it is very partial, and is inspired by a sort of blind admiration, in which we discover, however, a touch of skepticism and of *parti-pris*.

The court of the Valois was the most brilliant in Europe; but Catherine de Médicis gave her children the worst possible education. She was sensual and superstitious, and surrounded herself with Italian adventurers, who brought to the court all their vices, their debauchery, the habitual use of poison and of assassination, their belief in occult sciences and astrology, their homicidal perfumery. Catherine inspired the massacre of Saint Bartholomew; she probably hastened the death of Jeanne d'Albret. The marriage of Marguerite de Valois with Henry of Navarre, which was intended to be a reconciliation of the Protestants and Catholics, was a purely political union. Marguerite did not like Henry of Navarre: she, however, was not herself an accomplice in the Massacre of Saint Bartholomew.

"I have heard a princess say," writes Brantôme, "that she saved the life of her husband in the Massacre, for undoubtedly he was proscribed and marked on the red paper (as they say), because it was declared that the roots must be taken out, such as the King of Navarre, the Prince of Condé, the Admiral, and other great personages; but the Queen threw herself on her knees before King Charles, her brother, to beg of him the life of her lord and master. The King granted this to her with difficulty, though she was his good sister. I have been assured that she bore the Massacre very impatiently, and saved several men, and even a gentleman of Gascony (it seems to me his name was Lerac), who, wounded as he was, came and threw himself under her bed when she was in it; and the murderers having followed him as far as her door, she ordered them away; for she was never cruel, but very kind, after the fashion of the daughters of France."

Brantôme adds that the pique between her and her husband arose more from religion than from anything else; but there were many causes for it, and it was a fact that they allowed each other a great degree of liberty. Marguerite was for a time taken by her mother to the Court of Navarre, but her heart was in the Court of the Louvre and she returned to Paris. Negotiations ensued with regard to her between the King of France and the King of Navarre, and she was obliged to return to Nérac. After the death of the Duke d'Anjou, she quarrelled openly with her husband, declared for the League, which was hostile to Henry of Navarre, and took possession, in the name of the League, of the town of Agen. She was driven from it by a revolt, and took refuge at Carlat. She remained some time in Auvergne, and the Marquis of Canillac made her prisoner and conducted her as such to the Castle of Usson. She contrived to take possession of it, and from a prison made it a safe retreat for herself.

Marguerite wrote Memoirs, which are now very rare. If we knew of her only what she says, and what Brantôme and another panegyrist, Father Hilarion de Coste, say, we should have to place her very high and only to praise her qualities. The other documents which give us light upon her character are not so flattering. M. Charles Merki says, however, justly:

"We certainly cannot imagine that Queen Marguerite was exactly the princess vaunted by Brantôme; neither that she led in the castle of Usson the austere life which Father Hilarion de Coste speaks of. Concerning conjugal virtue and fidelity—which it would have been a merit in her to stand up for with a husband like Henri IV.—Marguerite de Valois had no puritanical ideas other than those of her time, or of the world in which she had grown up and lived. But we cannot forget that, after her marriage, she became an object of hatred to the Protestants; that she was singled out by the writers of anecdotes whom her beauty, her wit, and her manners excited; and that, after her death, she was dragged in the mud, for reasons of state.

A pamphlet appeared in Edinburgh in 1574, under the title 'Le Réveille-matin des Français et de leurs Voisins,' which contains scandalous allusions to Marguerite and her brother, Charles IX. The principal source, however, of the stories told about her is the 'Divorce Satyrique,' a book which had a very large circulation and which still enters into the collections of bibliophiles. It has been attributed to Agrippa d'Aubigné; it appears, but with some important reserves, in the "Œuvres Complètes" of this writer edited in 1877 by Reaume and De Caussade. It was for a long time circulated only in manuscript form. M. Charles Merki calls it "an ignoble pamphlet, unworthy of the author of the 'Tragiques' and of the 'Histoire Universelle'"; nevertheless, it was largely used by Bayle and by most of those who wrote on Queen Marguerite. The anonymous writer places in the mouth of Henri IV. himself the recital of the facts which rendered his divorce necessary, and gives an account of the lovers, real or supposed, of Marguerite de Valois, with many extraordinary details. We find in the long list, with some unknown names, that of the Duke de Guise, of her three brothers, of La Môle, of Bussy, of M. de Mayenne, of the Viscount de Turenne. It is in the 'Divorce Satyrique' that we find a saying, often cited, of Charles IX.'s at the time of the marriage of Marguerite to Henry of Navarre: "In giving my sister to the King of Navarre, I give her to all the Protestants of the kingdom."

Anything, says M. Merki, may be believed when it is a question of the Duke de Guise and the last of the Valois, "but we ought not to take *à la lettre* the affectionate terms which were used by the brother and sister, the Duke d'Alençon and Marguerite." Pibrac testifies: "Our mode of writing nowadays is full of excesses; nobody uses simply the word love—one adds always extremely, infinitely, passionately, and such things. No brother writes to a sister, no sister to a brother, no servant to his mistress, who by a common error and fashion does not allow himself to go to extremes in language of the time, and does not forsake the path of duty and, I may say, of honesty." The whole literature of the time of Ronsard and of the Pleiad is full of this affectation and exaggeration.

The accusations against Marguerite de Valois have a more serious foundation in the 'Histoire Générale' of Scipion Dupleix, which comprises a History of Henri IV. and a History of Louis XIII. Scipion Dupleix was a Gascon writer, who was allowed to enter society under the protection of Marguerite. When she established herself in Paris in 1605, she gave him the rank of *maître des requêtes* in her hôtel, and let him into the details of her private life. After her death, Dupleix became the follower of Richelieu, obtained the title of Historiographer of France, and in 1630 published his historical work, in which he speaks of his benefactor in the severest terms. Bassompierre justly accused him of ingratitude. Richelieu, in his memoirs, passed on Marguerite de Valois a judgment which has the real tone of history.

Marguerite will always remain a very complex character. "Much good may be said of her," writes M. Merki, "and much evil, for, if she had true qualities, she exposed herself to much criticism by care-

lessness, by the promptings of passion and contempt of opinion, by the conviction that her royal blood placed her above certain rules, and that she could allow herself anything." To the general public she will always remain the handsome Margot of the Court of Charles IX., who danced the *pavane* in the rooms of the Louvre with the young Duc d'Alençon; the humane princess who tried to save some of the victims of the Saint Bartholomew, and to whom, as we have seen, the King of Navarre probably owed his life.

Correspondence.

TWO NOTES ON SHAKSPEREAN SOURCES.

To the Editor of The Nation:

Sir: Any item connected with possible sources of Shakspere's plays has a certain ephemeral interest even if it be not of value to the scholar. Whether the two notes which follow have any real significance in the determination of such sources, I am unable now to say, but, not having seen attention called to the facts, I state them for what they are worth.

The plot of "Measure for Measure" is undoubtedly the same as that of Whetstone's play, "Promos and Cassandra" (1578), which, like the same author's prose version of the incident in his 'Heptameron of Civill Discourses' (1582), may have been derived from Giraldi Cinthio, who wrote a tragedy, "Epitia," and a *novella* ('Hecatommithi,' Dec. 8, Nov. 5), on this subject. But as Shakspere has called his heroine Isabella, instead of Cassandra, it is usually assumed that he took the name from that of the teller of the tale in the 'Heptameron.' Now Isabel, the heroine of Robert Greene's "Never Too Late" (1590), has a very similar adventure (Greene's Works, ed. Grosart, viii., 144, ff.). Deserted by her husband, she is tempted and threatened by Bernardo, one of the burgomasters of the city of Caerbranck, but successfully resists him. He then has her brought before the council, of which he is executive head, and accused of adultery by a false witness whom he has suborned. Isabel is condemned and sentenced, but the witness suddenly repents of his perjury and confesses, whereupon Signor Bernardo is heavily fined and deposed from office.

It may be merely a coincidence that the name of the heroines in both tales should be the same, and that the name Bernardo should be rather close to that of Barnardine, the dissolute prisoner of Shakspere's play. But it is perhaps more striking that an unusual word is employed by both writers in the same connection. Greene writes (*ibid.*, p. 153): "Although he [Bernardo] knewe she did rightly *refell* his follie, and partly perceiued her counsaile cooled the extreame of his desires, yet the feare of God was so farre from him, that he prosecuted his intent." Shakspere employs this word "refell" only once in his works, where Isabel tells the Duke:

> "How I persuaded, how I pray'd and kneel'd,
> How he *refell'd* me, and how I replied" (*M. for M.*, v., i., 93-4).

The second item referred to is even more trivial. It is well known that "The Taming of a Shrew," the anonymous play on which Shakspere based his comedy of similar title, was entered in the Stationers' Register May 2, 1594 (Arber's Trans., ii., 648). Now, on October 16 of the same year, Thos. Gosson and Joseph Hunte entered a ballad entitled "The Cooling of Curst Kate" (Arber's Trans., ii., 662). "Curst Katharine," "Kate the curst," and "Katharine the curst," are phrases familiar to us from Shakspere's play (i., ii., 128-9, and 184; ii., i., 187); but in a hasty examination of the older comedy I did not meet with any of them. Still, it is not a far cry from Kate the shrew to Kate the curst.

Robert Adger Law.

Harvard University, February 8, 1905.

Notes.

The Merrymount Press, Boston, will make for C. E. Goodspeed an exact reprint of 'The Bride,' "a hitherto unknown poem by Samuel Rowlands," from the supposedly unique copy in the Harvard College Library. Alfred Claghorn Potter, assistant librarian, supplies an introductory note. Of the 210 copies to be printed, 190 will be sold for the benefit of the College Library.

Fox, Duffield & Co. have nearly ready 'Old Masters and New,' essays in art criticism by Kenyon Cox, some twenty in all, collected from this artist's contributions to the *Nation* and other periodicals, and much revised and altered. Their range, in point of theme and view, is from the fifteenth century to the present day.

'Trees and Shrubs of Central Park,' by Louis Harman Peet (author of 'Trees and Shrubs of Prospect Park'), is now in the hands of the printer, and the author hopes to publish it early next April. On sixteen maps covering the Park two thousand trees and shrubs have been plotted. Explanatory tables and text descriptions accompany the maps, so that identification is easily effected.

We have received the illustrated prospectus and Part I., Volume I., of 'A History of English Furniture,' by Percy Macquoid (London: Lawrence & Bullen; New York: G. P. Putnam's Sons). The work is to be a very stately quarto or square small folio, and Part I., running to page 48, including three plates printed in color separate from the text, is one-twentieth of the whole work, whose nearly one thousand large illustrations will include sixty plates in color. Four volumes will be devoted respectively to four periods, entitled "The Age of Oak," "The Age of Walnut," "The Age of Mahogany," "The Composite Age." The color-plate examples are very carefully wrought and highly successful, made by some modern process, seemingly not chromolithography, and yet superior in its results to the "three-color process" as commonly displayed. The subjects are the carved oak credence belonging to Mr. Barry, "Sudbury's Hutch in St. James's Church, Louth, Lincolnshire," "Sir John Wynne's Buffet," and (in the prospectus) a very elaborate chest with dropping front, inlaid in the Dutch style and with wood of various colors. There is not very much text in what remains of the 48 pages. Evidently but little purely Gothic design exists among the furniture which Mr. Macquoid's patient investigations have brought to light. He seems to name the closing years of the fifteenth century as the epoch for the first half-dozen pieces, including Plate I.

The Burrows Bros. Co., Cleveland, begin their series of reprints of "Narratives of Captivities" with 'A Narrative of the Captivity of Nehemiah How in 1745-1747,' edited by Victor H. Paltsits from the copy in the Lenox Library (1748). Mr. Paltsits supplies a topographical and historical introduction, and, on the bibliographical side, has occasion to criticise the faulty editing of Drake's 'Indian Captivities' (1839), which contained the first reprint of How. The tale, it must be said, is not very juicy. We could have wished a better proportion observed between the type employed for this volume and the page. There is a full index, and a facsimile title-page.

A book so slender that even its pages are unnumbered has been made up on the basis of an undated manuscript scrap, an "impromptu reminiscence" purporting to have been read at a meeting of the New England Historic Genealogical Society in Boston—'Lafayette in Brooklyn, by Walt Whitman' (New York: George D. Smith). The French patriot laid the corner-stone of the Apprentices' Library in Brooklyn, on July 4, 1825. Among other children whom he lifted over the rough grounds to a safe place for viewing the spectacle, was Whitman, who recalls Lafayette as resembling S. F. B. Morse's portrait now in our New York City Hall. A heliotype of this painting is accordingly provided, along with one of Cox's well-known photographs of the poet, and a facsimile of part of the reminiscence. John Burroughs supplies a preface. The mechanical execution of this trifle is dainty, and will commend it to the collectors for whom the edition has been limited.

Another slight, and wholly unpretentious, volume, quickly read, is Dr. J. W. Winkley's 'John Brown the Hero: Personal Reminiscences' (Boston: J. H. West Co.). The author was one of Mr. F. B. Sanborn's informants in preparing the Life of Brown. He was a boy in Kansas in 1856 when brought in contact with the partisan leader. His well-written narrative is restrained and manifestly truthful. Aside from his impressions of Brown, Dr. Winkley has little of importance to relate, though he participated in the capture of a camp of Missourian invaders. His chief service was as a guide in trackless prairies, having what he calls a "psychic sense" for going to the place or object sought—not orientation exactly. He also beats hollow the marvel of wireless telegraphy by telling of a mirage disclosing the enemies' camp so that it could be examined with the glass for all essential particulars. He is now a follower of Tolstoy, and his admiration for Brown is tempered by his present belief in peaceful instrumentalities. Mr. Sanborn furnishes an introduction, and there are photographic plates—one of the Adair log-cabin where John Brown viewed the body of his son Frederick, cruelly slain by Border Ruffians.

Under the perplexing name of 'The Medici Balls,' the Charterhouse Press of New York sends forth a handsome book by Anna R. Sheldon and M. Moyca Newell, telling of "seven little journeys in Tuscany." The "journeys" comprise the Mugello, Prato, Chianti, Lucca, Pistoja, Brancoli, and Barga. A trip to each of these spots, with

Florence as a starting-point, is narrated in a chatty, discursive fashion, with a due amount of historical reminiscence and a vivid description of present conditions. The authors are well informed and appreciative, and their account will arouse envy in the hearts of countless lovers of Italy who are unable to go over the same road themselves. These may find, however, some consolation in the beautiful photogravures, over a hundred in number, which form the essential part of the volume. Landscapes, people, works of art, and especially buildings, are displayed in bewildering profusion and, for the most part, with good artistic effect; least successful are the reproductions of paintings. Clear, open type atones for the glossiness of the thick paper. There is an index and a full list of illustrations. For the benefit of the uninitiated it may be revealed that the "balls" of the title are those which constitute the Medici coat of arms, encountered by the travellers at every turn in their wanderings.

'Uganda's Katikiro in England' (London: Hutchinson & Co.) is a work absolutely unique in English literature. The *katikiro*, or prime minister, was sent to England in 1902 to represent his countrymen at the coronation, and his secretary, Ham Mukasa, on their return, wrote in his native language an account of what they saw and did, and published it in Uganda. At the request of friends in England who wished to know what were the impressions gained during the visit, it has been translated into English, and thus enables us to see how one born in the heart of savage Africa was affected by the wonders of civilization. It is characterized by a naïve simplicity which makes it exceedingly attractive as well as amusing. Again and again the writer says that the wonders he saw made him feel like a little child. Everything is described from the native point of view and compared with things familiar to his own people. For instance, "The great tube out of which the smoke [of the steamer] comes is as large or larger than the largest drum in Namirembe Cathedral." Organ pipes "are like the stem of a green banana." At Marseilles "they took us into a room which they called 'lifet.' They make a thing like the room in a house, and a man comes and turns a handle, and a great deal of water comes out, and when all the water is finished, the room goes up by itself." The Natural History Museum in London, to which they went on "a carriage of two stories which is called an omnibus," was especially interesting. "Any living thing that is not there has never been seen by an Englishman, or it would have been brought there, whether it were bird or creeping thing or precious stone; all things from all nations, whether white or black, were there. It was there that I saw the whale that swallowed the prophet Jonah, so that he should go to Nineveh." A biscuit factory in Reading is called "the stomack of England, because it feeds the whole land," and Cambridge is famous "because it teaches things that are much to be desired by all men on the earth, and though it is not as large as other cities, yet I call it 'the tutor of the world.'" The translator, the Rev. Ernest Millar, has wisely refrained from making many notes or correcting misstatements. Sir H. H. Johnston contributes an introduction, and there are several interesting portraits and characteristic scenes in Uganda.

The American Book Company publish (as an addition to the Williams & Rogers series) a handbook of 'Commercial Law,' by D. Curtis Gano; in the preparation of it the author has had the assistance of Samuel C. Williams. The objections to handbooks of this sort have often been stated, and are well known. They are law books only among business men, and are instructive in business only for lawyers. Nevertheless, they are so frequently met with that they are probably of greater use than critics suspect, as helps in teaching. The present author expresses the pious hope that his volume may guide his readers "to discern the ways that lead *from* litigation." The ground covered is very extensive, embracing contracts, sales, negotiable instruments, agency, bailment, partnership, corporations, insurance, real property, and even pleading and practice. The subjects have been arranged "in the order in which it is deemed advisable for the teacher to present them." Cases are cited with care, and, regarded as a text-book for instructors, Mr. Gano's volume will be found valuable. Possibly it may have a tendency to enable business men "to conduct their business dealings with an intelligent idea of their legal rights and limitations"; but this bright vision is clouded by the recollection of the Statute of Frauds and other obstacles.

The Providence Journal Company has published for private distribution a volume entitled 'Half a Century with the *Providence Journal:* Being a Record of the Events and Associates connected with the Past Fifty Years of the Life of Henry R. Davis, Secretary of the Company.' The book, as the title implies, serves the twofold purpose of expressing the appreciation of the editors for the lengthy service of a valued member of the staff, and furnishing a vehicle whereby many interesting events connected with the paper's growth for the past half century are related. In this latter field the exhibition of the paper's development from a party organ into an "independent" sheet, sketches of the editors, prominent staff-writers, contributors and correspondents, and accounts of the mechanical equipment and the methods of news-getting, make up a very readable survey. It is unfortunate that the book is not provided with an index.

The identification of the Alighieri house or houses in Florence has been a vexed problem for many years. We know that the family lived in the parish of S. Martino, and local tradition has pointed to some old buildings diagonally across the street from the church. In 1864 the Florentine authorities, wishing to corroborate the popular belief, appointed a commission to investigate the matter. This body presented, the next year, a long report, based on numerous ancient documents, accepting the traditional site. Although the members of the commission were not agreed, and their interpretation of the data seemed illogical, the report was generally received as authoritative, and was confirmed by an official manifesto in 1869. The whole mass of evidence has recently been scrutinized in detail by Giorgio Piranesi, who exposes the blunders of the commission in its translation of Latin deeds and its deductions from them, as well as its fundamentally erroneous idea of the Alighieri genealogy. According to him, the documents, rightly understood, far from substantiating the legendary claim, prove conclusively that the structures in question cannot have belonged to Dante or any member of his family. On the other hand, they afford some indication of a vanished Alighieri residence at the intersection of the Via de' Cimatori and the Via de' Magazzini, on the opposite side of S. Martino from the accepted location. As to the fate of Dante's own house, we have evidence that it was destroyed at the time of his banishment. Piranesi's researches, published last year in *L'Italia Moderna*, now appear, with plans and photogravures, in a dainty brochure entitled 'Le Case degli Alighieri' (Florence: Francesco Lumachi).

'Natur und Arbeit' is the title of a work, in two large volumes, by Prof. Alwin Oppel (Leipzig: Bibliographisches Institut; New York: S. Zickel), whose object is to give a history of human industry and a description of the present state of the productive and distributive activity of the human race. The author first reviews the natural wealth which nature offers to mankind; next traces from prehistoric times to the present day the gradual steps by which mankind, using this wealth and overcoming the natural obstacles placed in its way, has emerged from primitive barbarism and achieved civilization; and finally minutely exhibits the contemporary condition of agriculture, manufactures, and commerce in the various countries of the world. The book is a veritable encyclopædia of its subject, replete with facts and figures of all possible kinds, and illustrated with many maps and woodcuts, most of which are relevant to the subject-matter. The author has drawn for material on the most recent writers on history, archæology, science, geography, etc., and has brought together a mass of interesting information on an innumerable number of topics, ranging from an account of the domestic animals of the ancient Greeks and Romans to a modern establishment for turning out armor plate or the Chicago Union Stockyards. Merely to give a list of the subjects touched upon would occupy more space than is here available.

The recent International Geographic Congress is the subject of the opening paper in the *Annales de Géographie* for January. A summary of its general work is followed by a description of the excursion to the Rocky Mountains and Mexico, with plans and photographs. The writer, M. E. de Martonne, says that the European geographers all "felt in some way the rhythm of the American life, feverish and hurried, ignorant of the morrow, concentrating all its energies on the present. Contact with the American geographers has been particularly instructive." It seems to him curious, however, that "in this country of intense economic life, endowed by the Census Office with the most complete and most precious statistical material, human geography appeared to be ignored." Another product of the congress is an account of the internal commerce of this country by Prof. H. Hauser, which he introduces with the statement that the extreme variety of our prod-

ucts is the cause of "le protectionnisme yankee." The vegetation of Japan and its influence upon the life of the people are most appreciatively treated by M. Revon. Japan's wealth in this respect is extraordinary, for, without reckoning the mosses, lichens, etc., there are 2,743 species of trees and plants, including 168 species of forest trees. Naturally, the Japanese are a nation of vegetarians, and a man's wealth is shown by the kinds of wood which have been employed in the construction of his house, its furniture and decorations. Nor is it surprising that to the arts of painting and sculpture these nature lovers should add the arts of making a garden and a bouquet.

The Tercentenary of 'Don Quixote' was celebrated in London on January 25 by a special meeting of the British Academy, at which Mr. Fitzmaurice-Kelly read the paper. Among other things he said that "the internal evidence of the book showed that Cervantes began hesitatingly and tentatively, intending to write a comparatively short story. The existence of the accomplished Sancho Panza was an afterthought. The idea probably occurred to Cervantes just after penning the innkeeper's statement that knights were commonly attended by squires." As regards the influence of the story in our day he says: "It is certain that imperfect translations suggested the characters of Sam Weller, the cockney variant of Sancho Panza, and of Colonel Thomas Newcome." Mr. Bryce, referring to the fact that history, not literature, was a subject within the range of the Academy, justified the celebration by the fact that the book was "universal," and "from its pages was to be learnt more of history than by reading a dozen chronicles."

An international congress for chemistry and pharmacy will be held in connection with the international exposition in Louvain next year. The Belgian Government has already promised financial aid, and the Chemical and the National Pharmaceutical Associations are arranging for the Congress, which will meet at the end of July and will sit in eleven sections. The work has already been distributed, and savants from many lands will participate. Professor Gilkinet of Louvain is the chairman of the committee of arrangements.

In Germany the writings of President Roosevelt are finding many readers; his 'Conquest of the West' has been translated for some time, and recently two new volumes have appeared in German garb, the 'Jagdabenteuer eines Farmers,' and the 'Jagden in Amerikanischer Wildniss,' and are reported to be selling rapidly. General Lieutenant von Liebert, in a recent discussion of these works, declares that they are the product of a "grossdenkenden Vollmenschen," and finds in the American President a type of the kind of man represented in Emperor William II.

In university circles in Germany a new phase of the old problem of general versus technical training is attracting a good deal of attention, chiefly on account of a petition, signed by hundreds of students in the philosophical faculty in Berlin, asking for the establishment of a special examination at the end of four semesters, to be called a "Philosophicum." This examination, after the analogy of the Physicum in the medical faculty, is to be, for candidates for the position of teachers in the secondary schools, the conclusion of their general studies. The examination is to cover German, religion, philosophy, and pedagogics.

—The Catalogue of the Exhibition of Pewter at Clifford's Inn Hall, London, held last spring, compiled by H. J. L. Massé, shows marks of hasty preparation. References are constantly made to 'Pewter Plate,' by the same author, reviewed in these columns last April; in fact, the Catalogue may be considered a supplement to that work. With all its shortcomings, necessitating "addenda" and "corrigenda," and with an index leaving much to be desired, the Catalogue is still an addition to our scant knowledge of the subject of old pewter. The vessels described, with few though good illustrations, are mostly of English manufacture, enough of Continental make being noted to mark the difference between the plain surfaces and bold outlines of the former, and the more highly decorated foreign ware better suited to the silversmith's art. In accounting for this distinction, Mr. Massé asserts that "the English workmen, working as they did under definite restrictions and still more definite supervision, were obliged to draw the line at any downright imitation of goldsmiths' and silversmiths' work." He is especially severe on the "grotesque inanities and the intricate yet imbecile nothings" that have been produced of late years, in an attempt to revive the art; and the questions whether the revival of the art of the pewterer is likely to succeed, and whether the wares now being made are equal in quality and design to the work of the past, can be answered only by a careful study of such examples as those given by Mr. Massé. As director of this, the first exhibition of its kind, Mr. Massé had the coöperation of the Pewterers' Company and of the most prominent collectors in England. The last vessel on the list is one of the prison cups or beakers engraved with a nail by Baron von Trenck while in prison in Magdeburg, and dated 1763, the year of his release. The Catalogue is expensively made, with a consequently limited edition, and can be obtained solely of the compiler, whose address is No. 37 Mount Park Crescent, Ealing, W., London.

—A tale almost colloquially told, and packed with adjectives characteristic of the rhetoric of the stump, is Col. Charles T. O'Ferrall's 'Forty Years of Active Service' (Washington: The Neale Publishing Co.). An autobiography, it properly includes an extremely creditable post-bellum career that embraced legislative and judicial duties in Virginia and twelve years in Congress, and culminated in the governorship of the author's State. He had entered early and stayed late in the Virginia cavalry, and the reminiscences of those four years have the greatest interest, whether for the veteran or for the youth who dreams of war. Three times he was seriously wounded, once directly through the chest, almost cutting the heart, but he was so full of fight that after Lee's surrender he failed to reach Johnston and help carry on the war only because that general also surrendered while he was still on the way. Col. O'Ferrall evidently depends on his memory, and there are various minor discrepancies with the formal records; but in one important incident he traverses a generally accepted belief. Lieut. John R. Meigs, a highly accomplished officer of engineers, was killed about 8 P. M. October 3, 1864, on the road near Harrisonburg, in the valley. Gen. Sheridan reported it as a murder, and ordered all the houses within an area of five miles to be burned. This is known as "the burnt district" to this day. Col. O'Ferrall gives a circumstantial account of a famous scout of that region, Frank Shaver, who had volunteered in the cavalry at the first call and was occupied in scouting near his native scenes. On this occasion, having two men with him, he suddenly encountered a mounted officer and two men, and sharp pistol firing on both sides resulted in the immediate death of one of Shaver's men and of Lieut. Meigs, and in the capture of the two Union soldiers. If that is correct, it was hardly ordinary bushwhacking. The character of the act depends upon the status of the slayers. Were they regular and uniformed scouts or irregular and irresponsible guerrillas? They certainly have always been believed to be the latter.

—Geologists in this country will hail with pleasure the publication, in English translation, of Suess's monumental work, 'Das Antlitz der Erde.' Volume I., which in its original form dates back to 1885, has recently been issued from the Clarendon Press (New York: H. Frowde), and does full credit, in method and typography, to the German publication. The translation is ascribed to Hertha Sollas of Newnham College, under the direction of Prof. W. J. Sollas of Oxford University. It is, indeed, fortunate that the translation of so important a work should have fallen to competent hands, and the announcement of the early issue of Volume II., towards the end of the year, to be followed in 1906 by Volume III., and shortly afterwards by the concluding volume of text, practically ensures a proper rendering of the entire treatise. No work on geology since the days of Lyell's 'Principles' has exerted so profound an influence upon geological thought as has Suess's 'Antlitz der Erde,' and no one has mastered the broad geographical facts that are associated with the science of the earth, the world-concept, in a manner at all comparable with his presentation. However open to question may be some of the theories or hypotheses advanced in this cyclopædia of knowledge, however incomplete may be the evidence on some points that are presented, the luminous survey of the relations of our planet's dominant features must for many decades of geological inquiry be an inspiration to the rising investigator and the guiding star to his researches. Suess has given to geology very largely what Darwin gave to biology—the new perception and the new inquiry. In the Sollas translation the notes and references originally at the end of the respective chapters become footnotes in their proper places, and this may justly be considered an improvement. Here and there we notice the use of terms which differ from what have come to be the recognized forms in American geological literature, but which may recommend themselves as useful—and in some cases, perhaps, improved—variants. Seeing how many have been the discoveries in geological science since the publication, twenty years ago, of the first volume (to which

Professor Suess in a prefatory letter himself alludes), one might wish that the translator and editor had taken for their task, instead of the original German edition, the annotated and much later French edition of MM. Margerie and Bertrand. This would have supplied much new information of which the student is greatly in need.

—The American Baptist Publication Society, Philadelphia, publishes 'The Church Covenant Idea: Its Origin and Its Development,' by Champlin Burrage. The author's painful labor in amassing a large body of material does not seem to have been seconded by his ability to draw out from it any general conclusions of an impressive character. Altogether praiseworthy is his refusal to overwork the word "covenant" as it appears in the Bible as the germ of the covenant idea of the post-Reformation churches. More germinal appears to him the oaths taken by the early Christians and by Jewish "proselytes of the gate" to abstain from various immoralities. Indeed, whether or not there was any genetic relation between these early oaths and the later covenants, there was, in the earlier, distinct prefigurement of the later form, and this fact suggests the principal defect of Mr. Burrage's presentation. He has reproduced a great many covenants of the early Baptist and Congregational churches, but he is singularly blind to their most striking character, which is a negative one—their comparative freedom from dogmatic elements. They are, like the early Christian oaths, pledges of loyalty to standards of right living to a remarkable degree. Doubtless to some extent the dogmatic element was implicit in the assumption that the New Testament teachings were identical with the Westminster and other confessions of faith. The beginnings of the covenant idea are found among the German Anabaptists of the Reformation period. Mr. Burrage is very modest in the claim he makes for any Anabaptist roots of the Scotch covenants. These, culminating in the Solemn League and Covenant of 1643, were quite apart from the main course of the development of the covenant idea. They were all covenants to maintain a fixed order of belief and worship. Much prominence is given to Robert Browne, the English Independent, both with a view to depreciating his originality and emphasizing his systematizing skill. The reaction of American colonial covenants upon the mother country is made plain. The famous Half-Way covenant of the New England churches has that cursory treatment which its much threshing heretofore makes right. In conclusion, it is confessed that "the covenant idea has ceased almost entirely to have for us the great significance it had for the early New England colonists."

—Mr. Charles Francis Adams has expressed the opinion that the ideal historian of the future, having prepared for his *opus* by writing effective monographs, will finally give the public the residuum of all his studies and reflections in such directness and compactness of form as the public can manage to cope with. Mr. J. H. Rose, in his 'Napoleonic Studies' (Macmillan), follows a reverse process. Having already published his 'Life of Napoleon' in two modest but weighty volumes, he now offers the world a certain number of chips from his Napoleonic workshop. The chapters of this volume have already appeared in various magazines, but, as each one of them bears directly on some phase of the Emperor's career, they make up a fairly compact series of essays. Several of the subjects chosen are extremely attractive, as may be seen from the following titles: "Wordsworth, Schiller, Fichte, and the Idealist Revolt against Napoleon," "The Religious Belief of Napoleon," "Britain's Food Supply in the Napoleonic War," "The Prussian Coöperation at Waterloo," and "The Detention of Napoleon by Great Britain." Mr. Rose's essays are marked by the same wealth of information and carefulness of statement which appeared in his book. He does not dogmatize for the sake of amusing his readers by a sharp saying, and inclines to caution whenever he ventures to put forth a generalization. This quality of his style is well illustrated by his concluding remarks on Napoleon's religious views: "The probability would seem to be that he wavered between materialism and theism, inclining more and more to the latter belief as the years wore on, but never feeling for religion the keen interest that he always manifested for the arts of war and of government. Richly gifted as he was in all that pertained to the life of action, and by no means lacking in originality and taste in the spheres of philosophy and literature, his nature was singularly barren on the side of religion. His best certified utterances on this topic are those of the politician rather than the believer." Another very interesting paper relates to the Prussian coöperation at Waterloo. In former years, controversy on this subject has usually ranged itself around the value of the direct assistance that was afforded by Ziethen's corps, coming in on Wellington's left at the close of the battle. But at present the discussion tends more and more to hinge upon the character of such indirect assistance as was afforded by Bülow between 4:30 and 6:30 P. M. It is now clearly made out that the German attack on the village of Planchenoit involved the detachment from Napoleon's main army of 14,000 excellent troops, who, but for that, might have added decisive weight to the last charge of the Guard upon Wellington's right centre.

—A double memorial to Friedrich III., the second German Emperor, was made public on the 18th of last October in a bronze equestrian statue and the Kaiser Friedrich Museum. This is the second memorial to the present Emperor's father in the new Berlin. As to the externals of these monuments the art world expresses itself with some reserves, but does not go so far as a year ago, when the statue before the Brandenburg gate was styled generally "the white horror." The new memorials, like the Reichstag building, suffer from their situation. The latter can be approached only from behind, the new Museum only from the side; while, for the statue, though the horse is finely modelled, the only free view of it presents the back of a uniform and a horse's tail. Rudolf Maison was the sculptor, and Ihne, chief court architect, the designer of the building. The three-cornered plot of ground on which the Museum rests presented some difficulties, as it is on the Spree Island, and hemmed in by the city railroad on one side, and on the other two by the arms of the Spree; but Mr. Max Osborn, writing in *Die Nation*, thinks this fact should have called out more originality from the architects, and not driven them back on all the historic devices of late Renaissance. The interior arrangements, however, evoke more praise, and introduce some odd effects, rich in variety, demanded indeed by this same ground plan; and the director, Wilhelm Bode, and his assistant, Max Friedländer, by mingling art works of different sorts, paintings, sculptures and small works, in rooms where door frames, ceilings, cases, etc., have the decorative character of the period, have established model halls that will serve as types wherever such material may be had. So the Rubens room is a masterpiece, as a whole and in relative effects; and striking also are the hall for the Raphael Gobelins, the wall where Raphael's Madonnas add to each other's glories, the Titian hall, and the double room containing Botticelli's Madonnas, Signorelli's, and Mantegna's "Presentation in the Temple." Berlin has never known before what treasures it had in its old museum. Great praise is due to Director Bode for the collection. He has made Berlin's money flow out for art objects in an astonishing way, and kindled the joy of collectors no less. No one before him has had such skill. Of the new acquisitions one must mention the James Simon cabinet of Italian Renaissance art works of all kinds, the Adolf Thiem hall of Netherland masterpieces, and the Wesendonck gallery—the last at present a loan.

LOVE'S LABOR'S LOST.

Love's Labour's Lost: A New Variorum Edition of Shakspere, edited by Horace Howard Furness, M.A., (Harvard) Ph. D. Vol. XIV. Philadelphia: J. B. Lippincott Company. 1904.

Editing "Love's Labour's Lost" calls for noble fortitude. The editor, however enthusiastic he may be for his author, can hardly shake off altogether the dread lest both play and editor fall under the ban of the fatal letters three writ large. Such misgiving ought not to be. The play, though assuredly not of Shakspere's best, as assuredly is not of his worst. On the contrary, there is in it a peculiarly happy audacity, a half-consciousness of youthful power, which fascinate the reader able to penetrate the thin cloak of verbal conceit and piled-up rhyme and grotesque situation. This estimate we catch glimpses of in the remarks of William Winter, Dowden, Walter Pater, cited at pages 337, 362, 365. The true estimate has not yet been definitively formulated, though Moulton comes very near it in his 'Shakespeare as a Dramatic Artist' (third edition), a book, by the way, not in Dr. Furness's list of works quoted from. This is to be regretted, for Moulton's treatment of "Love's Labour's Lost" in parallel with "As You Like It" is illumining and helpful.

What is the theme—to use a much-abused phrase, the "central idea"—of the play? Usually the reader, tickled by the word-fence and the glitter of Armado and Holofernes, has erred to the extent of looking upon the play as a satire of Elizabethan foibles. This is to overlook Ben Jonson's truism, that Shakspere was not of an age. The theme of "Love's Labour's Lost" is

not the satire of an age, but satire for all time, the sharp yet kindly ridicule of pedantic, affected Celibacy turned to naught at the first brush with Reality. Can we imagine anything more absurd than the spectacle of four young "bloods" in the heyday of manly vigor forswearing everything but books and study for three mortal years? Put thus baldly the absurdity is palpable. So are the pound-of-flesh bargain and Lear's partition of his kingdom palpably absurd. But the dramatist's cunning hoodwinks us; it hoodwinked even the astute Biron into half-hearted assent. From now on we have the inevitable conflict. The King and his men are shams; the Princess and her ladies, quippish and snippish though they be, are not shams: life to them is healthful earnest. Shakspere intended to satirize, not the Renaissance nor the Elizabethan nor any period in particular, but the perennial folly of trying to withdraw from the world while remaining an integral part of it.

So much for the main theme. How is it with the minor groups of characters: Armado, Moth, Jaquenetta and Costard; Nathaniel, Holofernes and Dull? Here, if anywhere, we may look for local and contemporary hits. Jaquenetta, Costard, Dull appear and reappear on Shakspere's stage; though well drawn, they are types rather than individuals. With Armado and Holofernes the case is different. They are not types, they are not even individuals representative of classes; to our way of thinking they are thinly disguised portraits, drawn from originals more or less familiar to the well-informed playgoer of the day. At this point we part company with our editor, very reluctantly. Precisely who were the originals, we do not profess to have discovered; but that there were originals, we cannot help believing. At page eight Dr. Furness records his protest: "May I be permitted respectfully to say that I find it almost impossible to believe that an audience in Shakspeare's day, or in any other, could, while the play was in action before their eyes, piece together such fleeting allusions . . . and make therefrom specific characters." Dr. Furness seems to us to put the stage of 1900 in the place of the stage of 1600. Playgoers of the Bankside were not playgoers of Longacre; they did not go to the show as a relief from a day in stocks or town-shopping or from a heavy club dinner,

> "Und, was das Allerschlimmste bleibt,
> . . . vom Lesen der Journale."

To the Elizabethan the play was a mirror of the world, to show "the very age and body of the time his form and pressure;" the actors "are the abstract and brief chronicles of the time: after your death you were better have a bad epitaph than their ill report while you live." Shakspere, speaking through Hamlet, felt that much at least, however much more he may have felt which transcended the form and pressure of the time. We need not hold with Fleay that Holofernes is drawn from Bishop Cooper, we may put aside summarily the identification of Armado with Lyly as preposterous, yet we need not fear to admit that a quick-witted spectator of 1600 was able to make a good deal out of fleeting allusions—perhaps that was what he went to the play for. And if his knowledge or his divination failed, surely he might count upon a kind neighbor to pass him the word.

Fleay would identify Armado with Lyly, and we do not hesitate to dub the attempt preposterous. In general, altogether too many words have been wasted upon Lyly and Euphuism in Shakspere. Even our patient editor must have groaned more than once, we suspect, over his pages 348-350; we fancy we detect a sign of relief in his parting remark: "Possibly, the last word on Lyly and Euphuism has been said in an essay bearing this title, written by Clarence Griffin Child, . . . wherein Euphuism is subjected to a microscopic analysis which will probably suffice for all time." The defect of Child's essay is that it is too microscopic—it loses sight of the wood in the trees; besides, it has altogether too much of the infallibility air of the Munich school. Should any honest reader, bewildered in this world of words, ask what is this mysterious Euphuism, we would answer: the style of Lyly's "Euphues." And to the inevitable further question, what is the style of "Euphues," we would answer: Read, if not the 446 pages of Arber's reprint, any twenty or thirty pages of Landmann's little volume of selections; better still, read Lyly's "Campaspe" in Gayley's 'Representative English Comedies.' Having thus formed your own definite impression of the Euphuistic style, judge for yourself whether you can fit it into "Love's Labour's Lost," or anything else of Shakspere's.

Yet we should not reject all connection between Shakspere and Lyly. The younger dramatist, we suspect, learned a good deal from the elder in the line of brisk dialogue and sparkling repartee. To readers unfamiliar with the earlier drama, the point can scarcely be made clear without more discussion than we have space for. But of readers who are familiar with dramatic history we need only ask, Where in the drama before Shakspere do you find anything like brisk dialogue and repartee except in the writings of Lyly? Further, the grotesque contrast between Armado and Moth derives somewhat at least of its verve from "the lovely, loving pair of friends," Sir Thopas and Epi, in Lyly's "Endymion." True, the comic contrast of unwieldy pomposity with elfish pertness is very old on the English stage; we find it in the Cain and Garcio of the Towneley mysteries, in the Jupiter and Merry Report of Heywood's "Weather." But the extravagant love of Sir Thopas for Dipsas seems to have prompted the love of Armado for Jaquenetta.

There has been much cudgelling of wits over the date of composition of the play. All the thrusts and parries, reproofs valiant and counter-checks quarrelsome, are duly recorded in pages 324-341, with an obvious, if suppressed, editorial *non liquet*. We fancy Dr. Furness viewing the whole question, as he advises us to view the "lost" quarto, "with one auspicious and one dropping eye." We merely adventure a mild surprise that he should not have ruled out with a curt dictum every inference drawn from the date of *publication* of Sidney's 'Arcadia,' 1590 (see pp. 325, 330). The date of publication of the 'Arcadia' cannot possibly figure as a *terminus a quo*, for the sufficient reason that the 'Arcadia' circulated freely in manuscript several years before it was given to the public in print; it was a sort of Elizabethan 'Christabel.' In like manner 'The Defence of Poesie' was known and read long before its publication (1595). Consequently, Dr. Furness's argument that the 'Defence' could not have furnished any hints for our play is not valid. That it did furnish any is of course highly improbable.

"Love's Labour's Lost" is not the product of the dramatist's maturity; on that point all are agreed. Is it, on the other hand, a firstling, possibly *the* firstling? This seems to be the view of Hertzberg and even of Furnivall (pp. 333-335). The view rests in the main upon metrical criteria. Hertzberg figures out less than four and a half per cent. of feminine rhymes; Furnivall lays stress on the large number of doggerel lines and alternate rhymes: "The metrical facts are those which to me settle the earlierness of *L. L. L.* over the *Errors*." Since metrical facts are to determine priority, by all means let us have them, only let us test them in the concrete and not by rule of thumb. We put side by side a passage from "Love's Labour's Lost" and a passage from the "Errors." First from Biron's great speech:

> "From women's eyes this doctrine I derive;
> They are the ground, the books, the Academes,
> From whence doth spring the true Promethean fire.
> Why, universal plodding prisons up
> The nimble spirits in the arteries,
> As motion, and long-during action, tires
> The sinewy vigor of the traveller."

Now for the "Errors":

> "A league from Epidamnum had we sail'd,
> Before the always wind-obeying deep
> Gave any tragic instance of our harm.
> But longer did we not retain much hope;
> For what obscured light the heavens did grant,
> Did but convey unto our fearful minds
> A doubtful warrant of immediate death."

Surely this is no improvement upon Marlowe's

> "Holla, ye pampered Jades of Ásiá."

It has not even got beyond the stilted strut of "Gorboduc." Compared with such pedantic stuff, Biron's speech has almost the directness, the elemental spontaneity of Portia and Prospero.

A few words upon the play as a whole and its acting possibilities. Our readers may contrast the opinion of Gildon (p. 327), "—since it is one of the worst of Shakspeare's plays, nay, I think I may say the very worst," with Sidney Lee's statement (p. 346): " 'Love's Labour's Lost' was one of the most popular of Shakspeare's comedies on the Elizabethan stage for some years after its first production." The proof of a pudding, says the proverb, is in the eating thereof; the proof of a play is in the acting. Those of us who had the good fortune to see Daly's representation of "Love's Labour's Lost" in March, 1891, will not forget it. To the audience the performance was a revelation; from beginning to end there was not only wit and charm, there was "go." Armado became a solid reality; even Holofernes, one of the most difficult rôles in Shakspere, became irresistibly droll. The master-effort, however, was Biron's great speech,

> "Have at you, then, affection's men-at-arms."

Mr. George Clarke's sonorous, modulated voice, his exquisite emphasis, his clear conception and rendering of Biron's intense directness, were enough to carry away any audience. Such a performance ought to remove the last lingering suspicion of the playwright's juvenility.

The erudition packed away in the volume before us is incommensurable in terms of reviewing. Fortunately we are beyond the necessity of praising. We can only thank the editor for his untiring single-heartedness, for the lucidity with which he has disposed his huge material; above all, for the fine shrewd humor which lurks in every page. It is one thing to be steeped in lore, quite another to keep clear of extravagance.

THE TOWER OF PELÉE.

The Tower of Pelée: New Studies of the Great Volcano of Martinique. By Angelo Heilprin, F.R.G.S. Philadelphia: J. B. Lippincott Co. 1904.

Before the eruptions of 1902, the summit of Mont Pelée encircled a crateral pit about half a mile in diameter, which, like the Somma crater of Vesuvius at the dawn of the Christian era, was a rarely visited wilderness overgrown with vines and shrubs. At the bottom of this depression, from 1,000 to 2,000 feet below its dentate rim, lay the little basin known as L'Étang Sec, opening to the south, through a great V-shaped breach in the crater-wall, upon the city of St. Pierre, four miles away.

The first observers to ascend the mountain after the destruction of the city on May 8, 1902, found the former basin of L'Étang Sec occupied by what seemed to them a cone of lava blocks and lapilli, but which Professor Lacroix later showed to be a domical mass (*bourrelet*) of extremely viscous lava. The dome rose until, in July, 1902, it overtopped the rim of the ancient crater. About this time Dr. T. A. Jaggar, jr., noted a fin-like projection from the dome, with a height which he estimated at 200 feet. The structure aroused no great interest and was destroyed a few days later.

On the 15th of October, Professor Lacroix, from the brink of the crater, saw a dominant point or spine jutting from the jagged surface of the dome. This spine rose at the rate of twenty or thirty feet a day until, notwithstanding continued losses by disintegration, in March, 1903, it towered more than a thousand feet above the remains of Morne de la Croix, the highest point on the rim of the original crater. It has been estimated that, had no fragments fallen from this obelisk, it would have attained a height of 3,000 feet. The material of the spine was solid lava, thrust bodily from the throat of the volcano. Steam issued from the mass; and its rifted sides, whence fragments were continually falling with a clinking sound on the dome below, revealed glimpses of an incandescent interior. During the month of May the spine rapidly disintegrated, and in August, although the supporting dome continued to rise, the great pinnacle had crumbled away. It is this remarkable structure that Professor Heilprin has described as the "tower of Pelée." A second and smaller spine rose on September 8, 1903, but was destroyed nine days later.

Had the gorge of the Rivière Blanche not opened directly from the old crater, or L'Étang Sec, upon the city of St. Pierre, the eruptions of Mont Pelée, great as their interest to volcanists, might have attracted merely passing attention from the world at large. But the swift rush of the fatal cloud upon the scarcely awakened city, and the almost incredible destruction wrought in a few moments within its dark folds, converted what, in comparison with convulsions such as those of Krakatoa or Bandaisan, was a minor eruption, into a calamity so terrible as to move deeply the imagination and sympathy of the civilized world. It is in the wide and sympathetic interest stirred by the tragic fate of St. Pierre that Professor Heilprin's volume finds its justification. Its author is a man of versatile scientific attainment, a general naturalist and geographer rather than a geologist or volcanologist, and with the journalist's eye for effective (albeit not always essential or accurate) details. A thoroughly characteristic passage is that describing his first glimpse of the tower.

"Shortly before two o'clock the opportunity for which we had so impatiently waited seemed finally to arrive. Clouds and vapors died down to one side, and the great tower, its crown hanging at a dizzy height above, began to unfold. Piece by piece was added to it—purple, brown, and gray—until at last it stood abreast of us virtually uncovered from base to summit. 'Look!' I shouted to my companion, and my words failed me for the magnificence of the view that presented itself. The spectacle was one of overwhelming grandeur, and we stood for some moments awed and silent in the shadow of this most impressive of mountain forms. Nature's monument dedicated to the 30,000 dead who lay in the silent city below, it rose up a huge monolith, 830 feet above the newly constructed summit of the volcano, and 5,020 feet above the Caribbean surface—a unique and incomparable type in our planet's wonderland."

Professor Heilprin's hypothesis of the origin of the great spine is not that which finds most acceptance among geologists. He maintains that the tower is the ancient solidified core or stopper of the volcano, which has been loosened from its resting-place and upheaved by "interior volcanic stress." His argument, however, scarcely accords with what seems to be the true interpretation of his own descriptions. He regards the solidification of lava as a simple process of cooling, as in the formation of ice from water. But it is certain that the molten material from the earth's interior, which we technically call magma, is a chemically complex solution heavily charged with occluded gases, chiefly steam. That relief of pressure and expulsion of these gases are important factors in solidification is well established. Indeed, as Professor Doelter has recently suggested, it is likely that, under certain not improbable conditions of temperature and pressure, an ascending column of lava may become viscous or partly solid at an intermediate stage on its way to the surface, and regain its original fluidity at a still higher level. Professor Arrhenius, the eminent Swedish chemist and physicist, has recently discussed in a masterly way the probable constitution of the earth. He reaches the conclusion that about one-half the mass of the globe, or 80 per cent. of its radius from the centre outward, is probably metallic iron—but iron so intensely hot and so enormously compressed that it is physically a gas with the rigidity of a solid. An additional 15 per cent. is occupied by a spherical zone of similarly compressed gaseous magma, which grades outwardly into a zone of liquid magma amounting to 4 per cent. of the radius. Finally, there is the solid crust, with a probable thickness of about 1 per cent. of the total distance from the surface to the centre of the earth.

Accepting the view that there can be no volcanic action without telluric gases, Professor Arrhenius believes that the steam thrown off during eruptions has been derived from the oceans. He regards the ocean bottom as a semi-permeable membrane through which water under pressure descends into the earth. In its descent the water becomes heated, and finally, as steam, reaches the zone of liquid magma and is absorbed. It is this absorbed steam that supplies the explosive force of volcanic eruptions. According to the same authority, the physics of the eruption are closely analogous to those exemplified in the activity of a geyser.

It seems fairly certain that most volcanic eruptions are due to the expulsion of gases from magma that, by relief of pressure, has become suddenly over-saturated with its volatile constituents. This being conceded, the conclusion that, at some point in the volcanic conduit, lava, instead of being blown into fragments at the moment of eruption by the explosive expansion of its occluded gases, will, on relief of pressure, merely expand and solidify as rock-froth or pumice, seems inevitable. In other words, there must be an intermediate state between lava expelled from the crater as dust and the liquid magma below. That the spine was composed of pumiceous or vesicular lava solidified in this manner within the volcanic throat, was suggested by Mr. G. K. Gilbert, who supposed that the solidification was due merely to the absorption of heat by the work of expansion. It is probable, however, that chemical forces were at least equally potent in determining the passage of the magma into a solid upon the expulsion of part of the gases. The "burnt-out" cindery appearance of the spine, "the whole looking much like a furnace product," is a feature that Professor Heilprin emphasizes in support of his view, but which is perhaps suggestive rather of the more generally accepted explanation—that the tower was an extrusion of recent, solid andesitic lava.

In the concluding chapter the causes of volcanic action are discussed with particular reference to the Antillean region, where, as Professor Suess long ago pointed out, the earth's crust is under conditions of stress highly favorable to volcanicity. As the author well shows, the volcanic paroxysms in this vast area, stretching for 1,800 miles from Central America to the Windward Islands, are so obviously coördinated as to demand for their explanation a condition of regional instability of which the subsiding floor of the Gulf of Mexico is one manifestation. "It was not without reason," says Professor Heilprin, "that Milne advanced the view that the earthquake of Quezaltenango was the real initiator or instigator of the disturbances that followed rapidly upon it; it took the lid off the boiling pot, and the pot exploded."

It is now generally admitted that volcanic activity cannot be due to a sudden influx of sea water through open fissures to the earth's interior. Whether, as Professor Arrhenius suggests, the sea bottom is semi-permeable to water which is ultimately absorbed by molten magma at great depth; or whether, as Professors Suess, Tschermak, and Doelter maintain, the water is original in the magma and is the

primal source of the oceans, is a moot question. But the author's statement that the problem of the source of volcanic water offers little fruit is perhaps rather pessimistic. The work of Suess on hot springs; the suggestion of Professor Tschermak that volcanism is a cosmic phenomenon, occurring independently of oceans—in the sun for example; and modern work on the origin of ores, all encourage us to believe that the fascinating and recondite problems of the earth's interior will be slowly solved.

As minor defects in Professor Heilprin's work may be mentioned a tendency to introduce irrelevant matter, as a discussion of the origin of the Sahara, and the use of such misleading expressions as "fed with volcanic fire," "burnt-out cinder masses," and "blue puffs of sulphur." In giving the results of Professor Moissan's analysis of fumerole gases from St. Pierre, the author curiously omits nitrogen, which formed 55 per cent. of the whole. The volume is well printed, and is attractively illustrated by twenty-three half-tone plates, of which all but five or six are germane to the tower of Pelée.

The Amateur Spirit. By Bliss Perry. Houghton, Mifflin & Co. 1904.

The amateur, the *amator*, "the man who loves," has always taken for granted a certain superiority to the professional. A young Greek at Athens when the Sophists were teaching the gilded youth a method which was to make them seem masters of every trade, blushed hotly if one implied that he might put his training to a professional use. Public opinion in those days gave the precedence to the amateur. If he has any such precedence to-day, it is because he takes it himself from a society too busy to dispute it. It is only in athletics now that the professional suffers any social disadvantage, and for that he has very solid compensations.

That "veiled hostility between the man who does something for love which another man does for money" (Mr. Perry is perfectly clear though his grammar is somewhat amateurish), the author regards as the instinctive reaction of the spirit of man against the dangers of the professional habit of mind. The amateur is afraid of a civilization that "encourages men to approach life from one side only." We should be inclined to think that it is for himself that he is afraid. In all the nice balancing of the first essay, which gives the title to his book, Mr. Perry may betray his love for the amateur; but the professional has his respect. How fatal the amateur spirit can be when it lays hold of a nation, was proved by the Boer war, when England, that "nation of amateurs," paid dearly for her contempt of method and training and her reliance on the native virtues of the British temperament.

All the six essays in the volume have some reference to the working of the amateur spirit in the world. Two are devoted to that long-suffering person, the college professor. There is on the whole no class of men in American society about whom so much uneasiness is felt as about the college professor. The members of the busy world, recognizing now and again for a moment that he is their affair since he educates their sons, exhort him to remember that his poverty is dignified by the sacredness of his mission to their families. He is urged on all hands to respect himself and make his students respect him on a salary that would not keep one of them in pocket money, and to lead the simple life, which takes a great deal of money. Only Professor Münsterberg faced the situation when he suggested that, in a community which respects men in proportion to their ability to make money, it is ridiculous to isolate one class and bid it be clever and good and let who will be rich. Mr. Perry, with all his respect for the profession, writes as usual an apologia for the professor. His faculty circles making pathetic efforts to grow worldly in their riper years, plunging desperately into dancing-lessons or duplicate whist, are enough to freeze the blood of every junior member of a college faculty. The picture is true to life and should be faced. "He who can, does; he who cannot, teaches," says Mr. Bernard Shaw. It is a brutal truth for many a young man who, without the power to do creative work in his subject, and with no real enthusiasm for teaching, has taken the line of least resistance and has achieved a state of mind in which five months' vacation in the year seems absolutely necessary, and a nine o'clock lecture an imposition. No man who had the wit to go into a grocery store would choose the enervating, slipshod existence that is a too common interpretation of the academic life. Lowell was one of those who felt that he had escaped academic atrophy, the least honorable sort of decay. When he was a college professor he "used to lecture for an hour or two, go back to Elmwood, fill his pipe, and thank God that he had done a day's work." To Lowell, unlike Browning's grammarian, that seemed the time to ring up the curtain and "taste life," and there are many men in our generation for whom the chair of a professor is too narrow. So we have the new type, the sophisticated professor, "the expert who knows all about railroads and bridges and subways; about gas commissions and electrical supplies; about currency and banking, Philippine tariffs, Venezuelan boundary lines, etc." These happy individuals "combine technical training with practical capacity." They are not amateurs of life; they have decided both to live and to know.

The little sketch of "Hawthorne at North Adams" is an interesting reconstruction of that village when, fifty years ago, Hawthorne wandered over the neighboring hills, and was there inspired with the story of "Ethan Brand," whose setting is drawn exclusively from notes taken at North Adams. The moral problem in that tale was Hawthorne's own problem. He came to North Adams at a time when he felt that, like Ethan Brand, he ran the risk of becoming "a cold observer, looking on mankind as the subject of his experiment. . . . When he left North Adams, it was to enter almost at once upon the life of a weigher and gauger in the Boston Custom House, and to stand thenceforth in the ranks with his fellow-men."

The ideal which Mr. Perry sets before his readers in these essays is the combination of "the professional's skill with the zest and enthusiasm of the amateur." It is the doctrine that was preached with emphasis some years ago by the late Mr. Goschen when he exhorted the English, in a phrase that had a brief vogue, to take an "intellectual interest" in their work, whatever the work might be. There is everything to be said for such a doctrine, and Mr. Perry in these essays covers a good deal of the ground in a very agreeable strain.

Modern Tariff History—Germany, United States, France. By Percy Ashley, M.A., with a Preface by the Rt. Hon. R. B. Haldane. E. P. Dutton & Co. 1904.

This volume comprises the substance of the lectures delivered by Mr. Ashley in the Lent and summer terms of the past year to his classes in the London School of Economics. Derived almost wholly from secondary sources intelligently selected, they afford in short compass a good sketch of the history of the tariff during the past century in the three countries designated in the title of the book. The impetus to Mr. Ashley's work was given by the vigorous propaganda which Mr. Chamberlain began in 1903 for a system of preferential duties between the different parts of the British Empire. Mr. Ashley, so Mr. Haldane assures us in the preface, began his inquiry into the history of foreign tariffs without bias. The method of inquiry followed was the historical method, and the result is practically a reaffirmation of the traditional view in favor of free trade as against protection. The conclusion reached, however, is not based solely on grounds of cosmopolitan economics, but upon a forecast of the probable future needs and development of the constituent parts of the Empire. It is not a little curious, by the way, that Mr. Percy Ashley's elder brother, Prof. W. J. Ashley, is one of the two professional economists of note in England who have taken up the cudgels for Mr. Chamberlain's scheme.

In Mr. Haldane's very interesting preface he observes that the only adequate method for an investigation of this kind is the historical method—"the plan of examining the state of things that has to be inquired into in connection with its past, and in the light of all materials which can show why and by what steps it has come about." One may fairly insist, however, that the historical method as thus defined would shed less light on the problem than Mr. Haldane imagines. Indeed, the inadequacy of the historical method, pure and simple, is here shown, in that the industrial prosperity of Germany (p. 135), of France (p. 358), and of the United States (p. 261), is admitted by Mr. Ashley to be the product of many factors of which tariffs are but one, and one whose specific contribution to the joint result is confessedly incapable of measurement. Nothing at this day and hour is more to be deplored than a revival of the old *Methodenstreit* in economics. It suffices to say that Mr. Ashley employs the historical method judiciously and effectively, with an evident knowledge of its limitations. His cautious inference from given conditions evinces a better insight into its capabilities than would be suggested by Mr. Haldane's rather indiscriminate panegyric upon the historic method.

This history of tariffs in three different

countries presents some curious analogies. Thus, the Zollverein in Germany, which secured virtual freedom of internal transit and which culminated in the creation of the German Empire, is strangely like the federating process by which the American States were moved to form a central government which guaranteed freedom of interstate commerce. As regards the United States and France, the strongest point of likeness is that in both countries the bases of their present high tariffs were laid in the exigencies of war finance in the decade 1861-1871. Again, in all three countries Mr. Ashley points out the undisputed fact that protected interests have often exerted an undue and preponderating influence upon the lawmakers. In all three States, moreover, there has been manifested in the last two decades a strong protectionist movement, based on the necessity of taking the agriculturist into the protective partnership. And, lastly, in all three States various preferential or retaliatory projects have within a quarter of a century been grafted upon the earlier tariff trunk to afford a card in diplomacy or a club in a tariff war. Not the least instructive part of the book is the account given of various tariff wars—between Germany and Russia (pp. 92, 93), between France and Italy (p. 334 sq.), between France and Switzerland (p. 347 sq.)—and the almost inevitable loss suffered by both parties to the conflict. As a weapon, a differential tariff is a boomerang *par excellence.*

Instructive as is this comparative tariff history in many other respects, it is peculiarly excellent as affording an insight into what is called Neo-Mercantilism, and its correlative—which might perhaps be called Neo-Libertarianism. The advocates of protection in Germany, for example, as typified in such a man as Wagner, do not fail to recognize the validity of the abstract free-trade doctrine if based upon a cosmopolitan and static view of industry. But they contend that it should be Germany's ideal, situated as she is geographically and politically, to be self-sufficing, not dependent on the food supply grown on a foreign soil. Hence the policy of agrarian protection. In England, the followers of Chamberlain and his opponents no longer view the question of free trade from the standpoint of thirty years ago. To Cobden free trade was something recognized as supremely beneficial *semper, ubique, ab omnibus.* One could not lay claim to being an orthodox free trader unless he was ready to affirm that, despite the policy of other nations, absolute free trade was a *sine qua non.* This dogma was like the alleged Calvinistic test of being a Christian—a willingness to be damned for the glory of God. To Mr. Ashley, on the other hand, free trade is to be supported because, despite the growing inability of Great Britain to provide financially for the protection of the oversea empire, Mr. Chamberlain's scheme of preferential duties would not augment but lessen the financial power of Great Britain, and very likely provoke friction in the colonies at the same time. To one versed in the older habit of thought, the presumption of the modern thinker in forecasting the political and industrial future a generation or even a century in advance is somewhat appalling; but it is in the air, and so long as it rules the thought of the present day, it is at least reassuring to learn, as in Mr. Ashley's case, that it need not necessarily lead to the espousal of protection, retaliation, reprisal, and war.

The Oxyrhynchus Papyri. Part IV. Edited by B. P. Grenfell and A. S. Hunt. Egypt Exploration Fund, Græco-Roman Branch. London. 1904.

The present volume contains for the most part papyri found in the second excavations at Oxyrhynchus in 1903. It will not be as amusing to the general reader as certain of the previous volumes, since it includes but few of the non-legal and non-literary, but excessively human, documents that gave in them such a sparkle of life to the pages of a very dead subject. The reason for the present seriousness is not that no such papyri were found in the later work, but that on the one hand literary papyri of great interest called for immediate publication, along with a group of fragments from the Augustan period, which is rarely represented in these finds; and on the other hand, the size of the annual volumes is limited by the contents of the treasury of this branch of the fund. Many papyri of the third century are therefore held over for later publication, and apparently several seasons must pass before we shall be through with the work on this fruitful site.

First and foremost in importance among the theological papyri are the new Sayings of Jesus, which have been published separately, and have been already described in these columns. The final remark upon them by the editors points out their interest for many other persons than professed theologians:

"The mystical and speculative element in the early records of Christ's sayings, which found its highest and most widely accepted expression in St. John's gospel, may well have been much more general, and less peculiarly Johannine, than has hitherto been taken for granted."

Three other theological papyri, all of the third or early fourth century, are also of interest. One of these is a brief fragment of a lost gospel, which contains some sayings of Jesus that are found in a closely similar form in the canonical gospels, and some other sayings that have a resemblance to those in the so-called Gospel according to the Egyptians. A considerable portion of the Book of Genesis in the Septuagint version, and another of the Epistle to the Hebrews, are not without textual interest and importance. A reminiscence of the Decian persecution is contained in a petition from a certain man in behalf of himself, his son, and his daughter, that the commission appointed to make inquisition against Christians should certify that he and his children had in their presence poured libations, offered sacrifice, and tasted the offerings, as the imperial edict required.

Of interest among fragments of lost classical works are pieces of a Partheneion and Ode of Pindar, of the first century B. C., and a bit of the argument of a play of Cratinus, the "Dionysalexandros." But the especial treasure of the volume is a new Latin epitome of Livy, covering Books 37-40 and 48-55. The papyrus is of probably the third century, and has no such literary merit as the extant Epitome, being merely a bare list of events, mentioned one after the other without the least attempt to connect them together. But the events are grouped by books and years, with the names of the consuls for each successive year carefully given, from which it becomes possible to correct certain more vague indications of chronology in the extant Epitome. The first part of the papyrus contains no new facts, of course, since it covers a portion of the extant history. But this part, by comparison with the full text, gives valuable information about the principles on which the epitomator worked, thereby enabling the student to form a more critical judgment of the second part of the MS., which covers books no longer extant. The author of the Epitome probably lived in Egypt in the second or third century. The editors remark that this discovery of an Epitome in which the names of the consuls, in the ablative case, are prefixed to the events of each year, goes far to support the acute conjecture of Mommsen from internal evidence in the case of Cassiodorus and Orosius, that these authors used such an Epitome rather than Livy's complete text. The new Epitome enables us to fix more definitely certain facts about which the testimony of extant authors is not precise, and in some details to correct previous errors. A number of new facts also are supplied. Singularly enough, the accusation of L. Aurelius Cotta by Scipio Africanus, which has previously been assigned to one of the years 133-129, on the authority of Cicero, is set down by the papyrus under 138, which appears to bring Livy and Cicero into conflict. The editors have been assisted in their annotation of the Epitome by Mr. Warde Fowler and Professors Kornemann, Wissowa, and J. S. Reid, the last of whom has published further, and very important, remarks of his own in the *Classical Review* for July, 1904. Doubtless much further discussion will be prompted by the discovery of such a notable, and puzzlingly defective, historical document. Even the writers of Roman history for schools will need to take it into consideration.

The volume contains a goodly number of interesting legal documents, which increase our knowledge of details of Egyptian administration and Græco-Egyptian law. The number of personal letters is, as we have intimated, very few. One (of the year 1 B. C.) is of curious interest, if the reading is correct, as bearing witness to the practical as well as theoretical authority of the paterfamilias over the fate of a newborn infant. A man writes back home from Alexandria directions that if the expected child proves to be a boy, it is to be reared (apparently this is the meaning), but if it proves to be a girl, it is to be exposed. Actual instances of such power of life and death over children born in the household are rare enough at this period to render a possible addition to their number noteworthy.

Genealogical Sketches of the Woodbury Family: Its Intermarriages and Connections. By Charles Levi Woodbury. Edited by his sister, E. C. D. Q. Woodbury. Manchester, N. H.: Printed by the John B. Clarke Co. 1904. Pp. 251.

These sketches, so the editor tells us, "were not meant for the eye of the general public, but for that portion of the Woodbury family directly interested in the

one who first undertook their compilation." The critic is thus disarmed at the outset. But we are sure that no portion even of the Woodbury family is content to stumble around in the dark merely for the want of an index of names. Ungallant though it be to bring the charge, we must protest that a book, otherwise so well edited, should thus suffer at the hands of its sponsor.

Few men familiar with Boston in the latter half of the century just past did not know, at least by sight, that sturdy leader of the Democratic party in Massachusetts, Charles Levi Woodbury (1820-1898). "Judge" Woodbury the newspapers used to call him, simply because he was a distinguished lawyer who was getting along in years. At an earlier date "the boys" liked to speak of him as "Charlie Woodbury." Among his friends he towered above other men, as one of the heartiest and noblest of those downright good fellows, with plenty of brains, that New England had furnished to the metropolis. The son showed himself an abler lawyer and a more accomplished man than the father, Levi Woodbury.

The younger Woodbury manifested also a taste for letters. He was fond of books. A precious collection of his was burned in the great fire of 1872, and he set about making another collection, which grew to be almost as valuable. Though a little inclined to indolence, he applied himself to writing articles, chiefly upon topics of local history, and so he put into shape the sketches of his ancestry that form the pages of this volume. He did his own thinking. He wrote plain English. A love of the sea and of the seacoast, indeed of all that is free and breezy and bountiful, marks his style. Probably no other man of his time possessed a more intimate knowledge of the early history of Massachusetts Bay or of the scanty coast of New Hampshire, "the Pascataqua region," than Mr. Woodbury. He was a collector of books. Along with his impulse toward broad and catholic views, he had schooled himself to be accurate in every statement. With an unerring eye he read the character of the first settler. He read it, too, in a tolerant, healthy-minded spirit.

'An Old Planter in New England,' privately printed, tells the story of John Woodbury of Cape Ann, the founder of the Woodbury family in America. In terse language Charles Levi Woodbury had already preserved for posterity in this monograph the record of an eminently useful life. This same John Woodbury is the starting-point for a series of sketches in the present volume. There is an opening chapter on genealogy. It is by far the best treatment of that subject we have ever seen. We are tempted to quote a word or two where the writer upholds the dignity and worth of the more prominent of the New England settlers.

"An ancestor who was a deputy, or a military officer, or a deacon, was a man of rank and precedence. Were he a minister, a magistrate, or of the council, or perchance governor of a colony, he also was a man of notable colonial rank, whether he bore coat armor or were ignorant of its very existence. He got his rank of the people in its sovereign aspect and authority because it was freely and voluntarily given, thus making it intrinsically higher in quality and dignity than any title the king might confer on a subject of his own suggestion and pleasure, and to-day should be held in more reverence" (p. 21).

The work comprises thirty-four chapters. The various Woodburys are described and their children named. Then an incursion is made into the field of "The Wives of the Woodburys." Here we have such names as Batchelder, Dodge, Traske, Herrick, Perkins, Palgrave, Clapp, Quincy, Wendell, Gookin, Flynt, De Kay, and many others.

Levi Woodbury of New Hampshire (1789-1851) had a career that was wonderful. At twenty-seven he was judge of the Supreme Court of New Hampshire, and shortly after, chief justice; Governor at thirty-four, and United States Senator at thirty-six. He became Secretary of the Navy under Jackson in 1831, and Secretary of the Treasury in 1834; he was again chosen United States Senator, and finally took his seat in 1845 as an associate justice of the Supreme Court of the United States. He declined two foreign missions, of the highest importance, and was generally looked upon as the prospective candidate of the Democratic party for President in 1852, had he lived. The family of Levi Woodbury for many years has been prominent in Washington. One of his daughters, the wife of Montgomery Blair, of Lincoln's Cabinet, is remembered as a charming and good woman. Another is the widow of G. V. Fox, distinguished as a most efficient Assistant Secretary of the Navy during the war for the Union. The child of another daughter is married to the Duke d'Arcos, for some time Spanish minister at Washington. The name also survives in two grandsons, Woodbury Blair and Woodbury Lowery, gentlemen of distinction at the capital—the latter an author of some little note.

The editor has performed her task with the taste and discrimination to have been expected. Though the manuscript had been prepared by her brother almost exclusively for the use of the descendants of John Woodbury, it is well that the material is now laid open to the use of the public. We can say of this volume, what can rarely be said of a family history, that it will surely prove of interest to the general reader. Here we have original thought, expressed by a man of remarkable ability, in terms that are attractive, flavored by what may be called "a genuine democratic spirit." In other words, the book is valuable as giving a clear and true insight into the processes of development of the New England people.

Imperial Vienna: An Account of its History, Traditions, and Arts. By A. S. Levetus. Illustrated by Erwin Puchinger. John Lane. 1904.

The volume before us is both more and less than its sub-title implies. There is a good deal of "history" (141 pages out of 416), an indefinite amount of "tradition," and very little (ten pages) about "art, including sculpture and painting under Franz Josef"; but there is, in addition, something about literature, the theatre, dancing, court festivities, society, education, and the life of the common people. And, of course, the guide-book element is all there—description of streets, squares, buildings, monuments, churches, palaces, etc. The whole is enlivened by more than 150 well-selected and, for the most part, very clever illustrations from sketches in charcoal, pencil, and pen-and-ink. The typography, too, is very attractive, and the entire book pleasing to the eye in every way. Nevertheless, the result is disappointing. Not that the book is, on the whole, uninteresting or inaccurate. Mr. Levetus, whether an Englishman or a Viennese, knows the Kaiserstadt, has consulted good, though not many, sources, and is not sensational in the treatment of his topics. The book is entirely free from the wild extravagance of the "Martyrdoms" and the other pretended "revelations" of Viennese life—it is an honest effort to describe the Vienna of to-day, but one is tempted to apply to it Lessing's dictum: "One is precious little if all one is is honest." At its best utterly devoid of literary grace, it contains many sentences of almost incredible crudity, and some which make one wonder how they could have escaped the eye of the most careless proof-reader. Thus we read: "Although in 1849 a Constitution was granted, still, after a trial of two years it was dissolved and was not again called together till 1860"; and "There is nothing goes on in the city without the Emperor attending it." In other respects, the proof-reading is very good. There is scarcely a misprint in any of the German titles and sentences quoted, though errors in names abound: Schnörr, Carnova, Petteinkofen, "Philippine Leppi" (for Filippo Lippi), Glück, Szandor (for Sándor), "Heback" (for Herbeck), Tiapolo, etc. Errors of fact are not so numerous, the historical portion, indeed, being quite accurate, though the Franz-Josef's Quay was not opened in 1896, but, as far as our recollection goes, early in the sixties; and it is not true, in more than one way (aside from the Irish bull involved), that "the most popular living novelists are Ferdinand Kürnberger . . . and many others, including Ferdinand Gross, who is now no more." Ferdinand Kürnberger died in 1879, and Ferdinand Gross was not at any time, either before or after his death, a popular novelist or anything more than a modest *feuilletoniste.* Nor is it true of Grillparzer that, "during his visit to Italy, he happened to be going up Vesuvius just at the same time the Emperor Francis I. and the Empress were climbing down the mountain. The Kaiser at once recognized him, and addressed him in a friendly manner, saying: 'Oh, my dear Grillparzer, you are also here? It is very beautiful, but mind the lava.'" The fact is, the Emperor was not present at all on that occasion, which Grillparzer describes as follows in his 'Selbstbiographie':

"Near the hermit's lodge a cavalcade of several veiled ladies, accompanied by their retinue, came towards us. I recognized the Empress of Austria by the livery of the servants. I tried to stop my hurrying donkey, or at least to get him out of the middle of the path, but succeeded only in putting him in such a position that when the Empress passed us, my back was turned to her. I could merely take off my hat, but could not see her."

Of the lack of literary skill shown throughout, nothing is more characteristic than the fact that, while several pages are devoted to the painter, Rudolf von Alt ("no word is too great for the grand old pioneer"), the uninitiated would never suspect that all his work was in water color. Still, there is valuable material in this work for some future Augustus Hare or Howells,

who may wish to write 'Walks in Vienna' or 'Viennese Life.'

In to the Yukon. By William Seymour Edwards. Cincinnati: Robert Clarke Co. 1904. 8vo. Pp. 312. Illustrated.

This volume comprises the observations of a traveller from West Virginia, via the Great Lakes and the Canada Pacific Railway to the Pacific Coast, the Canadian Yukon, southern California, and return. It belongs to a class of which many have been printed, and from which in general little is to be expected, either by the literary man or the geographer. It is somewhat of a surprise, therefore, when, in perusing the work, one discovers that it has some positive merits. Mr. Edwards seems to be a clear-sighted observer, and his narration is straightforward and unpretentious. He appears to possess the knack of gathering and summarizing popular opinion without the exaggeration or superficiality usually characteristic of hasty newsgatherers.

The most interesting portion of the book is naturally that relating to the Klondike region. When the excitement of new discoveries and the rush of population are in full intensity, the press is filled with correspondence and descriptive matter relating to the region concerned. But, after business begins to assume a more normal character, prices have fallen, and mining has become systematic instead of spasmodic, the newspapers and magazines abandon the field for others promising some newer sensation. It is a conspicuous merit of Mr. Edwards's story that it gives us what looks like a fair and impartial account of conditions on the Canadian Yukon in the summer of 1903, and of the state of public opinion there in regard to the manner in which the Canadian Government has discharged its duty of regulating this distant territory mainly populated and exploited by energetic foreigners from "the States."

There has been so much just criticism of the neglect shown by the Republic toward the proper governing of her own Territory of Alaska, that it is interesting to compare the results of the minute and rigorously paternal rule of the Dominion under analogous conditions. There is no doubt that the Canadian Parliament has recouped its expenditures for the Yukon district by taking liberal tithes of the product of the mines, by its taxation of wood, water, and imported goods. It gives one a shock to learn, however, that, to make sure that no gold dust gets out of the territory without paying its two and a half per cent. to the Dominion, a female customs inspector strips to their chemises all the women in the railway coaches of the White Pass Railway, on outbound trains. Even the New York customs requirements seem to be tolerably decent after that.

It is well known that in the early days, especially in the post-office and police forces, a certain amount of "graft" was winked at by the Dominion authorities, chiefly, it is to be supposed, because on no other terms could they have kept any officials at all while fortunes were being had for the digging all about them. Now that things have settled down, if we may credit Mr. Edwards's report of public opinion in Dawson, corruption has shifted to Ottawa, and is shown chiefly in the granting of private concessions to individuals, such as the one discovered to be possessed of

"an exclusive blanket grant to all the water rights of the Klondike valley and its affluent creeks, as well as the exclusive right to hold and work all gold-bearing land not already occupied, and also to hold and have every claim, already staked or worked, which for any reason may lapse to the crown, either for non-payment of taxes or any other reason, thus shutting out the individual miner from ever staking a new claim within this region, should he discover the gold, and from taking up any lapsed claim and from re-filing his own claim, should he be careless and neglect to pay his annual taxes by the appointed day. Another man . . . appears with a similar concession covering the famous Eldorado and Bonanza Creeks, where land is valued by the inch, and millions have been dug out" (p. 140).

"So vigorous has been the protest against these daring abuses of a Government clique that this summer (1903) what is called a Dominion Royal Commission has been sent to investigate the situation" (p. 143).

It is pleasant to turn from these unsavory revelations to the description, illustrated by an equally surprising photograph, of the first annual exhibition of the Yukon "Horticultural Society":

"The biggest beets I have ever seen, the meaty substance all clear, solid, firm, and juicy. Potatoes, Early Rose and other varieties, some new kinds raised from seed in three years—large, a pound or more in size. And such cabbage, cauliflower, and lettuce as you never saw before! Many kinds, fullheaded, and able to compete with any produced anywhere. All these raised in the open air on the rich, black bottom and bench land of the Yukon" (p. 144).

The illustrations are exceptionally good and fresh, from the author's own photographs. The volume would be none the worse for possessing an index.

Th. Nast: His Period and his Pictures. By Albert Bigelow Paine. The Macmillan Co. 1904.

Time hurries on so rapidly that it has already made Nast and his period a part of the past, and Mr. Paine has done the public a good turn in preserving this record of a great caricaturist. The scale of the drawings is so different from that originally adopted as to impair here and there the impression made by them, but their power and humor are so vital as to be indestructible. Of course, they are more amusing and attractive to the survivors of the period than to the new generation which has forgotten to whom it owes its Tammany Tiger and its Republican Elephant, but we can hardly imagine a time when our successors will not turn back with interest to these cartoons. Gillray is dead and buried, but he lives again in those undying caricatures which helped to put courage into the hearts of the enemies of Napoleon. Of Nast as an artist it is unnecessary to speak—we do not mean in any way to undervalue his original gift—for, having once devoted himself to political satire and caricature, he appealed to a political public, and no technical criticism can affect the success which that public's approval gave.

Nast was born in Germany, but came over here so young that the country was never foreign to him; very likely, however, his Teutonic parentage and inherited tendencies made him the better able to appreciate those differences and contrasts on the feeling for which any successful caricature must rest. Certain it is that he grew up with a Teutonic honesty of mind and heart; and this gave him a divine mission to help to their doom the wonderful group of hypocrites and thieves who, under the leadership of Tweed, Sweeny, Hall, and Connolly, gutted the treasury of New York. It is no doubt by the Tammany Hall and Tweed Ring series of cartoons that his name will be perpetuated. To us he made the faces of the four as familiar as those of any eminent characters in ancient or modern history. Of his war pictures, which in their day were effective and pathetic arguments, it is an obvious criticism that he had not then fully found his vein. His wonderful eye for a likeness (the real expression of the face is always there, only made slightly grotesque) now guided him along a sure path, while his strong political sense gave him an abundance of perfect situations. Tweed was identified and captured through one of his pictures, and, in turning over the pages of this volume, one is struck with the constant sense of being in a portrait gallery of old acquaintances.

As good a test as any is to take a caricature meant to express an idea which is to us untrue. Nothing is really further from the fact than the notion that Sumner, Schurz, and the Liberal Republicans of 1872 were abandoning the negro in their preparations for the support of an independent candidate for President; but we defy anybody who ever saw those gentlemen to refrain from laughing at the sketch of "The Boat's Crew that is Going Over: Will Robinson Crusoe Desert his Man Friday?" Robinson Crusoe is Sumner; Friday, the poor negro on his knees bemoaning the approaching event; the hesitating Crusoe, absorbed in himself, is being hurried into the boat ("Cincinnati Convention") by the two conspirators, Schurz and Fenton; in the stern sheets is standing the enthusiastic and vociferous Greeley, waving his broad-brimmed hat in the direction of a full-rigged ship, "Democracy," in the offing, flying the "K. K. K." flag. Every face in the boat is a speaking likeness. And what shall we say of McKinley, weeping after Harrison's defeat, and the wonderful Tilden caricatures, and of those of Blaine? As we linger over the pages of Mr. Paine's volume we feel what we have lost. There may, for all we know, be caricaturists to-day who have greater natural gifts; there have been in the past men like Tenniel or Gavarni (to go from one pole to the other) who may be considered of a higher order; but when we think of Nast's range and *vis comica*, and hearty, generous motive (never unpartisan, and never mean), and his skill in character portraiture, we close the book with a sigh of regret that the curtain is rung down, and that the show which for us older playgoers lasted so long and so pleasantly, is over.

Mr. Paine's Life is evidently a labor of love. The author is an enthusiast, and must be followed in the light of his enthusiasm. He explains very fully the differences between G. W. Curtis and Nast, at the time of the Liberal campaign of 1872, and their effect on the attitude of *Harper's Weekly*. In narrating the history of the caricaturist, he follows that of his own times, and in this way has made, for any one who desires to understand the United

States from 1860 to 1896, not only a very entertaining, but a very useful volume.

Das Goldene Buch vom Eigenen Heim; Eine Hauskunde für Jedermann. [By many different authors.] Berlin and Stuttgart: W. Spemann; New York: Lemcke & Buechner. 1905. 729 numbered paragraphs.

This is a stout little volume, bound in gilded cloth, with an elaborate stamped pattern in red and marbled edges, all of a rather pretty effect; one of a series dealing with Music, Art, Literature, Manners and Customs, Health, and the Theatre. It seems as if all worldly subjects were to be included, sooner or later, in this handy encyclopædia. This initial volume takes up House Architecture in general, and devotes one-fourth of its space to a very practical study of needs and requirements, plan and construction, giving pictures of three-score dwelling-houses, and plans of many of them. Then comes interior decoration, with the visible media of heating and gas-lighting and electricity, and with illustrations of much interest. Some of them offer very good and very original designs. In farther advancement of this subject the cover-linings may be studied; for they are printed with mottoes, ejaculations, and pithy sayings taken from the gables of old German houses and the roof timbers of covered bridges. For example—

"Ohne Gottes Schutz
Unsrer nichts nutz";

but there must be nigh a hundred of them. A brief paper on Garden Architecture gives yet other exterior views of houses, with pavilions and fountains and similar luxuries of the park and garden.

Just half the volume has been used for the matters named above; and nearly all of the second half is given up to a history of domestic architecture, winding up with separate essays on Bavarian farmhouses, English villas and the like, with many and very useful pictures. Finally, about 75 pages are occupied with notices of German architects of the time, with a little portrait-head of each man.

The curious thing about the book is that it is really very good. The selection of subjects is intelligent, the curt statements are generally faultless, the illustrations are remarkably well chosen and instructive. If you must get your information and your judgment out of cheap little handbooks, this is one of the best of them; and it ought to be translated into English.

Seager's Introduction to ECONOMICS

By Prof. HENRY ROGERS SEAGER of Columbia.

560 pages, 8vo. $2.00 net.

In this clearly written and up-to-date book, the author treats the subject not only historically, but includes the consideration of such vital matters of to-day as the labor and railroad problems, tariff, capitalistic monopolies, etc. He shows vividly the intimate relation between Economics and business.

"Altogether the best introduction to the study of Economics that has yet been written."—*Annals of the American Academy of Political and Social Science.*

"Thoroughly modern in texture, wide in sympathy . . . clear, sprightly, and stimulating in style and in manner of treatment."—*Journal of Political Economy.*

"It takes a high place."—*Literary World.*

"Able and lucid."—*Philadelphia Press.*

REBECCA

By

KATE DOUGLAS WIGGIN

Select Statutes, Cases and Documents

To Illustrate English Constitutional History, 1660-1832

(With a Supplement from 1832-1894)

Edited by C. GRANT ROBERTSON, Fellow of All Soul's College, Oxford, Examiner in the Honour School of Modern History in the University of Oxford, 1901-1904. 8vo, $3.00 *net.*

In this volume Mr. Robertson has gathered together a large number of important cases and statutes which have had direct bearing on English Constitutional Law. The statutes include such famous acts as the abolition of the Slave Trade and the Royal Marriage Act. There are also detailed reports of thirty-two significant cases. This is a valuable book for all students of Constitutional Law, and it should find a place in every well-equipped legal library.

THOMAS Y. CROWELL & CO, New York

The Nation

VOL. LXXX—NO. 2069. THURSDAY, FEBRUARY 23, 1905. PRICE TEN CENTS.

A DIARY FROM DIXIE

By **MARY BOYKIN CHESNUT,** being her Diary from November, 1861, to August, 1865. Edited by ISABELLA D. MARTIN and MYRTA LOCKETT AVARY. 8vo, Ornamental Cloth, $2.50 *net;* postage additional.

This is the diary of a brilliant woman, the wife of a United States Senator who became an aide to Jefferson Davis and afterwards a Brigadier-General during the Civil War. Mrs. Chesnut travelled about with her husband, and met and entertained all the foremost men in the Southern cause.

THE FIRE OF SPRING

By MARGARET POTTER. 12mo, Ornamental Cloth, $1.50.

"Was written as a study of a condition of modern American life. Its theme, perhaps the oldest in fiction, has become typical in America only within the last decade. But the questions of just how far a man may let business absorb him without danger to his domestic life—of how long a young, romantic, inexperienced girl will bear loneliness in her married life, are being asked by many people in this country to-day."—*Margaret Potter.*

THE MOTHER-LIGHT

ANONYMOUS. 12mo, Ornamental Cloth, $1.50.

Love and the longing to live—that is the warp of this story. Can you live on and on unchanged by faith, as Mary Baker Eddy and Dowie, and, in this novel, the Mother-Light, claim? Is the love of man and woman the sin that kills? Does the Light contain the secret and the promise of eternal life *here?*

THE ARTHUR H. CLARK COMPANY
Publishers, Cleveland, Ohio

Important Announcement

Tanner's Elementary Algebra

By J. H. TANNER, Ph.D., Assistant Professor of Mathematics, Cornell University.

Price, $1.00

IN writing this book the author has aimed to make the transition from arithmetic to algebra easy and natural, to arouse and sustain the student's interest in the work, and to teach him to think clearly and to reason correctly. The exercises are numerous, well chosen, and carefully graded. Great care has also been given to the fundamental principles involved in algebraic processes. The book is designed to meet the most exacting entrance examination requirements of any college or university in this country, and especially the revised requirements of the College Entrance Board. The arrangement of the book will be found to be peculiarly suited to a briefer course where that may be desired.

AMERICAN BOOK COMPANY
100 Washington Square, New York City

JUST PUBLISHED

Trusts, Pools, and Corporations

By WILLIAM Z. RIPLEY
Professor of Economics in Harvard University.

12mo, cloth, xxx+477 pages. List price $1.80

A collection of important contributions by economic and legal specialists bearing upon the greatest problem in domestic politics now before the country.

GINN & COMPANY, BOSTON

NEW SCRIBNER BOOKS

THE LIFE OF REASON:
or PHASES OF HUMAN PROGRESS

By George Santayana, Assistant Professor of Philosophy at Harvard University.

Vol. I. Reason in Common Sense

Vol. II. Reason in Society

This is altogether the most important recent work in philosophy by an American, or perhaps by a scholar of any nationality. He has been engaged upon it for the last seven years. Three additional volumes will appear in due time, but each volume is an entirely separate work.

Each 12mo, $1.25 net. Postage 12 cents.

THE GREEK THINKERS
A HISTORY OF ANCIENT PHILOSOPHY

By Theodore Gomprez of Vienna University, Hon. LL.D., Dublin, Ph.D , Königsberg, etc.

Vol. II. Socrates and the Socratics

Vol. III. Plato

Translated by G. G. Berry of Balliol College, Oxford.

"We are glad to welcome the authorized translation of Professor Gom prez's great history of ancient philosophy. Such an excellent reproduction of so important a foreign work on one of the greatest of themes is an event."—*London Spectator.*

Each 8vo, $4.00 net.

A NEW VOLUME OF "LITERARY LIVES"

COVENTRY PATMORE

By Edmund Gosse

A new volume in this successful series distinguished by rare discernment. Mr. Gosse's estimate of Patmore's accomplishment and his place in literature is one of uncommon interest.

Illustrated, 12mo, $1.00 net, Postage 10 cents.

LOGIC: Deductive and Inductive

By John Grier Hiblen, Ph.D., Professor of Logic in Princeton University.

Presenting in addition to the more formal and traditional treatment of the subject, some considerations which have been contributed by the discussions of the modern logic by Sigwart, Lotze, Erdmann, Green, Bosanquet, Venn, and others.

8vo, $1.40 net.

OUTLINES OF THE LIFE OF CHRIST

By William Sanday, of Christ Church, Oxford

This work is a marvel of compression, taking as it does wi'hin its scope a broader field than the term "Life of Christ" ordinarily includes. It shows how the life of Christ can constantly be subjected to fresh treatment and made to yield new results.

12mo, $1.25 net. Postage 12 cents.

THE BIBLE: Its Origin and Nature

By Prof. Marcus Dods, D.D., of New College, Edinburgh

Professor Dods's answer to the inquiry "What is the Bible?" is a scholarly yet popular exposition of the origin and nature of the Bible, the doctrines of revelation, of inspiration, and of infallibility. He shows that historical criticism has discovered nothing which need destroy nor disturb the Christian's faith.

12mo, $1.00 net. Postage 10 cents.

WAYFARERS IN ITALY

By Katharine Hooker

This distinguished and interesting book, having sold three editions in its original form, is now put forth, in response to demand, in a cheaper edition, but with *all the illustrations* that distinguished its earlier publication. This book has distinctly made a place for itself in the permanent literature of Italian travel and comment.

Freely illustrated. 8vo, $2.00 net.

The STORY of ART Throughout the Ages

By Salomon Reinach.

"A little masterpiece."—*N. Y. Evening Post.*

"A more convenient work of reference for popular use in the field of art does not exist."—*N. Y. Tribune.*

"A valuable work to the student interested in the evolution of the arts of painting and sculpture."—*Chicago Inter Ocean.*

With 600 illustrations: $2.00 net. Postage 20 cents.

THE NEGRO: The Southerner's Problem

By Thomas Nelson Page

12mo, $1.50 net. Postage 12 cents.

"Mr. Page deals with the race question with admirable poise and judgment."—*N. Y. Evening Sun.*

"A calm discussion of what is probably the chief problem before the American people, written by a man thoroughly familiar with the subject."—*Mobile (Ala.) Register.*

"Decidedly suggestive."—*Chicago Inter Ocean.*

"One of the most dispassionate and illuminating discussions of the racial question in the South."—*Cincinnati Times-Star.*

"A survey of the problem which interested persons should certainly find helpful."—*N. Y. Times Review.*

WITH KUROKI IN MANCHURIA

By Frederick Palmer.

"The description have the great merit of enabling one to *see* the places he describes, and even to hear the action; he seizes on the vital point of a scene and fastens it on the reader's memory, . . . The vividness of the moment and the permanent charm of literature."—*London Academy.*

Illustrated 12mo, $1.50 net. Postage 14 cents.

The STRATEGY of GREAT RAILROADS

By Frank H. Spearman

"Highly dramatic is the story of the inception and the development of our great transportation lines. Frank H. Spearman is thoroughly conversant with the subject. He unfol's a tale as captivating as a well-conceived and well-written novel. He has clothed an ordinarily prosy topic with a new and altogether attractive vestment."—*New York Commercial.*

12mo, $1.50 net. Postage 13 cents.

CHARLES SCRIBNER'S SONS, NEW YORK

Important New Macmillan Books

NEW NOVELS PUBLISHED THIS WEEK

Mr. ROBERT H. FULLER'S *novel*

The Golden Hope

is a tale of the time of Alexander the Great; a riot of color, adventure and romance, of which the Macedonian Invasion of the Empire of Darius, and the siege of Tyre, are elements in the historic background. *Cloth, $1.50*

Miss ADELAIDE L. ROUSE'S *novel*

The Letters of Theodora

displays with great vivacity and humor the life of a young, and at first unsuccessful, literary woman in New York. It is a good story to read aloud, for Theodora's moods are an ever-changing joy. *Cloth, $1.50*

NOVELS RECENTLY ISSUED

Mr. Eden Phillpotts's *new novel* The Secret Woman

"is not only the best novel he has written, but also one of the greatest novels of the decade. . . . The drama maintains its intense interest through every change to the exciting close."—*Philadelphia Press.*

By the Author of "The American Prisoner." With frontispiece. *Cloth, $1.50*

CYRUS TOWNSEND BRADY'S

The Two Captains

is a lively story, full of exciting interest and romance of the times of Bonaparte and Nelson. *Illustrated. Cloth, $1.50*

L. H. HAMMOND'S

The Master-Word

is a keenly interesting picture of modern phases of the race-relations in Tennessee. *Cloth, $1.50*

Mrs. Sara Andrew Shafer's Beyond Chance of Change

Is in the same vein as her "The Day Before Yesterday" which the Philadelphia *Ledger* described as "half humorous, half tender, wholly delightful." *Ready next week. Cloth, $1.50*

OTHER IMPORTANT NEW BOOKS

Poverty *New Edition*

A Definition of Poverty, and an Estimation of Its Extent at the Present Time. By ROBERT HUNTER.
Cloth, $1.50 net. (*Postage 13c.*)

Mr. EDWIN MARKHAM calls this much-discussed book "the most impressive and important book of the year."

Dr. ÉMILE JAVAL

On Becoming Blind

Advice for the Use of Persons Losing their Sight. Translated by Dr. CARROLL E. EDSON. *Cloth, 16mo. Just ready*

The New York Public School

Being a History of Free Education in the City of New York. By A. EMERSON PALMER, M.A., Secretary of the Board of Education. Illustrated with 16 full-page plates.
Cloth, 12mo, $1.00

All the profits from the sale of the above are payable to the Teachers' Retirement Fund of New York City.

Labor Problems

By THOMAS SEWALL ADAMS, Ph.D., University of Wisconsin, and HELEN L. SUMNER, A.B.
Cloth. $1.60 net. (*Postage 13c.*)

Mrs. Alfred Ely's Another Hardy Garden Book

is by the author of that delightful yet practical book for the amateur, "A Woman's Hardy Garden," of which Mrs. ALICE MORSE EARLE wrote:

"Let us sigh with gratitude and read the volume with delight. For here it all is—what we should plant and when we should plant it; how to care for it after it is planted and growing; what to do if it does not grow and blossom; what will blossom, and when it will blossom, and what the blossom will be."

Ready next week. Cloth, 12mo, gilt tops, $1.75 net. (*Postage 13c.*)

THE MACMILLAN COMPANY, Publishers, 66 Fifth Ave., New York

The Nation.

NEW YORK, THURSDAY, FEBRUARY 23, 1905.

The Week.

Senator Lodge and other apologists for the Senate's attitude on the arbitration treaties evade the point of the discussion. Nobody questions the Constitutional right of the Senate to declare each subsidiary "agreement" under a general convention a separate "treaty." Nor is it doubtful that the Senate may, if it wish, so modify and mangle every diplomatic proposal of the Executive that treaty-making may become almost impossible. The real question is, Will the Senate exercise its powers in a way to facilitate or to impede public business? For the balance established by the Constitution between the initiative of the Executive and the consent of the Senate in treaty relations depends for its working well upon mutual consideration and good feeling. A President who pelted the Senate with obviously crude and injurious treaties would discredit that function of government. And a Senate which examines all treaties, not on their merits, but captiously with a view to asserting its own powers, has actually crippled our diplomacy. The Senate had a right to assert its jurisdiction over every most minute implication of a comprehensive treaty, but it had not only the right but the duty to delegate to the President the powers necessary to execute a needful instrument.

The principle of comity involved is clearly illustrated in Senator Lodge's maladroit citation of the powers of foreign parliaments over treaties; for the European States which require confirmation of treaties by the legislative branch display precisely that wise passiveness on the part of the referee for which we are pleading. There is almost a universal practice of prompt confirmation of non-commercial treaties, and with a minimum of discussion. That is, European bodies with the power of our Senate as a matter of course give full faith and credence to the Executive in its diplomatic capacity. These relations of comity, which are broken only in the rarest instances, arise out of the conviction that international business can be conducted on no other basis. There remains always the power of veto as a possible check upon a rash Ministry; but, short of such emergency, the confirmatory vote is given as a matter of routine and of loyalty to a coördinate branch of government. How damaging Senator Lodge's parallel with European parliaments really is to the Senate will be realized when one recalls that it is getting to be difficult to get any treaty through at all at Washington; almost unheard of to pass one in its original form. In fine, the Senate lies under just reproach, not for exceeding its Constitutional prerogative, but for gross misuse of its admitted powers.

"Irish Citizens Applaud the Senate." This is the headline which the *Gaelic American* of February 18 places over its account of the meeting of the United Irish Societies. Resolutions were there passed strongly approving the Senate for defeating the arbitration treaties, and denouncing Secretary Hay for trying to "force" them upon the country. For President Roosevelt the feeling of the meeting was one of "respect, but pity." He is "personally very popular with Irish citizens," and it was only to be regretted that he had "completely fallen under the domination of Secretary Hay." The *Gaelic American* further makes public a bit of secret history. It seems to us to demand attention from an exalted personage, or at least from some semi-official friend of his. Here it is (the italics are ours):

> "One speaker recalled the fact that when a committee of Irish citizens waited on Mr. Roosevelt in 1897 to ask him to speak at a meeting at the Cooper Institute to protest against the arbitration treaty with England, then before the Senate, he had, while declining to make a speech, expressed his *strong sympathy* with their opposition, and said he *hoped they would succeed*. His reason for declining to make a speech was that he did not want to publicly antagonize his own party, but he said he was *against arbitration between nations*, and believed that nations which were too long at peace *got rusty and enervated*. He believed in a strong navy and hoped to live to see one that would be able to *beat England on the sea*. The extraordinary change in Mr. Roosevelt's attitude since then was attributed to the malign influence of John Hay."

The San Domingo treaty cannot be acted upon at the present session, for want of time. When it comes up at the extra session next month the probability of radical amendment of it is reported to be great. Certainly, some of the clauses look as if a coach and four had already been driven through them, so loosely drawn are they. As for the treaty's great merit in "defining the Monroe Doctrine," concerning which there is such a flourish, that is a thing from which the most ardent Monroe Doctrinaire might well draw back. Precisely in its vagueness lie the strength and convenience of the Doctrine. It is the *ignotum* in it which terrifies. If we begin to "define" it, and bring it out of the mysterious darkness into the light of common day, we but shear our Samson. No, the only thing to do with the Doctrine is to leave it undefined; and the safe course for the President is to say of it, as the old Scotch woman did of the Solemn League and Covenant, "I dinna ken what it is, but I'll mainteen 't."

It is an unpleasant, but an extremely useful, function which Mr. Littlefield is discharging in pointing out to Congress at intervals what the consequences of its policies are likely to be. Twice at this session he has risen in his place to go through the comparatively simple problem of addition and subtraction by which one ascertains how large the deficit threatens to be. His speech last week on the logical outcome of the "big-stick" policy was an equally needed warning. In expressing his fear that this country may become "a minister plenipotentiary and envoy extraordinary for the money changers of Europe as guaranteeing the inviolability of the republics," the Maine Congressman has put into epigram the sound American argument against the attitude we are asked to assume toward the creditors of our southern neighbors. Mr. Littlefield's remarks were made in the course of debate on a naval appropriation bill of $100,070,079, the largest ever reported. To attack specific items must necessarily be the parliamentary procedure of the opponents of naval increase, but behind these tactics remains the greater question of what we propose to do with a huge navy when we have it.

Our Spanish Claims Commission bids fair to rival the almost incredible story of the French claims, on the score both of delay and injustice. Up to date, it has made awards in but three claims, amounting to $13,000. Meanwhile, the Commission itself has cost the Government, since its creation in March, 1901, only about $516,000, in salaries and expenses. This is a pretty sad record of inefficiency. At this rate, it will take the Commission some 500 years to pass upon all the claims before it. In any case, the claimants and many of their heirs will have died before they see the color of their money. Yet we went to war with Spain partly on account of these just claims of our citizens, and in the Treaty of Paris solemnly undertook to liquidate them.

Under a recent decision of the Attorney-General, the Treasury Department was authorized to apply the drawback clause of the Dingley act to wheat imported for reëxportation as flour. But this alteration of a tariff schedule by executive decree is naturally abhorrent to standpatters in Congress, and Senator Hansbrough last week proposed, and the Senate adopted, an amendment formally prohibiting such application of the drawback clause. This served notice on Mr.

Roosevelt that, if he is indeed zealous for tariff reform, he may as well face the issue squarely, and direct his attack upon the protectionist centre. It is evident that the Senate will give no countenance to slight incidental modifications of the schedules either by Treasury interpretation or by arbitration treaty. For those who desire genuine tariff revision, then, it is emphatically a case of going the whole hog. Time spent on indirect tariff reduction, excellent as such proposals may be in themselves, is as good as wasted. The standpatters are the enemy not only of the tariff-for-revenue men, but of the liberal branch of their own party. They may be crushed; they can hardly be outmanœuvred.

The House, meantime, has "asserted itself" against the pretensions of the Senate, on the ground that the Hansbrough amendment interfered with the House's Constitutional prerogative of initiating revenue measures. Senators, we think, might easily have shown how many times the House has meekly lain down under worse infringements of that principle. Granting the Senate the right to amend revenue bills—and this is all that is now claimed—it can make over, as it has done again and again, revenue bills, tariff measures, appropriations, until the House is not able to recognize its own children. The truth seems to be that Speaker Cannon and his lieutenants are very nervous about the decline of the House's prestige, but do not quite know what is to be done to restore it. A much surer means than they are now trying is open to them. Let them revive something of the deliberative quality; let the Representatives refuse to bolt raw masses of legislation, like the railway-rate bill, which they swallowed whole, ostentatiously pointing everybody to the Senate as the place where the measure was to be really digested. The way truly to assert the law-making power is to make laws, not to crowd foolish and crude bills through as if glad to shirk a job too difficult for them. However, the Senate promptly backed down, upon some division of opinion in its own ranks, and the Hansbrough amendment was cast out.

"An ecclesiastical lobby" is the term which Dr. Lyman Abbott applied to the influences behind the President's diversion of Indian trust funds to the support of Catholic mission schools. Cardinal Gibbons has denied that the most active advocate of the claims of the Catholics, Dr. E. L. Scharf, was an accredited agent of the Church; and it is, of course, absurd to suppose that the Church would ever give him formal authority to speak for it. But the statements of Senator Thomas R. Bard of California and Representative John H. Stephens of Texas, and the admissions of Dr. Scharf himself, have already made it clear that the latter's representations carried great weight. He offered, in return for favors to Catholic institutions, the good will of leading Catholics in various parts of the country. The *Evening Post* printed on Friday further evidence as to Dr. Scharf's method of operation: the tabulation of the vote in twenty doubtful districts in which the Catholics had considerable strength; the names of prominent Catholics in one of the California districts in which Senator Bard should have taken an interest; and the circular bearing Dr. Scharf's name which was circulated in support of Representative Babcock. If this last document be a cunning forgery by enemies of Dr. Scharf, he must admit that they worked along lines which he himself marked out. President Roosevelt cannot have known of the machinations lying back of the petitions for the diversion of trust funds; but Senator Aldrich and others who took a hand in the affair are not supposed to be as innocent as babes.

The Missouri Senatorial deadlock is evidently one that could be broken by the election of some other Republican than either Mr. Niedringhaus or Mr. Kerens. No such figure is yet even on the horizon, though Republican organs and politicians continue to urge the Legislature to elect somebody, if only to save the good name of the State. The situation of this "redeemed" commonwealth is in several respects extremely awkward. If the Legislature adjourns this year without a choice, it means a vacancy in the upper house at Washington for two years, since the Democratic Governor will certainly not call a special session for the sole purpose of choosing a Republican Senator. Then, in the election of 1906, the Senatorial issue could not be suppressed. As a Republican remarks in an interesting letter to the Kansas City *Star*, it would "centre about the question, 'Cockrell or not Cockrell?' Everybody knows what that means—it would be Cockrell, and goodbye to the Republican strength in Missouri. On that straight issue Democrats in every county—candidates for the Legislature and for county offices down to constable—would hang on to that fine old statesman's coat-tails, and he would pull nearly every one of them into office." The advocates of the popular election of Senators are not likely to find a better case for their argument than this. It can hardly be doubted that the people of Missouri would like to have Cockrell remain Senator. If they had had the chance, thousands of Roosevelt supporters would have split their tickets to vote for him, as they did to vote for Folk. As it is, some of the Republicans are already reported to be saying that it would be better for them to elect Mr. Cockrell outright and then make the next campaign on purely State issues, than to go down in certain defeat should the choice of the next Legislature hinge upon his return to the Senate.

One renegade citizen of the South has been caught up with. This man, a member of the merchant class of Cordova, S. C., so far forgot himself and his duty to the white race as actually to address a negro school, the Prince Institute. Naturally, the publication of this fact made every reputable white man shudder. The resultant outcry was so great that the offender, one Julian M. Smoak, confessed and published his apology in the Orangeburg, S. C., *Evening News*. Here it is:

> "I had left my place of business here on a business trip a few miles below; on returning I came by the above-named school and was held up by the teacher and begged to make a few remarks to the children. Very reluctantly I did so, not thinking that publicity would be given to it or that I was doing anything that would offend any one. I wish to say here and now that I am heartily sorry for what I did, and I hope after this humble confession and expression of regret that all whom I may have offended will forgive me."

We hope not. There are some offences quite beyond the pale. Other merchants of Cordova, P. B. Sanders, P. O. Smoak, and Smoak Brothers, evidently feel as we do, for they have published a card announcing that J. M. Smoak was the only white person who entered the school, and saying that they "are as anxious to see the colored race elevated as any people, but by all means let it be done inside the color line." Precisely.

Senator Raines's bill permitting women taxpayers in cities of the third class to vote on propositions involving the raising of a tax, aims at an act of simple justice. Women taxpayers already have this right in towns and villages of this State, under the law of 1901; they also have it in a number of the third-class cities. The Raines bill would therefore merely equalize the status of all women taxpayers in third-class cities—that is, in those whose population is under 50,000. As matters now stand, a woman owning property in both a third-class city and in a village can vote in the latter, but may be without any voice in the former. Most of the charters of the third-class cities give women the suffrage on tax-raising propositions as "residents," but in some cases they have been prevented from voting on the absurd ground that women, although taxpayers for many years and dwellers in their own homes, were not "residents" in the ordinary sense of the word! Naturally, there have been protests. Again, some cities allow husbands to vote as representing the property of the wives, and in others both husband and wife have this right. Obviously, there should be a uniform law. The suffrage asked does not give women the

right to vote for town, State, or national officials, but affords an opportunity to unmarried women and widows to defend their property rights when it comes to such questions as raising money for schools, electric lighting, water, and other civic improvements. The bill should receive prompt and favorable attention from both houses of the Legislature.

"When James C. Carter retires, he will make room for a thousand lawyers." This rhetorical exaggeration of Mr. Choate's conveyed a simple truth to which Mr. Carter's death gives fresh and poignant force. In losing him, we lose not only a chief ornament of the bar, but a great citizen. His range of learning and weight of character and dignity as a lawyer, combined with the loftiest standards of professional ethics, did more than the labors of a thousand ordinary men could do to exalt and honor his calling; while his zeal and services in the great public causes of his time were an example and rebuke to all timid or flabby citizenship. Who that heard his deep tones, "To the polls! To the polls!" summoning the electors to defeat by their votes a base politician's plot against the judiciary, can forget the thrill and impulse which his eloquence, vibrating with indignation, was able to impart? Happily preserved in vigor to a ripe age, Mr. Carter received in his life every tribute which integrity and extraordinary ability can command; and in his death there are many among the best of his own profession who will feel as if chariot and horsemen had been caught up out of their sight.

The fine brute majority that Mr. Balfour inherited from his uncle is, though reduced, still sufficient. This was shown in the rejection by Parliament on Thursday of Mr. Asquith's resolution to submit the fiscal question to the electorate. The debate brought out an interesting diversity of opinion. Mr. Balfour desired to prolong the present Parliament for the very good reason that he still commands a majority. Lord Hugh Cecil, since Mr. Winston Churchill's defection to the Liberals the most brilliant debater among the Free Trade Unionists, spoke for delay, because that would give time for fiscal agitation to die down harmlessly. Unionism, he maintained, was gradually purging itself of protectionist vagaries. Mr. Chamberlain, though for his own part he would welcome a general election, urged the Government not to resign simply to oblige the Opposition. Delay, he insisted, was doing the work of fiscal reform. He expected to see all the Free Trade Unionists converted to his plan. Evidently, if Mr. Balfour and the free traders of his party still manage to agree, and Mr. Chamberlain declines to oust his chief so long as the Liberals desire office, there would seem to be no immediate prospect of dissolution.

Anything that clears up the position of Mr. Balfour—"the great confuser," as Mr. Birrell recently termed him—is of importance, and Thursday's debate was notable for Mr. Chamberlain's reassertion that he and Mr. Balfour agree absolutely in principle, and differ only as to methods of procedure. In somewhat striking contrast to this clear-cut imputation of protectionist faith, was Lord Hugh Cecil's merciless scoring of his cousin for ambiguity, and Mr. Balfour's refusal to give "a monosyllabic" answer to the question, "Are you a protectionist?" The author of 'Philosophic Doubt' may have felt that he was being pressed too hard. Only the other day, at Mr. Morley's request, he committed his views on the fiscal question to "half a sheet of note paper." In this short space he reiterated squarely the demand for retaliatory duties made in his Sheffield speech, but continued with recommendations of some sort of tariff reciprocity with the colonies, some sort of a colonial conference, some sort of an anti-dumping policy Evidently, the official interpretation of such articles of faith could not be got into a word of one syllable, and Mr. Balfour did well not to make the attempt. Meanwhile, Mr. Chamberlain's rather arrogant claim that Mr. Balfour will be with the protectionists when he catches up, explains the somewhat lordly graciousness with which he declines to shorten Mr. Balfour's political life. This clemency obviously puts Mr. Balfour under palpable obligations of an embarrassing sort.

The distractions of the Russian Government were already near the endurance limit of human nerves. The hopeless confusion of political and industrial outbreaks in Finland, in Poland, in Batum, in all the great industrial centres; the protests of the bar and the universities against the "bloody Sunday"; the railroad strikes—were enough, with the demands of the Mantchurian campaign, to tax the energies of administrators to the utmost. At such a time, the terrorists have furnished a climax in the assassination of the Grand Duke Sergius—the fourth prominent reactionary violently removed in the past two years. Thus the reformatory overtures of the bureaucracy are answered by hurled bombs, and the agitation of moderate liberals is seized upon by the Reds for a renewal of the old programme. Clearly, on both sides almost insuperable obstacles are offered to gradual reform. The slaying of Sergius strengthens the force which he impersonated so odiously that a deed which promises little good and may involve great evils has evoked slight sympathy for the victim. Sergius was the natural target for a fanatic's bomb, yet he was himself the creature of the absolute system into which he was born, and deserves some of the pity felt for a great people driven, contrary to its nature, to a violent revolution. His taking off may have the effect of precipitating peace in the East, but the Government cannot yet be declared at the end of its resources for the maintenance of order. Highly significant on this point are the resolutions adopted by the remarkably outspoken and even menacing meeting of professors and students of the University of St. Petersburg on Monday, which concluded upon a suspension of all teaching until the autumn. While the preamble, it is true, speaks of the "criminal adventure in the Far East, which has cost the people tens of thousands of lives and millions of hard-earned money," the formulated demands neither begin with peace nor contain any allusion to it, but do invoke "a people's militia, in whose ranks all citizens can fight to realize our aspirations." At the front stands "a legislative assembly on the basis of a universal, equal, and secret ballot of male and female citizens."

Facts as to Russian military mismanagement are leaking out every day. We have not only the savage criticisms of the fleet by the officers who have returned with Gen. Stoessel, and attacks upon each other by the surviving admirals and generals. The *Écho de Paris* has been printing some statements as to the conduct of the Vladivostok fleet which it vouches for on the authority of an intimate friend of Admiral Skrydloff. According to this story, in which there is nothing improbable, Skrydloff was merely the nominal commander of his squadron, being in every way subject to Admiral Alexieff. Thus, Skrydloff did not hear of the sortie of the Port Arthur ships until twenty-four hours after it had taken place, although coöperation of the two fleets was of the greatest importance. Alexieff ordered Skrydloff into Port Arthur by way of Chefoo, but the Admiral refused, saying he might as well go by way of Nagasaki. Skrydloff reports that Kuropatkin also rejoiced when Alexieff was recalled, for the viceroy, in the General's opinion, had succeeded in botching the whole concentration. This was the inevitable result of putting a naval officer in supreme command of both the naval and military forces—from the first a fatal blunder. Now, we have Gen. Gripenberg's extraordinary insubordination in publicly blaming Gen. Kuropatkin while that officer is still commanding in the field. That the highest officers have begun to denounce each other in this way must give the Japanese renewed hopes of decisive victories at an early date. And must we not believe that this insubordination and disorganization have affected Rozhestvensky's fleet?

THE SAN DOMINGO TREATY.

Having been driven from his first plan of taking over Dominican administration, under what he considers his general police power for this hemisphere, the President has now submitted to the Senate a treaty with the same end in view. This is the legal and orderly process. The scheme should be considered on its merits—but it should be really considered. The Senate and the country should look into the matter closely, to see if what Mr. Roosevelt alleges to be an imperative national duty, truly be such; whether it is desirable either to take the immediate step he urges, or to erect the far-reaching precedent involved in it; whether, in short, the President's premises are correct and his logic convincing.

The treaty and accompanying message speak of "the Dominican Government" and its desires. What reality lies behind the phrase? Undoubtedly, there is a *de-facto* government in San Domingo; but its authority and stability are in gravest doubt, according to President Roosevelt's own admissions. For four years at least there has been a disputed Presidency and endemic revolution. How do we know that President Morales is not using us simply to enable him to triumph over his foes? Dominican custom-houses have for long been headquarters of revolution. Jiménez, or any other conspirator, had only to seize one, and a revolution was at once financed. It has been credibly stated that Monte Christi and its customs revenues were in a possession adverse to Morales, but we obligingly undertake to oust his antagonists. Indeed, his complacent surrender of all Dominican custom-houses has the look of a clever move to cut off the sinews of revolution, and establish himself at ease under the protection of United States guns. This certainly is an aspect of the matter carefully to be scrutinized. In Venezuela, our Administration is reported to be about to override a *de-facto* government on the ground that it is arbitrary. In that country we do not propose to allow ourselves to be fooled by an alleged "Venezuelan Government." But in San Domingo we speak deferentially of a "Government" which, for all we know, exists only on paper, and may be alienating national sovereignty without consulting the people, or even in defiance of their wishes.

Upon President Roosevelt's arguments from the Monroe Doctrine we will not dwell. Anything you please can be drawn out of that fog-bank. We simply note that Mr. Roosevelt now brings out of it conclusions diametrically opposed to those he maintained in 1902. This only shows, of course, that Monroeism is a kind of reflex of national emotion. When we want to do something very much, it is the Monroe Doctrine that furnishes convenient warrant. If we are violently opposed to any course, Monroe lays a dead inhibiting hand upon us, greatly to our relief and comfort. That is well understood. To draw logical inferences from the Monroe Doctrine is as dangerous as to construct a syllogism in which every term is undefined. But there are certain statements of fact in the President's message which come within the reasonable operations of the mind.

He argues that foreign nations have just debts against San Domingo; that the only way in which they could enforce collection would be by seizing Dominican custom houses; that, even so, the debts are "beyond the power of the republic to pay," and that hence what we are confronted with is the peril of a "permanent" occupation of Dominican territory by European Powers. But from this he passes easily to the conclusion that we, with our transcendent financial genius, could take over the custom-houses, quickly make the revenue equal to the discharge of every obligation, and then gracefully withdraw, not proposing to "take any part of San Domingo." Obviously, the two parts of that argument are at war with each other. If the first one is valid, then what we are driving straight at, in spite of all pretence to the contrary, is a permanent occupation of San Domingo. This, in fact, seems to be distinctly invited by Article 7 of the treaty, which contemplates, in addition to rehabilitating Dominican finances, our doing everything *we* may think necessary to "preserve order" and "increase the efficiency of the civil administration." Imagine any European nation getting such a blanket grant of power! Should we not all cry out that it meant the complete and permanent absorption of San Domingo?

Financially, the proposal is that we, as one creditor, should guarantee the debts of all the others. Why not an undertaking by all concerned? The President informs us that a plan of "joint fiscal control" was suggested in 1903 by one foreign government. This the United States "declined." Why? No reason is given. We have had part in such a condominium before. Why reject so natural a step by the parties in interest now? Another case of inflamed Monroeism, we suppose. But peril of complications in the process glares at one. Already the German press is remarking that the President's plan, far from composing the troubles, will aggravate them. The point is, that we are now to pass upon the justice of foreign claims against San Domingo. Some of them the President calmly asserts to be "improper or exorbitant." If he is to use such language of foreign governments, how long will it be before San Domingo will be forgotten in the rows with France or Germany or Belgium precipitated by our assuming to be a referee in Dominican bankruptcy?

Such considerations and others like them should be duly weighed by the Senate. The President urges haste, but the business requires rather the extreme of deliberation. It wears too close a resemblance to the farmer's wife who was driven so distracted by the hopeless accumulations of work in her kitchen that she "went blackberrying." Our own affairs demand all the financial and administrative talent we have to spare, yet we may be sure that the San Domingo precedent will be seized upon by every tottering and revolution-harried republic of Central and South America. If the treaty goes through without serious amendment and rigid safeguarding, the effect will be the same as if a shingle were hung out at the White House: "Uncle Sam, Receiver in Pan-American Bankruptcy and Universal Antidote for Anarchy."

THE EQUITABLE CONTROVERSY.

The one patent fact in the action taken by the Equitable Life directors on Thursday is, that the situation whereby control of the company and its assets is practicable through ownership of a bare majority of its $100,000 stock, may be altered through transfer of this power to the policy-holders. Both factions in the recent contest recognize that the company's position will be strengthened and secured by conceding to policy-holders a voice in electing the management. The right to such participation, in the case of joint-stock companies, is in some dispute, and apparently could not be won with the board of management hostile to the plan. The Equitable controversy will be particularly useful, then, if it impresses on the public and the legislative mind the necessity for such a safeguard in the case of all life-insurance enterprises. To prove this does not require proof of incompetency on the part of any existing management. Based on control of a small majority of stock, such management may be ideal; yet death, business emergency, or high bids from other capitalists, might shift the control into hands either incapable or untrustworthy. That such a possibility should exist in an enterprise where withdrawal by the people vitally concerned is, to all intents, impracticable, hardly conforms to modern ideas; but there is no way of averting it save by granting to bona-fide policy-holders of such companies a potential veto on the acts of the management. This is the reason why the courts have tended of late towards recognition of rights on the part of patrons of life-insurance companies different from and superior to the rights of a bank depositor. Explicit admission of the same right by a company which has so long asserted the simple joint-stock principle in insurance, will have a very salutary effect.

It does not, of course, follow that this transfer of control will result in radical changes of personnel or policy. Even in the case of life companies operated from the first as mutual enterprises, such changes are very rare. With the enormous number and wide distribution of the policies embodying ultimate ownership of such companies, any management under whose auspices the enterprise has prospered is virtually assured of reëlection. This is undoubtedly for the best. Nothing could be more injurious to the business of such a corporation than constant change of officials; and in case of actual and proved mismanagement, appeal to the policy-holders always remains as a possible corrective.

An arrangement to "mutualize" the Equitable Life became inevitable from the moment of a contest for control between two or more rival factions. It would have been no solution whatever for the majority holdings of the stock to have been sold at a fancy price to other capitalists. No greater calamity to the insurance business can be conceived than the invasion of its field by the snatching and grasping methods which marked our railway and industrial company finance of 1901 and 1902. If the present situation, in which one individual dominates through ownership of a bare stock majority, was no longer safe, and if the alternative of bids for his holdings by rival interests, each with its eye on the company's huge assets, was inadmissible, the only possible recourse was that which the directors have adopted.

We do not doubt that the decision to invest control in the Equitable policy-holders will have good effect. At the same time, it seems to us that the matter cannot stop wholly with that. Executive officers who were reëlected last week have made certain distinct and positive statements, under their official signatures, as to a necessity for change in the composition of the board of management. The President of the company declared in terms that failure to make such change "would be most prejudicial to the welfare and progress of the society and the conservation of the trust funds held for the benefit of our policy-holders." We do not assume to pass judgment on the accuracy or inaccuracy of this formal official statement, but, after publication of such an utterance, the reëlection, both of the officer who was responsible for it and of the officer at whom its criticisms were directed, composes nothing. If the statement signed by Mr. Alexander was exaggerated, in the heat of a canvass to force the board of management to the mutualizing expedient, then it ought to be modified or retracted. If it was strictly accurate, something more should be said, in common justice to the company's policy-holders, as to what steps the present management means to take with a view of ensuring proper correction of past evils after the mutual plan shall have been formally adopted.

We do not suppose that these considerations are absent from the minds of the gentlemen now representing the Equitable before the public. But it is essential, in our judgment, that the nature of the situation and the nature of the remedy should be made absolutely clear. The question at issue is not a mere dispute over methods of management in a single institution; it affects the position of all other life companies and of their policy-holders. To stir up a controversy of this sort, only to drop it and leave matters precisely where they were before, would be a piece of fatuity and recklessness quite on a par with the exploits of Mr. Lawson; and it could have no other consequence than to create uneasiness and misgiving among holders of life-insurance policies throughout the country. This large and grave aspect of the matter obviously supersedes all considerations of "harmony" in the board of the Equitable or of any other company, and we believe that its importance is recognized by the principals in the pending dispute. It is fortunate that, with the plan for reversion of control to the policy-holders fairly under way, it will be entirely feasible to thresh out such questions without frightening investors in the company, and leaving them in a feeling of helpless insecurity.

THE CONDITION OF THE ENGLISH SAVINGS BANKS.

For many reasons, the modern tendency to enlarge the functions of Government ought to be sturdily resisted. There are no steps backward: movements in this direction are irretrievable. No ruler willingly surrenders power; every officeholder will fight to keep his place. Were governmental administration wise and economical, we might rejoice in it; but it is apt to be both wasteful and stupid. When it is proposed to commit some new department of activity to the charge of Government, the public is assured that reforms will be introduced and improvements made. What usually happens is that the new bureau falls into the old ruts, that abuses creep in, that the promises of improvement are not fulfilled, and that the persons interested in maintaining these conditions are able by combination to defy criticism and prevent reform. The history of the Post-Office Savings Banks of England illustrates these truths. Men conversant with finance have for some time understood that the assets of these banks were less than their deposits, but the particulars of the situation have not been explained. They are now, however, clearly set forth by Mr. Alfred Marks, in the *Investors' Review*, and our people may well take warning from his disclosures.

Prior to 1861, when the Post-Office Savings Banks were established, the deposits of the existing, or "Trustee" banks, had been invested by law in Government securities, to the great convenience of the Treasury. This convenience, indeed, was one of the reasons which led Gladstone to favor the establishment of the post-office institutions. A steady income was thus turned into the Treasury, which could be employed for any purpose, and which constituted a loan from creditors who were not likely to make any sudden demand for their money. But Gladstone declared that "it would be absurd for the Government and Parliament, even for the purpose of encouraging provident habits among the poor, to make the working classes of the country pensioners on the Exchequer." The rate of interest allowed on deposits was therefore fixed at a rate which the deposits earned. Moreover, to provide for any depreciation, the act of 1861 declared that when the fund in which the deposits were invested became insufficient to meet the lawful claims of depositors, the Treasury should issue the amount of the deficiency out of the Consolidated Fund. The meaning of "insufficient" was defined by later acts relating to Trustee Banks. They were directed to prepare balance sheets showing the market price of their assets, and in case of any deficiency the Treasury was directed to certify the amount thereof to be a charge on the consols. Such deficiencies, being found to exist, were accordingly so certified.

Before the madness of imperialism involved England in the Transvaal war, the Post-Office Banks had not shown a deficiency, the price of consols rising steadily. That ruinous enterprise, however, greatly injured the credit of the Government, and for some five or six years the balance has been against the banks, and in 1904 their assets were less than their deposits by over £11,000,000. The deposits were about £147,000,000, and the stocks held equalled about 18s. 6d. in the pound. But the Government has taken no steps to provide for this deficiency. On the contrary, it has had passed an act which dispenses with the publication of a balance-sheet, following the example of some of our companies which think to conceal their embarrassments by suppressing their reports. As the Assistant Secretary of the Treasury naïvely replied to a question asked in Parliament, any one can make any valuation of assets that he likes. It is needless to say that such a proceeding on the part of private individuals calls forth the sternest condemnation from legislators. Such proceedings, however, are precisely what legislators have constantly resorted to in the past, for the purpose of deceiving the public and concealing their own mismanagement. But that the British

Government should in these days resort to them gives us a painful shock. We should not have looked for them even from the present Ministers.

Let us compare this situation with that of the five great joint-stock banks of London, whose deposits at the close of 1903 amounted to £147,720,000, those of the Post-Office Banks being £146,000,000. Against these deposits the joint-stock banks held a reserve of cash, in hand and in the Bank of England, of £26,583,000. They had also over 18 millions of cash "at call," and 95 millions in bills of exchange. They had, besides, 28 millions of Government and other securities, and they had marked down their consols to 85, less than the market price. But the Post-Office Banks have no reserve at all, and no cash on hand except their daily receipts. They are sustained by the guarantee of the Government. No one doubts the value of this guarantee; but, as a matter of fact, the money of the depositors has not been invested by Government, but spent. Their £146,000,000 has been swallowed up, and their sole asset is the good faith of the Government. That is a good asset; yet, if England became involved in a great war, its credit, already impaired, would seriously decline. Probably there would be no "run" on the Post-Office Banks; but, if there were, it might not be easy to stop it. Large quantities of consols might be salable, in a panic, only at a heavy discount.

The rate of interest allowed on deposits was fixed by Parliament, in 1861, at 2½ per cent. At that time the rate on consols was 3 per cent., but this has been reduced to 2¾, and recently to 2½ per cent. As much of the stock held by the banks was bought at a premium, it brings in less interest than the depositors receive, allowing nothing for the expenses of administration, which, in a business of this nature, are necessarily considerable. At first no one was allowed to deposit more than £30 in a year, nor more than £150 altogether. The limits were raised in 1891-3 to £50 and £200, and accounts may be kept in the names of different members of the same family. Mr. Marks calculates that, in 1902, one-tenth of the depositors owned two-thirds of the deposits. In 1857, some 70 per cent. of the deposits belonged to 95 per cent. of the depositors. Evidently these banks are extensively used by persons of considerable wealth, who observe that they would get only about 1 per cent. on their money if deposited in a joint-stock bank, and naturally prefer to take advantage of the Government rate. Any attempt to lower this rate to a proper figure would arouse the opposition of this class. The sympathy of the public would be asked for the poor workingman, and it is altogether improbable that the rate will be lowered. A tottering administration would not dare to do it for fear of bringing about its own fall, nor an incoming administration for fear of hurting its prestige. At present the "enormous evil," as Mr. Gladstone called it, of making the depositors pensioners on the Exchequer, has come to pass, although these pensioners are rather of the middle than the working class.

Depositors in the savings banks of this country may justly think their position better than that of the English, and much better than that of the French and Australians, whose savings have practically been impounded by their governments. We know that our savings have not been wasted in killing human beings and destroying their homes, but have been invested in productive enterprises. They are secured by collateral which has not depreciated, and which, if it tends to depreciate, is disposed of. They do not have the promise of the general Government that it will secure them against loss, but they have the ability and integrity of the best of our business men as a pledge that the trust reposed in them will be faithfully discharged. They have the satisfaction of reflecting that the interest which they receive has been honestly earned, and not paid them as a pension by their fellow-citizens. They know, too, that interest will not be paid when it has not been earned, and that, instead of a deficiency of assets, there exists a fair surplus—in spite of the taxes which our legislatures insist upon imposing. If they are wise, they will take warning from the case of England, and resist all attempts to commit industrial enterprises to the charge of rulers who are selected, to say the least, without reference to their integrity and capacity as business managers.

THE WINNER IN THE CHARIOT RACE.

It was the evening of election day, after a fiercely contested campaign. One of the aspirants for office was reading in his study, when his secretary entered with tidings of the struggle. "Well," said the statesman cheerfully, "how large a majority have they given us this time?" When the secretary broke the sickening news of disaster, the disappointed man, unperturbed, took up again the tale of 'Ben Hur.' *Abeunt studia in mores.* The death last week of Gen Lew Wallace raises the question why 'Ben Hur' was better than bromide to steady the nerves of a defeated candidate, and why the book has had such enormous popularity. Throughout the rank and file of our steady, church-going people the man who is ignorant of 'Ben Hur,' who cannot recall vividly every point of the chariot race, is set down as beyond the pale, in both literature and religion. Shakspere and Milton are above the range of honest folk, who are often content to take the Bible at second-hand; but 'Ben Hur' brings grandeur near our common dust.

Matthew Arnold had much to say about "the grand style." For hundreds of thousands of readers Lew Wallace is the inventor of the grand style. True, these modest critics live in what such superior persons as Arnold call Philistia, but they buy books by the ton. When they find an elaborated manner which is gorgeous with Oriental imagery and suggests a fusion of 'Marmion,' 'The Decline and Fall of the Roman Empire,' and the Bible, and which, in the more notable passages, is rhythmical, they exult in having discovered the real thing, and they are justly proud of their discernment. Take this:

> "Out flew the many-folded lash in his hand; over the backs of the startled steeds it writhed and hissed, and hissed and writhed again and again; and, though it fell not, there were both sting and menace in its quick report; and as the man passed thus from quiet to resistless action, his face suffused, his eyes gleaming, along the reins he seemed to flash his will; and instantly not one, but the four as one, answered with a leap that landed them alongside the Roman's car."

A man who can thrill at such sentences as these can surely spend his hours happily and unconsciously while waiting for the gallows.

The style, however, is merely the gilded vehicle for characters and incidents which make a dime novel about bandits and beauties seem dull and lifeless. The Queen of the Outlaws is nowhere when "Esther's eyes were dewy with tears." Jesse James is a divinity student in a white choker when compared with Messala, who, in spite of his "air of passionless hauteur characteristic of the fine patrician face," was "cruel, cunning, desperate, not so excited as determined—a soul in a tension of watchfulness and fierce resolve." And for your high-souled, dauntless hero, we back Ben Hur against any combination of Old Sleuth and Crimson Dick yet presented to the world. There is also enough and to spare of battle, murder, and sudden death. Perhaps Lew Wallace could not have written up to the latest specifications for an historical novel—a hair-raising sensation in every five pages; but, for the benighted days of 1880, when the art was yet in its infancy, he far surpassed the wildest expectations. The most intensely respectable man that ever passed the plate for the missionary collection got his money's worth when he paid $1.50—the "Garfield Edition" in three-quarter levant, $10.00—for a book that recalled the fearful joy of reading behind his geography the shabby, yellow-covered guide to a forbidden paradise.

Above all, 'Ben Hur' gives us Crimson Dick, Old Sleuth, Jesse James, and the Queen of the Outlaws combined with the strongest religious influences; it is as edifying as a prizefight in a Young Men's Christian Association — unrestrained excitement and profound piety.

The sub-title, "A Tale of the Christ," would alone have sold two of the dullest books ever written, Becker's 'Gallus' and 'Charicles'; it made 'Ben Hur' a household word. From 1885 to 1900 no church entertainment was complete unless the local amateur elocutionist let herself go on the chariot race. Nobody who went to Sunday-school could have escaped the story had he tried. Whenever the class reached the life of Christ, the teacher read that chapter of 'Ben Hur' beginning, "A mile and a half, it may be two miles, southeast of Bethlehem, there is a plain separated from the town by an intervening swell of the mountain." Superintendent, pastor, and stray visitor, called on for a few remarks, reminded everybody at least once in three months that the most vivid picture of the Holy Land in the time of Christ was in 'Ben Hur.' "Now, dear children"—so the talk began—"I always warn you against novels. But there is one work of fiction drawn very largely from the Bible. Though there are a few happenings that may have been invented, the great bulk of the work is as true as the blessed gospel itself. I mean 'Ben Hur, a Tale of the Christ.' I can recommend it strongly as full of spiritual refreshment. We have two copies in our own Sunday-school library. It is spoken of most warmly by the bishop and the editor of the *Christian Advocate*."

The very stars in their courses fought for 'Ben Hur.' Its descriptions of Palestine and its religiosity won it eager readers among the millions who were bred to regard novels as hell broth. To minds nourished upon Todd's 'Lectures to Children' and 'Hints and Thoughts for Christians,' with the Lucy books reserved for a special treat—in short, to all who knew that sharp and unmistakable distinction between Sunday and other reading, the pages of 'Ben Hur' were like cold water to a thirsty soul. People of wide reading are naturally inclined to sneer at the meretricious qualities of 'Ben Hur' while they stick to 'The Ordeal of Richard Feverel.' 'Ben Hur' was never meant for them, but it has gone straight to the heart of the solid Puritans, who, thank Heaven! are still the backbone of America.

UNION AND CONFEDERATE FORCES.

The very latest reminiscence of the civil war, Colonel O'Ferrall's 'Forty Years,' recites that "the North was able to put in the field 2,700,000 men, the South only 600,000 men." Standing by itself, such an estimate would be of little consequence; but it does not stand by itself. That measure of the Confederate forces has been in vogue since 1867, and it is acquiring a pseudo-historical value. Thus, the Confederate Handbook, 1900, avowedly designed to furnish "reliable information for the use of the future historian," insists that the enrolled strength of the insurgent army did not exceed 600,000 men, while no more than 400,000 were ever available for the field. Another alleges that "this estimate is engraved upon enduring monuments in the South," and the figures "are printed in the Southern school-books," thus perpetuating serious historical error should it not be the truth. Very recently Mr. Cazenove G. Lee, in a newly-published table designed to show the enormous numerical superiority of the Union army, credits it with 2,778,304 soldiers as against the same 600,000. Such statements are unobjectionable if they are true; but the probabilities are all against their truth, for there is much presumptive and statistical testimony to impugn their accuracy, and there are no consolidated Confederate records to sustain them. In 1900, before the Confederate Handbook appeared, Colonel Thomas L. Livermore, lately of the Eighteenth New Hampshire Volunteers, published an admirable discussion of the situation in 'Numbers and Losses in the Civil War,' reviewed in No. 1844 of the *Nation;* and at the November, 1904, meeting of the Massachusetts Historical Society he examined Mr. Lee's and the Handbook's figures, which seem to be identical.

The overwhelming superiority of the loyal States in number and in material wealth has never been in question. The disparity was so great that the minority was foredoomed if the two parts of the common country put men in the field proportionately to their population. Secession's reliance, apart from possible intervention, was upon divided counsel and lukewarm defence of the Union, which might so far equalize the numbers in the field that an armed contest, if indeed there should be such, would not be hopeless. For the matter of that, it seems that the assumption in Beverley Tucker's 'Partisan Leader' was accepted by the disunion managers as infallible prophecy of an unmolested withdrawal of the Cotton States. Mr. Davis's advertisement, that all the new Confederacy wanted was to be let alone, sounded as an echo of that fantasy. It is demonstrable that on the Union side "there were in fact 2,898,304 army and navy enlistments." The point to estimate is how many men supported the Confederate cause in the field. It is necessary to estimate the number, because there remain no official summaries.

In 1890, after twenty-five years of peace, the census showed 432,020 Confederate and 980,724 Union survivors, or a little more than one to two and a fourth. If the Union enlistments account for 2,300,000 individuals, as is probably the case (for it is certain that many of them represent very short-term and other discharged men who reëngaged), then the Confederate survivors indicate an original force of more than 1,000,000 men on the assumption that the mortality rates were alike. But it is certain that the deaths of Confederates on the field were not only relatively but absolutely greater than those among the Union troops, and, from conditions not necessary to recapitulate here, the mortality from disease also was much higher. If the number of individuals in the Union army corresponds more nearly to the number of enlistments, then the number of Confederate survivors represents a proportionately higher number of arms-bearers.

In the Confederate ranks, enlistments and soldiers much more nearly corresponded, for there was no relaxation of the military grasp except where disability occurred. It is in evidence that the conscription, which arbitrarily prolonged the service of those voluntarily enrolled in the first year of the war, finally ransacked the seceding States from end to end with bitter constraint. The military age was gradually extended until in February, 1864, it ran from seventeen to fifty; and the exemptions were so few that, a year later, the entire number east of the Mississippi was 87,863. After youth and age had been ravished from their homes, the blacks themselves were about to be put under arms and in the ranks when the crash came. That such a trial to Southern sensibilities was ever dreamed of, is the best evidence that no white reserves were left. With a country swept as clean as that, the men in the ranks certainly exceeded 600,000 out of the 1,440,000 men of the conventional military age who, Col. Livermore shows, were probably available, plus those beyond the normal fighting years drawn upon by the conscription. There is official reference and plenty of popular testimony to lads of sixteen and less being drawn by the spirit of the times into the track of war, and without doubt men more than fifty years old were in the ranks. Further, although the general conscription records were destroyed by authority, there is a surviving statement from that bureau that in January 1864, fifteen months before the end of the war, 566,456 men had been in service from Virginia, the Carolinas, Georgia, Alabama, and Mississippi. If six States put more than 560,000 troops in the field, as they certainly did, before the war was three-fourths over, a total of 600,000 would leave less than 40,000 for all the other territory during the four years, and for that central region during the remaining year and a fourth—which reduces assertion to absurdity. But, in fact, it was after this date that the conscription ages were extended, and to the official muster rolls already cited must be added the later recruits from these very States, 296 regiments from the other States belonging to or having sympathy with the Confederacy, and 98,000 men who were in certain irregular organizations. Irrespective of the arithmetical fallacy, to limit its soldiers to the familiar and indeed paltry 600,000 is a practical denial of the boasted unanimity with which, either freely or by compulsion, disunion was supported.

Along with this persistent error is the equally persistent misapplication (to lay no greater stress upon it) of the terms in which the military field returns were prepared. In the United States forces, all men neither absent nor sick were accounted present for duty. But a considerable proportion of these had to be employed on other necessary service than that of the firing line. The Confederates made a distinction between the able-bodied men present, by classing those available in action as "effectives," and reckoning them alone as their battle strength. But the Federal returns are always used at their face value by the Confederate historians, so that the odds against which the effectives fought are unduly magnified. The facts are not changed, but appearances are altered. In the latter part of the war, at least in the Army of Northern Virginia, it was forbidden to publish among the casualties the slighter wounds; doubtless partly to avoid depressing the civil population and the army itself, and partly not to encourage the enemy.

Col. Livermore's paper, which appears irrefutable, ought not to remain buried in the Proceedings of any Society, however notable. It is a valuable contribution to American history, and deserves a distinct investiture for convenience of consultation and study. The distribution among all the libraries of the land of a special edition of this analysis would be a service, in the interest of historical truth as well as of patriotism, which independent or incorporated wealth might well consider.

CURRENT ITALIAN FICTION.

ALASSIO, January, 1905.

Ten years ago it seemed as if a splendid efflorescence of the novel had begun in Italy. Fogazzaro, Rovetta, Matilde Serao, Gabriele D'Annunzio had all given proofs of their strength; De Roberto had just published 'I Viceré,' and Capuana 'Le Paesane.' There was still hope that Verga would continue his series of "I Vinti" with the promised 'Duchessa di Leyra,' while there was plenty of talent among the novelists of lesser note, and brilliant promise from some of the newcomers. Time has passed, but the bright morning has given place to a dull sort of a day—nothing, perhaps, to complain of, except that it is not at all equal to our expectations. There are new novels enough published, and by writers whose names were utterly unknown ten years ago; and here and there one who, with his youthful courage, has brought to his work good brains, and yet the survey of the field of fiction is to-day, as a whole, rather depressing. The cheering exceptions are chiefly among the tellers of short stories. For to-day I mean to confine my attention to these. It is somewhat like picking the plums out of a pudding, but if later it should turn out that what remains is too insipid, you will pardon me if I do not offer it to you.

Gabriele D'Annunzio contributes a volume which I believe is not really new, called 'Le Novelle della Pescara,' stories of the author's birthplace in the "Abruzzo forte e gentile." If one were to judge by these tales, heaven did *not* lie about him in his infancy. In reading them I found that, as regards the matter, nearly all came under one or more of three categories, and I marked them accordingly—gruesome, erotic, or disgusting. Instead of men and women, the pages are peopled with caricatures that the author seems to have drawn sometimes in hatred, sometimes in contempt, never in love. With few exceptions they are hideous; and as in general their actions are no better than their looks, the effect of a continuous reading of the book is like that of a nightmare. At first one wonders at the Olympian calm of the narrator in the midst of so loathsome a world, but little by little one perceives that his preoccupations are literary rather than human. His *fantoches* have a certain distorted resemblance to life; but then, after all, they are only *fantoches*, and a little attentive observation reveals how the wires are pulled, and also that the show is but a reminiscence of another given by an antecedent showman. One need not look far for an example. The second story in the volume, "La Vergine Anna," is obviously inspired by (one might even say, imitated from) 'Un Cœur Simple' of Flaubert. The same subject treated in the same manner, even to the suppression of every adjective not absolutely necessary to the proper telling of the story; and as far as the manner is concerned, the success of the imitation is beyond question. Occasionally the author's power of presenting a scene, barely more than suggested by a few sober touches, makes it seem that one is reading an Italian Flaubert. The illusion, however, is but fleeting. Flaubert, impassible as he appears, must have loved his Félicité, for there is scarcely a detail relating to her in his pages that does not bring into stronger and stronger relief her humility, her unselfishness and loyalty; whereas, D'Annunzio has no love for his Anna; and no wonder, as the one characteristic he is at great pains to show is her imbecility. The result is that, for want of human interest, the reader gets bored, especially as many of the details, consigned, after the manner of Flaubert, to short sentences, are of a surprising puerility.

And so with the rest of the book. In the matter of execution it leaves little to be desired; it is sober, with an absence of the lyrism, poetic cadences and the jewel-wrought diction of much of D'Annunzio's later work; but there is always that tantalizing suggestion of the author's reading, as if he were less taken up with the telling of a story about his fellow-townsmen than with the telling of it in the manner of some writer who has excited his admiration. But if the manner is a success, one can scarcely say as much of the matter. One tale, for instance (a spurious Maupassant, quite recognizable in spite of the heavier touch), would seem in its crude loathsomeness intended to bring his model into disrepute. The art is nearly always employed to delineate a collection of horrors, of deformities and diseases. Strange that writers should be so slow to learn that pages of minute description of blemishes, to the last wrinkle and the last wart, may provoke a feeling of nausea in the reader, but do not necessarily evoke for him a living portrait. Then there are reminiscences of one or the other of the ancient *novellieri*, that are by way of being gay, yet are of a grossness which the historic sense helps one to tolerate in the old chronicle, but which is simply repulsive in a narrator of to-day. And the author's conception of fun! No trace of sense of humor is to be found anywhere in the works of D'Annunzio, but he need not have been at such pains to demonstrate its entire absence in his intellectual make-up.

Never, perhaps, were qualities and defects more puzzlingly interwoven in a writer than in D'Annunzio. Happily 'La Figlia d'Iorio' has lately come to show that he has always the power of doing beautiful things. This, indeed, is not the place to give an account of the work. Critics in general have vaunted its dramatic qualities, but it appears to me that its success upon the stage has been owing rather to the beauty and dignity of the poetry, to a certain atmosphere which he has created and which lends enchantment to the scene, and perhaps a little also to its picturesqueness as a spectacle. It reads charmingly.

'Casta Diva' is the title of a volume of stories by Gerolamo Rovetta. In point of readableness Rovetta is, if not first, at least among the first half-dozen of living Italian novelists. His style is clear and animated; his personages move with a very pretty resemblance to life; his descriptions, without being overdone, are sufficient, and the same may be said of his psychology. With so many qualities—and there are more than I have named—one wonders why one does not take him more seriously; why a writer so extraordinarily clever should still seem to halt this side of the highest achievement. You are amused, you are delighted, with the keenness of his perceptions; you are also impressed when he is earnest, but—and there, perhaps, is the rub—I doubt if you are ever deeply moved. In the midst of a not very admirable world, which, however, strikes you as being amazingly real, there move certain figures, generally those intended to be of a higher order than the rest, and these rarely seem other than somewhat sentimental conventions. They introduce an element of falseness into a society that you otherwise accept as authentic. Of course these observations do not apply to every one of Rovetta's works; in some of them there is a happy adaptability of the means at his command to the end he has set himself; and 'Casta Diva' is one of these.

Ugo Ojetti, always entertaining as critic or traveller, was not so fortunate in his earlier essays in fiction. He was dismal in 'Il Vecchio' and perilously near to maudlin in 'Il Giuoco dell' Amore.' In 'Le Vie del Peccato' he has left such performances well behind him. The stories are attacked and sustained with spirit, and are far and away the best things he has done. Of course for Sig. Ojetti there is but one sin worth telling about; it is that which all have committed, or will probably commit to-morrow or next day. To deny the soft impeachment is evidence either of hypocrisy or inexperience. But granting that the book is not "virginibus puerisque," it offers excellent reading for all (and they are many) who are interested in the ways that lead to the divorce court. A succeeding volume, 'Il Cavallo di Troja,' has an occasional story about other subjects. While these are often pleasing or interesting, it must be owned that the real successes of the author are in the field he has made his own, and where one cannot invite the young folks to follow him.

The volume of Fogazzaro entitled 'Scene,' although containing three pieces in form of drama, two of which have indeed tempted fortune upon the stage, has still its right to a place with the story books. In 'Il Garofolo Rosso' and 'Il Ritratto Mascherato,' no less an authority than Giuseppe Giacosa thought he discovered scenic qualities of so high an order that he persuaded the author, much against his judgment, to give them to the theatre, where they failed. "À quelque chose malheur est bon," and Fogazzaro's want of success bore fruit in a long and pleasant article in the *Corriere della Sera*, wherein Giacosa confesses himself convinced by the logic of circumstances—that is, he remains of the same opinion still. And one may agree with him that the dialogue of the 'Garofolo Rosso' is of an excellent quality for the theatre, albeit written in the dialect of Vicenza, and that the action of the 'Ritratto Mascherato' is so "brisk and efficacious that the most practised playwright might envy Fogazzaro its invention." But if I may oppose my poor judgment to that of a master like Giacosa, and if I may be pardoned for being so wise after the fact, I should say that a deathbed so madly comic

seems to me calculated to bewilder any public made up, as a public always must be, chiefly of persons whose convictions, prejudices, and affections are not flexible enough to adapt themselves readily to these "most singular scenes, in which physical suffering, anguish, baseness, and death have the ways and language of pure comedy." Even in reading, in the midst of the gayety of the *danse macabre* the catastrophe comes as a shock that is, to say the least, disconcerting. And yet the piece is so original, so audacious, the personages are evoked with such vividness, the satire is so keen, and the grim drollery is so genuine, that one would need to be very dull not to enjoy it. The other two pieces of the volume, great as are their merits, seem at first commonplace in comparison. This impression is but momentary. The 'Ritratto Mascherato' contains one of the finest women Fogazzaro ever drew, and that is saying a great deal, if one recalls merely Elena in 'Daniele Cortis,' Luisa in 'Piccolo Mondo Antico,' and Jeanne in 'Piccolo Mondo Moderno'; while 'Nadejde,' with the one exception of the title character, presents such a group of living and breathing men and women as the author himself has never perhaps brought together. The volume is, indeed, for interest one among the first half-dozen of all that I have had to examine.

It is five years since Edoardo Calandra published 'La Bufera,' which remains one of the best novels of our time in Italy. It has as yet had no successor; the volume entitled 'La Falce,' which appeared about two years ago, and in which the first tale fills by far the greater part of the volume, and might, by bulk, be called a novel, cannot take rank with its predecessor. It is in every way a slighter performance. And yet it can boast many of the qualities of 'La Bufera.' There is a slight similarity between the two stories, in so far as the protagonist, a man of birth and education, chooses his wife in a station that is not his own. And there the likeness ends—or no, the two works are akin in the delicacy and distinction of their art. I should say that Calandra writes like a gentleman, were it not that gentlemen do not, as a rule, write like Calandra, more's the pity. In part, it is the refined simplicity of the man whose story he tells, and who naturally reflects always the character of the writer; in part it is the love of nature everywhere apparent, and the succession of charming landscapes evoked by the slightest touch; in part it is the style, of singular limpidity, directness, and harmony, that create a sort of sympathetic air which envelopes the narration and the narrator. Reading 'La Falce' is like visiting rural Piedmont in very good company.

The readers of the *Nation* already know, at least by name, the authors of whom it has here been question; but there are also plenty of newcomers, and, of course, many collections of tales quite clever enough to justify the kindly reception they have received from the Italian press and also to repay the stranger for the time he may spend in reading them. Such, for example, is 'Rigoletto,' by "Térésah," freshly and pleasantly written, and singular in that it presents us with some humble Neapolitans (in whom I believe) so compounded of all the agreeable virtues that the ordinary traveller, who thinks he knows and is sure he despises the people of that wonderful city, will rub his eyes in perplexity, and perhaps impugn the veracity of the author. Such, too, is the "Fumo e Fiamma" of Domenico Tumiati, or 'Cavalleria Forzata' (stories of the theatre) of Nicola Guerra, or many another, the mention of which would be thankless, since my space does not allow me to do justice to their merits.

The case, however, is quite different with three of the volumes that lie before me. 'Trionfi di Donna,' by Alfredo Panzini, although, as the title indicates, all the stories are connected by community of subject, illustrates this by great variety in the inventions. The author has a pleasing vein of sentiment and an elevated conception of life and character, which implies that he is not an uncompromising realist. 'Il Trionfo di Puccin' and 'Il Trionfo della Penna d'Airone' are perhaps the best stories in the book, but there are two others which may interest Americans as showing how some of our rich countrymen look to Italians. The picture is not flattering to us; but, while we may hope that "mister" Douglas is of the author's own fabrication, one must own that in "Mrs. Evelyne" (her full name is Evelyne Taylor) every stroke in the portrait is copied from life. The spelling of English words is not impeccable—it scarcely ever is, and that not merely in Italian novels, but even in the most authoritative prints: "mister" Douglas is a "jankee" from "Nuova York" or "Nuova Yorck." Even the cosmopolitan Ojetti, in the first story of the 'Vie del Peccato' (another unflattering portrait, this time of an American girl), after making a steamer leave from "Oboken" and have a "deck-stewart," gives the following delicious sample of his heroine's English: "Would you accept a little flirt with your American pupil, would you not?" The popular writers of no country are infallible linguists; lady novelists in England used to have a high reputation for a fondness for eccentric French, and the French daily press, to say nothing of our own . . .! But the Italian, for some reason or other, is so constantly luckless in his liberties with our tongue that nothing would be easier than to make an amusing supplement to 'English as She Is Wrote' from almost any periodical of the country. I except *Minerva*, and, of late, the *Nuova Antologia*.

'Il Prisma,' of Italo Mario Palmarini, deserves to rank among the best works in the little mass before me, if only for three of the eight *novelle* composing it—"Un Vinto," a strong story, notwithstanding that the ending seems unequal to the rest of it; "Le Categorie di Don Ambrogio," dedicated to Luigi Pirandello, and in vivacity and humor worthy of that master; and "Musica Sacra," delicate and poetic.

Luciano Zuccoli first became known to me through a novel published about a year ago, entitled 'Ufficiali, Sottufficiali, Caporali e Soldati,' of which I may on another occasion have something to say. It was, without doubt, one of the most entertaining books of its year, and served as recommendation to the collection of stories published a year later under the title of 'La Vita Ironica.' It is enough to say that this last does honor to the introduction, and, were it only for the opening tale, "L'Ingenuo," or perhaps even more for another, "Il Ladro," deserves mention among the best that it has been my fortune or my duty to read of late. The author, if not a soldier, shows in his writing all the qualities that adorn the ideal man-of-arms. He treats lightly, indeed, certain conventions of ordinary society; but, in a style that is simple, forcible, and direct, he reveals himself generous, high-minded, impatient of all that is mean, and a lover of fair play; and these moral qualities impart a directness and simplicity to his narration that engage the reader from the very outset.

It only remains for me to mention four volumes, all by one hand, that are, however, sufficient to stamp their author as among the first of living Italian story-tellers. I am even tempted to assume the risks that beset the literary prophet, and assert that certain of these tales will always hold their place among the best in the language. The volumes are 'Beffe della Morte e della Vita' (two series), 'Quand' ero Matto,' e 'Bianche e Nere,' by Luigi Pirandello. From the scenes of most of his stories one concludes that the author is native of that part of Sicily which looks toward Africa. Ah, these Southerners—D'Annunzio, Capuana, Verga, De Roberto, Serao, Deledda, and now Pirandello—the field of contemporary Italian fiction would make but a meagre show without their creations! It is true that two of the number count only for what they have given us in the past, but the latest comer promises to vie with D'Annunzio in fecundity, so that, considering the long intervals which most Italian authors put between their published works, the quantity of production still remains overwhelmingly in favor of the Southerners. The four volumes enumerated just now appeared within the space of two years, and their author still found time and strength for various other works, including a novel for the *Nuova Antologia*. And this abundance is not secured at the cost of the workmanship; here is a workman who has a fine sense of his craft. And because the judgment of a foreigner in such matters is apt to be held in light esteem, I quote that of a competent authority, Ugo Flores, given in the *Nuova Antologia* of May 16 last: "The personality of Pirandello . . . has this superiority over all the other story tellers. . . . Palmarini narrates with more vivacity, Ojetti with more *brio*, Panzini with more sentiment; no one writes like Pirandello, whose prose is full of life, rich, flexible, . . . a prose that has a physiognomy like a person, a prose that, without strain on the part of either author or reader, distinguishes itself on every page by its incomparable directness." For the rest, Pirandello has the gift, so rare in Italy, of humor, an irresistible humor that sports with death as well as with life. His subjects are of the greatest variety, excluding only young love; an exclusion that, when one is of a certain age and asks only to be amused, is readily accepted. And, unlike many of his kidney, he does not altogether lose the gaiety of his earlier period with the sobering progress of the years. At least that is true at present. The fun of "Amicissimi" in 'Bianche e Nere' is madder than that of "Le Tre Carissime" in the first 'Beffe.' Let any one who wishes to pass a pleasant hour, read "Il Vitalizio" or "La Signora Speranza" in the second 'Beffe,' or . . . but I will not go further in the invidious selection; either of these will

engage the reader to continue till the four volumes can offer nothing more that is new.

Correspondence.

THE GEORGE PEABODY COLLEGE FOR TEACHERS.

To the Editor of The Nation:

Sir: The editorial article on the Peabody Fund in your issue of February 2 contains some inaccuracies in the paragraphs that relate to the College for Teachers at Nashville. Kindly permit me to correct them.

First, the institution formerly known as the Peabody Normal College has been called since 1902 the Peabody College for Teachers, and the title recognized by the trustees of the Peabody Fund in their resolution to endow the college was, in full, the George Peabody College for Teachers.

Secondly, the grounds upon which the College was established are not those of the State University, but those of the University of Nashville.

Thirdly, the conditions of the gift of $1,000,000 to the college do not require the city of Nashville to raise a similar amount. The city is pledged to give $200,000, the State $250,000, Davidson County $50,000; and the Trustees of the University of Nashville are to convey to the Peabody College for Teachers the grounds and buildings now occupied by that institution and valued at something over $300,000.

Fourthly, the aid given in the past by the State of Tennessee has been understated. According to your informant, the State has appropriated $15,000 since 1891. In fact, the annual appropriation was $10,000 from 1881 to 1891, $15,000 from 1891 to 1895, and $20,000 from 1895 to the present time.

Finally, the third paragraph of your article may easily, though perhaps not necessarily, be construed as indicating that the Peabody College for Teachers is intended for students of both races, whereas it is for prospective teachers of the white race only. The benefactions of the Peabody Fund, as distinguished from those of the Slater Fund, have been directed chiefly to the education of the white people of the South.

Very truly yours, Jas. D. Porter,
President of the George Peabody College for Teachers.

Nashville, Tenn., February 16, 1905.

BARTRAM REDIVIVUS?

To the Editor of The Nation:

Sir: While the fever is on for reprinting earlier American itineraries, could not some patriotic Philadelphian be induced to revive the 'Travels' of the Quaker natural scientist, William Bartram? Bartram's fascinating narrative of his journeys 'Through North & South Carolina, Georgia, East & West Florida, [etc.]' hardly needs recalling to American botanists and ornithologists, or for that matter to European; as a scientific record, however florid in style, its value seems to have been understood from the first. According to Sabin, the work went through two editions in this country (Philadelphia, 1791, 1792), was reprinted twice in London (1792, 1794) and once in Dublin (1793), and was thrice translated on the Continent (Berlin, 1793; Haarlem, 1794-1797; Paris, 1799-1801). I have never seen the Dutch translation. Last summer I found other versions at Lund, Stockholm, and Upsala; there, no doubt, in consequence of the friendly relations between Bartram and the successors of Linnæus (cf. Harshberger's 'Botanists of Philadelphia'). Outside of collections, however, the book is rare both abroad and at home, so that to those interested in the geography of our Southeast a reprint should not prove unwelcome.

More particularly, a reprint might prove useful to a far different class. For some reason Bartram has of late escaped adequate notice from historians of American literature; Richardson, Wendell, and Trent, for example, fail to index him, although Stedman and Hutchinson include him in their "Library." Previous authorities, like John S. Hart and Duyckinck, knew him better. His book is, in fact, a typical specimen of romantic nature worship, deeply tinged with the doctrines of Rousseau, and all the more striking because from the hand of a recognized, though youthful, scientific observer. It is important, further, in that its richly colored descriptions of Indian life and subtropical scenery caught the imaginations of several, perhaps many, Romanticists across the water. Coleridge in "The Wanderings of Cain," Southey in "Madoc," Wordsworth in "Ruth," all levied on Bartram considerably; Bowles at least read him; in 'Atala' and the 'Voyage en Amérique,' Chateaubriand, as M. Bédier has pointed out ('Études Critiques'), filched from him remorselessly. I have suspicions of De Quincey and "Christopher North." Indeed, it would not be surprising if careful search revealed an interesting set of transatlantic literary relations wherever this remarkable work found susceptible readers, say, in Holland, Germany, and Sweden also. Its place and possible influence in our own literature will hereafter, let us hope, receive proper attention.

I have a mere impression that one or two years ago some local paper in North Carolina found space for a serial reissue, in whole or in part, of the work in question. A publisher of secure standing in New York or Philadelphia could rejuvenate it more effectively. Lane Cooper.

Cornell University, February 13, 1905.

Notes.

J. B. Lippincott Co. will begin their "French Men of Letters" series, edited by Dr. Alexander Jessup, with 'Montaigne,' by Edward Dowden; and will further bring out during the spring 'Mirabeau and the French Revolution,' by Charles F. Warwick, ex-mayor of Philadelphia; 'Diplomatic Mysteries,' by Vance Thompson; a new edition of Bigelow's 'Biographical Life of Franklin,' from 1775 to its close, enriched with much fresh material, in three volumes; and 'Young Japan,' by James A. B. Scherer.

Houghton, Mifflin & Co. will publish directly 'Out of Bondage, and Other Stories,' by Rowland E. Robinson; 'The Hawthorne Centenary,' July 4-7, 1904, illustrated; 'Our Navy and the Barbary Corsairs,' by Gardner W. Allen; and, in a limited edition, Boccaccio's Life of Dante, translated by Philip Wicksteed, printed on a hand-press from type, in quarto form.

Little, Brown & Co. announce 'An American Girl in Munich,' impressions of a music student, by Mabel W. Daniels, and a new popular illustrated edition of Baird, Brewer and Ridgway's 'History of North American Land Birds,' in three volumes.

The Macmillan Co. will shortly bring out 'The Primitive Character of Religious Revivals: A Study in Mental and Social Evolution,' by Prof. Frederick M. Davenport of Hamilton College, and 'The Horse,' by Prof. Isaac Phillips Roberts.

G. P. Putnam's Sons have in press 'The Old Shipmasters of Salem,' by Charles E. Trow, and 'A Digit of the Moon, and Other East Indian [Love] Stories,' translated by F. W. Bain.

The Société Gaston Paris, organized by the pupils and friends of that scholar, announces that the bibliography of his writings, which has been compiled by Professor Bédier, of the Collège de France, is to appear in the near future. The Society has further decided to print the catalogue of Gaston Paris's library, the editing of which is almost completed.

The subject of the course of lectures to be delivered at Harvard University by Dr. Sandys, public orator in the University of Cambridge, between March 20 and April 15, will be "The Revival of Learning in Italy."

The third volume of Dr. Thwaites's sumptuous edition of the Lewis and Clark Journals (Dodd, Mead & Co.) carries the expedition through the perilous descent of the Columbia to "the Great Western Ocian"—"I can't say Pasific," adds Captain Clark (Dec. 1, 1805), "as since I have seen it, it has been the reverse." Here we have a picture of the terrible fall and early winter which the company endured in a state almost of nudity and starvation, amid incessant rains and storms; fending off the Indians, whose even innocent visits inflicted a torture of communicated fleas. We have two plans of Fort Clatsop by Clark, and a generous supply of his maps with other facsimiles. There is much repetition because of double drafts, and so fine a phrase as Lewis's "dismorallity of order in the abdomen" thus scores a double entry. The same is true of his acute observation (pp. 315, 330)—"a general maxim"—"that those nations treat their old people and women with most difference [deference] and rispect where they subsist principally on such articles that these can participate with the men in obtaining them." It is Lewis also who reports the inquiry of "a young [Indian] fellow," on a hint that it would be for the welfare of the several nations to be at peace with each other, "what the nation would do for Chiefs?"—"taking as granted that there could be no other mode devised for making chiefs but that which custom had established through the medium of warlike ac[h]ievements." This has always perplexed the apostles of Jingoism.

The tenth volume of Dr. Thwaites's "Early Western Travels, 1748-1846" (Cleveland: Arthur H. Clark Co.), is usefully composed of reprints of works bearing on a colony of English emigrants of character and breeding in Edwards County, in southeastern Illinois—"English Prairie," now to be

located at Albion. A polemical literature, fostered by Cobbett, sprung up over it, and Dr. Thwaites gives us Hulme's Journal, 1818-19 (chiefly remarkable for its incidental notice of Rapp's Harmony), Flower's Letters, 1819-21, and Woods's 'Two Years' Residence,' 1820-21—this last the most important on the economic side. The Birkbecks and Flowers of the English colony were efficient co-workers with Gov. Edward Coles in excluding slavery from Illinois. Flower's pictures of slavery are brief but to the life. "Anything," he remarks, "that a black is made to perform, is pronounced unfit for whites."

It is nearly ninety years since Francis Asbury died, and more than fifty since the chief edition of his Journal was printed. The memory of this main pioneer and organizer of American Methodism is now honored by substantial extracts, covering the forty-five years of his ministry in this country, in a revised and corrected text, edited by Ezra Squier Tipple, D.D., as 'The Heart of Asbury's Journal,' and published in a thick octavo by Eaton & Mains, New York, for the Methodist Book Concern. The author wrote by fits and starts, under all the difficulties of a laborious and constant itinerary, and the compiler has not improved his unpretentious jottings beyond recognition; but one may find items of antique or curious interest. Thus, the future Superintendent observed November 26, 1784, as a day of fasting and prayer in view of his coming ordination, etc., and was "not tickled with the honor to be gained." On August 12, 1773, "a serious negro was powerfully struck; and though he made but little noise, yet he trembled so exceedingly that the very house shook." On the same day, apparently, "we saw a little woman with neither hands nor feet; yet she could walk, card, spin, sew, and knit." Illustrations (from Hurst's 'History of Methodism') are numerous, and the Index fills eight double-columned pages.

Drenthe, poorest and obscurest by far of the Dutch provinces, gave birth in 1776 to Harm Jan Huidekoper, who emigrated at twenty and made haste to become a good American. After ten years spent at Oldenbarneveld, N. Y., in Philadelphia, and in travel, mostly in the employ of the Holland Land Company, he settled at Meadville, Pa., where he attained prosperity and importance, and did much to improve the town. Imbibing liberal views, he founded the local Unitarian church, and made it a centre of influence when that faith was (to put it mildly) an unwelcome stranger in the region. Through life he served his adopted communion with pen and purse, editing and mainly writing the *Essayist* (1831-2), the precursor of the *Western Messenger*, and promoting the foundation and enlargement of the Meadville Theological School. His generosity went beyond bounds of sect; "'Charge it to Huidekoper' became a current saying as widely known as 'Nobody knows but Huidekoper, and he won't tell.'" Not his worst epitaph would be the saying of a child to whom he thought himself unknown: "Oh yes, I do; you are the man who builds churches and schools"—with his prompt response, that there was something much better to build than those, namely, character. In 1852, some twenty months before his death, an enthusiastic visitor described him as "the most ideally beautiful old man, . . . the perfect host, . . . the indomitable subduer of the wilderness, the eager enlightener and student of advancing Biblical criticism, the practical Christian with a trace yet lingering in him of the old controversial fire, and yet, above and beyond all else, the promoter of good works, the lover of his kind." His memoir, by Nina M. and Francis Tiffany, printed at the Riverside Press, Cambridge, is in a more restrained style than this passage would indicate; and if parts of it have a somewhat archaic air, recording the subject's proficiency in Scripture and in confutation of the orthodox, these indicate one phase of an earnest life. One of his daughters became Mrs. James Freeman Clarke, and some of his descendants are still in or near Boston. The Index is liberal, and the genealogy equally full, going back to 1530. The appendix on the Holland Land Company should have some historical value.

The forty-fifth volume of the publications of the Oxford Historical Society, 1903-4 (H. Frowde), is entitled 'The Ancient Kalendar of the University of Oxford,' edited by Christopher Wordsworth. The manuscript of the calendar, whose date is about 1337, is in the Library of Trinity College, Cambridge. It was composed in the first place for French use, and perhaps came from Caudebec, in Normandy. But it was adapted in the same century by interlineations and additions to serve as an Oxford Calendar. In 1868 it was published in Anstey's 'Munimenta Academica,' but the idea of the Historical Society in getting out this reprint is to indicate more fully than was done by Anstey the obliterated passages in the old calendar, and to make the present edition as far as possible a facsimile of the original, now much faded. As one looks through it, it reminds one of nothing so much as of Hesiod's catalogue of lucky and unlucky days. The "Egyptian days" were so called because the Plagues of Egypt fell on them. It was not the whole day, but some hour in each—the hour when the plague struck—that was thus solemnly banned. There were two days in every month styled Egyptian, which, it will be observed, calls for twenty-four, not ten plagues. It cannot have been easy to remember that the sixteenth day of a thirty-one-day month was never unlucky, and that "the first day from the beginning and the seventh day from the end of the first month" must be avoided as unlucky for bloodletting. No wonder that a *memoria technica* in verse was placed at the beginning of each month to warn the members of the University. Besides this, and the calendars of the Universities of Paris and Cambridge in the fourteenth and sixteenth centuries, the volume contains the text of a 'Computus Manualis' of the early sixteenth century. It is really a University text-book, the forerunner of the publications of the two great English University Presses, and treats of the solar cycle, the festivals and the seasons in about 250 Latin hexameters. Altogether, nine such documents are here reprinted with the fullest possible notes and indices. There are some curious illustrations in facsimile which formed the frontispieces of the MSS.

Deserving of more than the brief mention that we can give them, are M. Yves Guyot's suggestions in 'Les Conflits du Travail et leur Solution' (Paris: Bibliothèque Charpentier). He tells us much of the policy and practice of trade-unions in different countries, especially as illustrating their results on production and on the relations between employers and workmen. The solution for which he argues with much force is the organization of labor on an economic basis. The unions, which are now organized for conflict, should be organized for profit. They should be *sociétés commerciales de travail*, selling not their labor, but the products of it, to those with whom they contract. If we are not mistaken, Mr. Brassey described many years ago organizations of this kind among the navvies that he employed in railroad building, and spoke favorably of their operation.

Whatever may be thought of the practical uses of mathematical economics, there can be but one opinion of the merits of the little treatise on the subject by Mr. H. Cunynghame, entitled 'A Geometrical Political Economy' (H. Frowde). The author has the rare art of being brief without being obscure, and his enthusiasm for his method is really contagious. He assures his readers that the book requires of them no knowledge of mathematics except such geometry as is acquired at school, and very little of that; nor is the claim exaggerated. Every one who is fond of mathematics will agree with the author that "the geometrical method is so charming when once it is grasped, and enables somewhat recondite laws to be so clearly seen, that its mastery is worth an effort." No doubt, when premises are given, conclusions may be elegantly drawn by means of diagrams; but, after all, the great thing in economics is to establish the premises, and in this process the abstractions of mathematics are of little use.

In parts 28, 29, the General Catalogue of Italian Publications from 1847 to 1899 (Milan: Hoepli; New York: Lemcke & Buechner) advances to the middle of the letter S. It is noteworthy that only three of the 114 works of Ruskin are in the list, the 'Stones of Venice' not among them, and all in the last decade of the last century. Scott is still in request, with 'Ivanhoe' at the head in number of editions. He falls but a little short of Shakspere, who fills three-quarters of a page, with "Hamlet" (a new abridgment for the Italian stage was made in 1899) and "Othello" to the fore, while "Romeo and Juliet" (or, by Italian courtesy, "Giulietta e Romeo"), "The Merchant of Venice," and "Julius Cæsar" follow close. But one separate issue of "Two Gentlemen of Verona" is recorded—in 1870. A translation of Shelley's 'Adonais' appeared in 1899, and in that decade there was a distinct Shelley revival in the peninsula. Schiller is alive in fresh translations; Schopenhauer, too, from 1888 to 1898. Savigny's 'Roman Law' was brought out anew in eight volumes between 1886 and 1898. George Sand is still a favorite, and Jules Sandeau was issued up to 1886; Scribe lingers if he does not hold his own, but Sardou shows no wane. The schools make steady request for Sallust, and for Xenophon (Senofonte) in particular. Fra Salimbene's Chronicle had for its two poles 1857 and 1882. The one American author we have noticed in this part of the alphabet is Sankey, whose Hymns were published in 1889.

The prominent feature of the *National Geographic Magazine* for February is the article on Russia by our former minister, Mr. Charles Emory Smith. The difficulties

with which the Czar's Government has to grapple are lucidly explained, and just tribute is paid to the endeavors of such men as Vishnegradski and Witte to improve the condition of the people. "Russia has ministers, but no ministry"; and attempted reform has failed because "advance has been from the top, not from the bottom," are two of his terse statements. He closes with a reference to the wonderful recuperative powers of the Russians, and hopes that through the present trials the empire will enter on a new and brighter epoch. The conditions of the coast surveys of the world are shown, with the aid of maps, by Mr. G. W. Littlehales, in which we note the fact that "nearly all of the coasts of the empire of Japan have been completely surveyed and charted." Our consul at Hangchau gives a most interesting account of the vitally important part which Chinese canals play in furnishing food, fertilizers, irrigation, and means of transportation to the people. This number of the magazine contains, as a supplement, a chart of the world on Mercator's projection, showing the submarine cable lines and their connections and ocean routes. Tables of distances are printed at the bottom of the chart, and add much to its usefulness.

The completion of the fiftieth volume of *Petermann's Mitteilungen* is appropriately commemorated by the editor, Dr. Supan, in the December number. He reproduces Dr. Petermann's salutatory dated February 15, 1855, in which the object of his new journal is modestly said to be "the adding in some small degree to the general knowledge of the new or especially important investigations in the sphere of telluric science." There have been published 1,451 sets of maps and charts, of which 293 were of Africa and 59 of North America, and 14,800 notices of publications. From an examination of the various rainfall statistics Professor Kassner shows that the moistest place in Europe is Crkvice, on the Dalmatian coast, where the average annual precipitation is 186 inches [4,719 mm.]. A brief account is given of the various attempts to solve the question of the possibility of a northeastern passage through the Siberian ocean, with a notice of the proposed Greenland biological station at Godhavn, which will serve for observations of the aurora, earthquakes, and other natural phenomena, while there will be a garden in which to study the effects of light and temperature on plant growth. Attempts will also be made to give the natives an industrial education with especial reference to fishing and trapping.

With the present year a new high-grade journal has made its appearance in Paris entitled *Revue Germanique*, supported by the Universities of Lille, Lyons, and Nancy. The reviews will embrace German, English, Dutch, and Scandinavian books. The list of contributors includes many of the leading scholars of France.

An interesting innovation in the line of book-dealers' catalogues has just been made by the house of Eugene Diederichs of Jena. It contains not only elegant illustrations and samples of texts, but also twelve introductory essays of scientific value in the different branches of literature represented in the catalogue, prepared by recognized authorities, *e. g.*, Hermann Büttner on German Mysticism, Dr. Christlieb on German History and Culture, Karl König on Religion, and the publisher himself on the "Kultur der Bücher." In the last-mentioned essay it is noteworthy that so good an authority as Diederichs acknowledges that, externally, English books still stand vastly above the level of German books. The Munich *Allgemeine Zeitung* rejoices at this open confession, because it is foolish to close one's eyes to actual facts.

The recent visit of the Viceroy of Nankin to St. John's College, Shanghai, an institution maintained by our Protestant Episcopal Church, has a peculiar significance as showing that one of the most prominent officials in the Empire, the ruler of nearly 70,000,000 people, does not hesitate to show publicly his interest in the Christian education of his countrymen. Accompanied by his secretaries and the chief local officials, he inspected the buildings, including St. Mary's Hall, the school for girls, attended the class sessions, and examined the text-books. The next day he sent $350 to be distributed in prizes to the students of both institutions for the best essays on certain assigned subjects. He also bought 200 copies of the New Testament from the American Bible Society, saying that he meant to distribute them among his leading officers. The standing of St. John's College may be gathered from the fact that there are nearly 300 students, and application for admission must be made a year in advance. Another sign of the awakened educational interest is the establishment of many native so-called "Anglo-Chinese schools." The instruction given in them is somewhat problematical, judging from the advertisement of one of them in a native paper: "English taught as far as the letter G."

The narration of Nehemiah How's Captivity noticed by us last week is the fourth volume in Burrows Brothers Co.'s Captivity series—not the first as we inadvertently stated.

—'A Memorial Biography' of Eugene Augustus Hoffman, D.D., D.C.L., LL.D., has been prepared by his former colleague, Dr. T. M. Riley, and privately printed in two handsome octavos at the Marion Press (Jamaica, N. Y.), liberally illustrated with portraits and representations of the churches wherein its subject officiated —at Elizabeth and Burlington, N. J., and in Brooklyn and Philadelphia, 1853-79— and of the buildings which he erected for the Episcopal General Theological Seminary, of which he was the very capable head and eminent benefactor from 1879 till his death in 1902. This latter position especially was conspicuous and widely influential, and the book should be welcome to the many who knew the Dean personally and honored him for his work: it is appreciative, orderly, and so full that its 795 pages of noble type leave nothing to be desired except an index. It even reproduces a Rutgers College Mock Programme of 1847. Dr. Hoffman came of old Knickerbocker stock; he was of the quiet, conservative type, "a man of affairs, with special genius for business and executive work," and with nothing sensational about him but the inherited wealth which increased his means of usefulness. As his biographer says: "He was never primarily a theologian, or indeed primarily anything but an admirably well-balanced man, in whom the note of our common nature was always predominant. . . . He wrote no great books; he ventilated no schemes of sociological or of theological improvement to the world; he offered no advice to the public for the reconstitution of human society. He simply abode in the path of achievement marked out for him by his office as a priest, and by his gifts of constitution and rule. . . . And so he became great, because he was faithful, humble, wise, modest."

—The biography of a living revivalist, by one of his followers, will be received with grains by those not of the fold; yet the Baroness de Bertouch begins her 'Life of Father Ignatius, O.S.B., the Monk of Llanthony' (E. P. Dutton & Co.), with an appeal "to those who *think*" (the italics are her own). But for this warning, the topic and its treatment might appear better adapted to those who merely feel. Joseph Leycester Lyne was born in London in 1837, and ordained deacon in 1860. As curate at Plymouth he healed the sick, cast out devils, etc. He soon assumed the Benedictine habit, headed a community, and at twenty-five began "his campaign against World and Church"—happily, for the reformation, not destruction, of both; his aim being to save souls, to reëstablish monachism as in the early British Church, and incidentally to suppress heresy, or any opinions adverse to his own. His miraculous gifts, with visions and revelations, continued. Thus, in 1873, when his abbey church was building, a heavy crate of stones fell upon a workman, crushing him out of human semblance. The abbot, being called to the scene, sprinkled some Lourdes water upon the body, which thereupon, after "one single and mighty thrill," arose unscarred and walked home. This was not the only time he raised the dead, or near it. He had other talents, less uncommon but perhaps of equal practical utility—a highly vital and emotional temperament, unbounded confidence in his powers and his cause, a ready tongue, and (presumably) good lungs. So cocksure and irrepressible an evangelist, when unhampered by small scruples of modesty, courtesy, and charity, should be able to command audiences and exert a wide influence. And he did. Crowds followed his preaching; admirers, disciples, converts thronged about him; nor were means wanting to carry out his plans—see the pictures of his cloister, his lawn, his elaborately carved chair. Thus he thrived under obloquy and persecution, for he lacked not the courage of his convictions. When that "semi-infidel" Dean Stanley, who had called Lyne "about the last primitive Christian left on earth," was asked to preach at Scarborough, the Father held an opposition service there on the same day. After Dr. Jowett's death, he went to Oxford to protest against the honors paid to that "demagogue," the guilty translator of "Plato's abominations"; and it was not his fault that the students would not hear him through. In 1890-91, while in America, he almost ended "Heber Newton's days of unchecked infidelity," but unluckily was less successful with "another unfaithful preacher of the Word—a certain Dr. Rainsforth [*sic*]—and the famous Phillips Brooks." The Baroness's 600 octavo pages contain much more edification of this peculiar flavor.

—'Men and Manners of the Third Republic,' by the late Albert D. Vandam (James Pott

& Co.), was left unfinished at the time of the author's death. A publishers' note tells us that the second half of the book "was extant in the shape of papers and contributions to periodicals." To make out the volume, materials of this kind were used, though the publishers profess to have followed the author's own design, and also to have edited with all possible care such portions of the book as had not been revised by the author himself. Mr. Vandam will probably be remembered less as a veteran journalist than as "the Englishman in Paris" whose anonymous autobiography aroused so much interest in 1892. The tone of the present work is extremely journalistic, and its historical value depends altogether on the credit which one attaches to Mr. Vandam's "notes." Any intelligent man who had been a journalist for twenty years, would have enough gossip of one kind or another to fill out three hundred pages, especially if he gave free rein to his likes and antipathies. Dislike of Gambetta and admiration for Jules Simon are among the chief elements of the present narrative. Altogether, the Third Republic receives quite as hard treatment here as it gets from Mr. Bodley in his more dispassionate account of modern France. Mr. Vandam did not shrink, in contrasting the French politicians of recent days with the men of the Second Empire, from acknowledging his preference for the latter; or at least he was willing to state that, as a statesman and diplomatist, Louis Napoleon stood head and shoulders above any of the republicans except Thiers. If his diplomacy failed, its failure is ascribed to the limiting action of the French Chamber, which cramped his policy where Bismarck was able to carry through his plans by sheer dictation. Charges of wholesale peculation are brought so sweepingly against our own contemporaries as to dispel all belief in the morality of French statesmen. Apropos of the fortunes amassed by ministers through stock-jobbing operations, the author says: "I could prove that not only Talleyrand and Louis Philippe did this, but that absolutely every man of the Third Republic, with the exception of five, whose names I must for obvious reasons omit, owe the large fortunes they have amassed to those methods." Statements of this sort, in point of form, at least, take us back to the Grub Street literature of the eighteenth century. Much that is here said about the iniquities of French political life may be quite true, and the book, taken in small quantities at a time, is not devoid of a certain interest. But a rigorous criticism would show that the historian must quote it, if at all, with care.

—'Napoleon's British Visitors and Captives,' by Mr. J. G. Alger (James Pott & Co.), is similar in tone and character to such other books by the same author, as 'Englishmen in the French Revolution' and 'Glimpses of the French Revolution.' That is to say, it consists largely of biographical notices, none of which runs to any great length, but of which a large number are crowded into a single volume. After the Peace of Amiens the tide of British tourists at once set strongly toward Paris, for, apart from the amusements of that gay city, there was a general curiosity to see how far its outward aspect had changed since the opening of hostilities between England and France in 1793. On the renewal of war in 1803, Napoleon detained many Englishmen as hostages, and some of these languished in Paris and other parts of France for years. By its subject Mr. Alger's work recalls Miss Alice Baker's book on the New England captives in Canada, but Napoleon detained far more people than were carried off from Deerfield and other places in New England during the course of the French raids. Those who are familiar with Forsyth's excellent handbook on Italy will remember that it was a by-product of the writer's captivity in France. If one could only attract the notice of Napoleon or Josephine, there was some hope of securing a release, and literary distinction furnished the best ground for an appeal to the Emperor's clemency. Forsyth was seized by the French police at Turin, on May 25, 1803, while returning home by way of the Cenis, with no intention whatever of entering France. Why this Scottish schoolmaster should have been apprehended it is hard to imagine, unless we assume that Napoleon wished to lay hands on every Britisher in sight. We need not follow the adventures of any single captive in detail, but Forsyth's misfortunes, as related by his brother, show how uncomfortable a British captive might be in France, and how difficult it was to escape from the country. Mr. Alger, through recourse to the police records of Paris, has been able to prepare a more accurate list of visitors and captives than was available to writers of the Dictionary of National Biography. "The most vivid picture," he says, "of the life and treatment of the captives is gained from the police bulletins daily prepared for Napoleon and now preserved in the French archives. They also throw a flood of light on the character of Napoleon's internal rule, yet, so far as I know, no French historian has as yet utilized them, and I have every reason to believe that I am the first English writer who has consulted them." This volume contains a good deal of gossip, not unmixed with pure scandal, but it is a mine of anecdote, and contains a wonderfully full directory of the Englishmen with whom Napoleon came in contact prior to his first overthrow.

SAINTSBURY'S MODERN CRITICISM.

Modern Criticism. [A History of Criticism and Literary Taste in Europe. Vol. III.] By George Saintsbury. Dodd, Mead & Co. Pp. 656.

Mr. Saintsbury's first volume dealt with classical and mediæval criticism, his second covered the three centuries from the Renaissance to the death of eighteenth-century Classicism; the third and last surveys the nineteenth century, with some casting back to the eighteenth to pick up the dissenters and pioneers whose heresies have now become orthodoxy. Many if not most histories of literature tend to put on speed towards the finish, but in the story of criticism the plot thickens as the centuries advance. Moreover, the minor critics whom time has had no chance to smother must have each his page or paragraph, and many who already show a distinct weakening of vitality must be revived and brought into line with the rest. At this rate one volume a century is not unreasonable. Mr. Saintsbury set out to write an appreciation of the critics of all times and nations, a sort of history that can never be impersonal or impartial. But he declares that all he aims at giving is an atlas of the facts, and expressly declines to supply the complement of theory; he refuses to define that single purpose held, where'er they fared, by most of the critics reviewed in this volume. The port they sought was Romanticism; but when you ask him what precisely he means by that, he will only answer that it was the port they sought. That evasion is the keynote of the book. He is ready, like Matthew Arnold when asked for a definition of the grand style, to let those who can neither make definitions of their own nor put up with mere appreciation, "die in their sins." *Der Teufel hole alle Theorien!*—and he is welcome to the definitions also. Lessing, "with all his talent and freshness," had not attained to this level of individualistic criticism. He said in the 'Dramaturgie,' of Corneille's "Rodogune," that "the revenge of an ambitious woman should never resemble that of a jealous one." On which Mr. Saintsbury remarks: "*Æternum vulnus!* What is *the* revenge of *an* ambitious woman?'—'*the* revenge of *a* jealous one?' Show me the revenge of your jealous Amaryllis, the revenge of your ambitious Neæra, and then I will tell you whether they are right or not." His disgust is the greater because Lessing, though he had one foot still clogged in Classicism, had set the other in the excellent way that led to Romanticism. Mr. Saintsbury is, in fact, a sort of Protagoras. The individual man is the measure of all things literary; what seems admirable to me is admirable, and what seems so to you is admirable also since you admire it. That is his canon—to have no canons. "A man's likings are facts in criticism for him."

The Neo-Classic error was to have a definite critical goal, to set limits, to give too little rope to the unlimited variety of human genius, to force each of its manifestations into one of the existing categories, one of the literary kinds. This made it decidedly awkward for the novel and the ballad, those interesting outlaws. Romanticism changed all that, and here we have the story of the literary revolution that was being prepared even in the eighteenth century. It is really the story of how criticism learned to follow literature and to give up setting the pace. The New Critic was one who, confronted with a drama, whether of Shakspere or another, applied no test derived from Aristotle or Horace, shut his eyes to the "unities," followed his feelings, and asked himself whether he liked it and how and why.

Three commandments Mr. Saintsbury formulates for the guidance of a critic and for his critical principles:

> "He must read, and, as far as possible, read everything. If he omits one period of a literature, even one author of some real, if ever so little, importance in a period, he runs the risk of putting his view of the rest out of focus. . . . He must constantly compare books, authors, literatures, indeed, to see in what each differs from each, but never in order to dislike one because it is not the other. Thirdly, he must, as far as he possibly can, divest himself of any idea of what a book *ought to be*, until he has seen what it is."

Not all even of the "modern" critics have kept these commandments.

Mr. Saintsbury devotes the first third of

the volume to "The Dissolvents of Neo-Classicism," to the men who mutinied against the preceptist attitude. For some of these we hark back to the eighteenth century, and revive some of the smaller fry among Swiss, German, and English critics—among the last, Bishop Hurd and John Mason, interesting only to the specialist in criticism who sees in a single independent judgment another nail in the coffin of Classicism. Lessing and Diderot come in here, reserved for this volume, the latter because he was "the first considerable critic known to history who submits himself to any, to every work of art which attracts his attention, as if he were a 'sensitized' plate," and the former because, inspired by Diderot, he himself set out to revalue critical principles. Many readers will think that the most interesting pages in this section are those on Chateaubriand, for the complete appreciation of whose place as a literary critic one must still of course turn to Sainte-Beuve. Here we may note how the subjectivity of individualistic criticism leads to disagreement about critical principles among the Romantics themselves. Mr. Saintsbury cannot endure the method of Saint-Marc Girardin because he wrote studies of 'L'Amour Conjugal chez Shakespeare,' and "'La Jalousie' in this, that, and the other. . . . These things seem to me to be learning's labor lost. Study Othello, study Leontes, as much as you like. . . . but not to extract a dead essence in a bottle and label it 'Jealousy in Shakespeare'—or rather *in vacuo*." Now Sainte-Beuve, a true Romantic in Mr. Saintsbury's sense, devoted to Girardin a short sarcastic *Causerie* full of faint praises and saving-clauses, rallying him because he had too thoroughly converted the ardent youth of France from its dreams of being a great poet or dying in the attempt, to the more positive ambition to live and be a *préfet* by twenty-five. But Sainte-Beuve expressly admired Girardin for his new and bold history of the passions that are the springs of the drama, and went on to show that Girardin had borrowed this historical treatment of sentiment from Chateaubriand himself, who, in his 'Génie du Christianisme,' "choisit les sentiments principaux du cœur humain, les caractères de père, de mère, d'époux et d'épouse, et il en suit l'expression chez les anciens et chez les modernes." This is a typical instance of a certain superfluity of personal judgment in Mr. Saintsbury's work as a whole. One must always remember, in reading him, that he writes with the strongest possible bias, and that, however useful and even indispensable to the student of literature his History is, it is rather as a work of reference than as a storehouse of reliable literary judgments.

The second third of the book deals with the "Reconstruction of Criticism," with a chapter each to England, France, and Germany; England, of course, leading with Wordsworth, Coleridge, Southey, Lamb, Leigh Hunt, Hazlitt, and the rest, their companions or opponents. For the opponents such as Gifford there is short shrift. Here Mr. Saintsbury is at his best with Coleridge, whom he ranks as the third great critic of all the ages, with Aristotle and Longinus. It would be well, indeed, if the 'Biographia Literaria' were as familiar to students of literature as the 'Poetics' and the 'Treatise on the Sublime,' but we imagine that few except specialists in English literature ever look into it. Mr. Saintsbury's exhortation to the reader is characteristic:

"Begin with him, continue with him, come back to him after excursions, with a certainty of suggestion, stimulation, correction, edification. *C'est mon métier à moi d'être professeur de littérature*, and I am not going to *parvify* my office. But if anybody disestablished us all (with decent pensions, of course), and applied the proceeds of our chairs to furnishing the boxes of every one who goes up to the university with a copy of the 'Biographia Literaria,' I should decline to be the person chosen to be heard against this revolution."

No wonder that Mr. Saintsbury's critics are always asking how a man who expresses himself like that can expect one to heed him on questions of literary tact and taste. It is amusing to find him, on page 22, suggesting that "if I found any encouragement to do so, I would very gladly write" a book on the general subject of "Taste."

France makes up for her vacillation in politics and religion by her conservatism in literature. It was easier, as some one has said, for the French to overthrow Christianity than to dispute the authority of Boileau. The performance of "Hernani" in 1830 is usually reckoned as the triumphant début of French Romanticism; but there had been precursors of Hugo, and of Sainte-Beuve, who is the greatest figure among the French critics of the nineteenth century. He has the lion's share of the whole volume, and is treated to an unstinted appreciation, tinctured by a certain patronage that would have infuriated Matthew Arnold. "We want a little more theory; some more enthusiasm; a higher and more inspiring choice of subjects." Mr. Saintsbury cannot tolerate the French "scientific" critic, of whom Hennequin is the type, going further, as he did, even than Nisard and Taine. Hennequin, in fact, offers one of those cases in which personal prejudice makes anything like a fair estimate impossible to our author. If he had not wisely confined his history to the critics who are no longer living, we can imagine with what gusto he would have attacked M. Brunetière, who is certainly the most formidable of the party of reaction to Neo-classicism.

The last third of the volume, devoted to "The Later Nineteenth Century," includes a study of English criticism from 1860 to 1900, and has for its central figure one of the "greater critics," Matthew Arnold. His chief heresy, in Mr. Saintsbury's judgment, is his insistence that in poetry all depends on the subject. Now, to hold the doctrine of the "Poetic Subject," as against what he calls the doctrine of the "Poetic Moment," is enough in itself to antagonize Mr. Saintsbury. Nor can he endure Arnold's limitations of "the Grand Style" by the prescription of "simplicity, severity, and seriousness." Here is a "fresh formulation of the classical restraint . . . against the Romantic fantasy." The preceptist manner of Arnold, his neglect of the historical method in dealing with a subject like Celtic literature, his attempt to "reconstruct the classic faith, taking in something, but a carefully limited something, of Romanticism," are wholly opposed to Mr. Saintsbury's ideals, and he revenges himself by calling Arnold a "*neotato*-classic," which, to a man of Arnold's fastidiousness, would have been punishment enough. It is, however, in his pages on Arnold, whom he does in the end rank high, for all his reactionary tendencies, that Mr. Saintsbury is at his best on the subject of "the Poetic Moment—the sudden transcendence and transfiguration—by treating poetically, that is to say, by passionate interpretation, in articulate music—of *any* idea or image, *any* sensation or sentiment."

In an Appendix that has an historical interest, Mr. Saintsbury outlines the contributions to criticism of those who have held the Oxford chair of poetry with the exception of Arnold, who had of course been treated separately. The contribution of the rest was indeed slight. Palgrave's 'Golden Treasury' is the most notable, and it is stretching a point to call that criticism. The second appendix is devoted to American Criticism. There the author's rule of omitting living writers narrows his range. Ticknor, the first American critic who counts, is admitted to be more of an historian. Longfellow's criticism Mr. Saintsbury bids one gather from his poems, which is more than he had allowed to Keats. Emerson is "Carlyle *plus* Vinet," which means that he will not consent to look on literature as literature, but must always be dragging in ethics and transcendentalism. Whipple is brought into a prominence that will surprise many of his countrymen. Poe is treated very fairly; Lowell is given his proper place as "the premier critic of America"; and Lanier is damned in a few trenchant phrases. Mr. Saintsbury dismisses American criticism with a word of regret that it should "go too much to Germany for patterns," but grants that on the whole it is growing more cosmopolitan and more learned. Considering how little on the whole he thinks of our dead critics, he has been generous with his allowance of sixteen pages, especially in a work whose title limits it to Europe.

We need not dwell on Mr. Saintsbury's astonishing industry or the perseverance that must have been needed to carry through a work like this. It was in some ways a thankless task to undertake. Few have suffered more at the hands of his own critics than Mr. Saintsbury in his literary career. He is continually assuring his readers (or rather, one supposes, his critics) that he has really read all these works of all ages and in several languages, the mere bibliography of which would fill a volume. He realized, too, that, besides his scholarship, his point of view laid him open to the unfriendly. So few people like pure criticism as much as he does. They prefer it "allayed and sweetened by sentimental, or political, or religious, or philosophical, or anthropological, or pantopragmatic adulteration" (p. 543). They like the sort of criticism they get in the *Spectator*, that "very respectable newspaper," as Mr. Saintsbury calls it, and they adored R. H. Hutton, who is his *bête noire*. Mr. Saintsbury is still smarting from the reviewers of his first two volumes, and constantly protects himself in footnotes which spike the guns of a reviewer who should suspect him not to know what he only omits.

The style of the volume is deplorable. A good instance of Mr. Saintsbury's manner is his saying of Milman: "He manages to be as little literary as is possible, and rather less than one might have thought to be; and his much better known Histories are not more so" (p. 621). As we have seen

above, he will suddenly drop into another tongue, as on page 515, where he says, "*Vixere fortes post* Mr. Arnold; let us hope that *vivunt*." On page 512 he tells us that "there is much more, as well as some, if not quite enough, performance." See, too, the amazing note to page 139. He uses terrible phrases, such as "judge just judgment," "among society" (which reminds one of Scott's "among bubbling blood"), "very mainly," "very most impossible," and words like "unicity," "inamoration," "disrealize," which have been used either not at all or as conceits by seventeenth-century writers. His offences against taste are of various kinds; perhaps the most exasperating is his reference to great men by their Christian names. He prefers to call Wordsworth "W. W.," Hugo "Victor," and so on. The climax of absurdity is in a footnote to page 127, which reads simply, "*v.* Victor upon William," and leaves the reader under the necessity of hunting in the text to discover that he means Hugo and Shakspere. On page 100 a quotation from Euripides is misspelt.

YOUNGHUSBAND IN MANTCHURIA.

The Heart of a Continent: A Narrative of Travels in Mantchuria, across the Gobi Desert, through the Himalayas, the Pamirs, and Hunza, 1884-1894. By Col. Francis Edward Younghusband, C.I.E., Indian Army, British Commissioner for Tibet Frontier Matters. Charles Scribner's Sons. 1904.

The prominence of Col. Younghusband in connection with the recent expedition to Tibet, as well as the renewed interest in the whole region traversed, amply justifies the republication in cheaper form of the volume issued several years ago, and but summarily noticed by us. The explorations in Mantchuria were made in 1886, long before the Russians had thought of occupying the region. During that time Col. Younghusband accompanied Sir Evan James, whose book, 'The Long White Mountain,' was the best guide to Mantchuria up to the time of the Russian occupation. Indeed, no one else has traversed Mantchuria more thoroughly than did these pioneer explorers at a time when it was practically a closed country.

For full details of their remarkable journey, Mr. James's book must be consulted; but the brief account of it given by Col. Younghusband is sufficiently full for ordinary purposes, and is replete with both interesting and valuable information. One is surprised to find the extent to which the Chinese, even at that time, were not only importing, but manufacturing, arms of the latest pattern. At Kirin, native superintendents and workmen were turning out, without any European guidance, magazine rifles, Gatling guns, and field guns "in a very creditable fashion." The Chinese manager had actually invented new machinery and a magazine rifle. The heavy guns manufactured here were found mounted at Sansing and other places, whence they had been carried by great effort during the winter season, when snow covered the ground and frost congealed the swamps and marshes over which they had to be dragged. In the various fortifications in Mantchuria, as later upon the western borders of Mongolia, there was nothing really lacking upon the part of the Chinese, except their fatal inattention to details in the preservation of their arms. The rifles and guns were everywhere allowed to rust, so that, when brought into use, they uniformly failed to accomplish their purpose. These facts are a warning to all European nations of what may happen when the Chinese catch the spirit which is now animating the Japanese, and give themselves in earnest to the perfection of their military organization and discipline.

Col. Younghusband was greatly surprised, both in Mantchuria and throughout his long travels,

"to find what good fellows the Chinamen could be amongst themselves. Seeing only the lower classes, the mule-men, the loafers of the street, and the frequenters of the inns, one is apt to form a very unfavorable impression of the Chinese, and to regard them as a rude, coarse, and unmannerly race, who hate strangers and take little trouble to disguise their feelings. But when one can see the Chinese gentlemen at home, one modifies this impression very considerably. . . . The general impression among Europeans is that Chinamen are cold, hard creatures who have not a laugh in them. . . . Of course, in conversation with Europeans they do not excel; they are lamentably ignorant of geography, for instance, and they generally annoy the stranger by asking if his country is tributary to China. But in the conversation carried on amongst themselves there seem to be many topics quite as good as geography and the weather, and one hears long, well-thought-out and well-expressed arguments on philosophic and moral subjects, freely interspersed with quotations from their classics. A Chinaman is perhaps rather too celestial, rather too much up in the clouds, and above ordinary mortals, and certainly shows too little interest in the common, every-day affairs of this world; but he is an interesting man to meet at home, and, mingled with the irritation which his superciliousness so often inspires, I often had a feeling of real regard for a man who can aspire to such a lofty standpoint as the Chinaman does, and in his case I felt that it was not all simple self-conceit, for he had in him the pride of belonging to an empire which has stood intact for thousands of years, and which was approaching civilization when we ourselves were steeped in barbarism" (pp. 19-20).

The author's observations upon traffic in Mantchuria furnish important facts for reflection to the numerous editors and correspondents who are indulging in forebodings of evil to the Russian army in Mantchuria on account of the inability to bring them supplies over a single-track railroad five thousand miles in length. The truth is, that the region occupied by the Russian army is one of the most fertile in the world, supplying a superabundance of food for both men and animals. The exports of food products from Niu-Chwang have annually been far more than enough to supply both the Russian and Japanese armies.

"The traffic in this winter season was wonderful. I counted in a single day's march over eight hundred carts, all heavily laden and drawn by teams of at least two and many of them nine animals, ponies or mules. A main road in Mantchuria in the winter is a busy scene, and these strings of carts going along on the frosty morning, with the jingling bells on the teams, and the drivers shouting at their animals, were signs of life and animation which we had hardly expected to see after our first experience of the heavy, muddy roads in the summer. . . . I remarked, too, how very well the carters fed their animals. . . . They are given in the day as much as sixteen pounds of grain, besides bran and chopped millet-stalks. . . . Grain, of course, was very cheap and plentiful, but in no other part of Asia have I seen animals so well fed as in Mantchuria, and the result was that their owners could get the fullest amount of work out of them, so that two animals would draw their twelve hundred pounds of goods for thirty miles a day without difficulty" (pp. 42-43).

On April 4, 1887, Col. Younghusband set out with two Chinese servants, one of whom left him in a short time, to make his way across the Gobi Desert to Kashgar and Yarkand, and thence over the Himalayas back to his station in India. So few have ever been over this route that the record of his travels is still one of the best sources of information concerning the region. It is only as the reader follows him slowly across the vast stretches of the desert region in central Asia that he gets any proper conception of the energy which has been shown for many centuries by the Chinese Government in maintaining its authority upon the western border of its empire, and of an equally restless energy which has characterized the merchants, mostly Mohammedans, who have all along kept up an active trade between eastern Turkestan and not only China, but India and Persia, and the whole region to the west of the Tian-Shan Mountains. Two great caravan routes lead westward and northward from western China. One, starting from Kalgan and proceeding northward to Siberia, reaches Lake Baikal at a distance of about one thousand miles. Half way, however, a branch turns off to the west, and, passing through Kobdo and crossing the Altai Mountains, reaches Semipalatinsk after going fifteen hundred miles farther. The line of camels traversing these routes is almost continuous. The traffic carried on by this means between China and Russia has, for centuries, been really enormous, and explains the anxiety (which has been little understood by Western nations) on the part of Russia, to maintain amicable relations with China; explains, also, to some extent, the great influence which Russian diplomatists have exercised with the Chinese authorities. The opposition by the central Russian Government to the expansive policy of Muravieff fifty years ago in acquiring the Amur, and of Alexieff during the last decade in getting a foothold in Mantchuria, has been largely due to the fear of incurring the ill-will of the Chinese along the extensive border separating China from Russia and central Asia, and of interrupting this friendly traffic.

The more southern caravan route, which was followed by our author, is longer and through a more inhospitable region, and is less used than the northern, until one reaches the southern border of the Tian-Shan Mountains. After going about six hundred miles from Pekin to Quei-hwa-cheng, our party reached the real starting-point of the caravans from China to western Mongolia. The account of their tedious journey for thirteen hundred miles across the first stage of the route till they reached the eastern point of the Tian-Shan Mountains, though rather monotonous, is by no meant devoid of interest; in fact, it is interesting partly because of its monotony. Upon the ninety-fifth meridian, the eastern extension of the Tian-Shan Mountains was reached, and a new stage of the journey begun. For more than a thousand miles the course led westward along the south-

ern base of these mountains, and across the innumerable streams which come down from the vast mountain mass, spreading verdure for a considerable distance on each side of their banks, and then disappearing in the desert sands. This alternation of verdure and desert sands is peculiar to travelling in central Asia upon both sides of the immense mountain system which traverses the continent. If the water of these streams were all utilized for irrigation, the capacity of the country for the support of population would be vastly increased. Indeed, few Westerners have any adequate sense of the immense resources of this region which are now largely running to waste. The Tian-Shan Mountains are estimated to contain thirty times the mass of the Alps. For more than a thousand miles their glacial-furrowed and snowy peaks, rising in Khan-tengri to 23,500 feet, form a cloud-like but permanent boundary to the horizon; while at their western extremity, as they sweep around the Pamir to join the Himalaya Mountains, they present to view a semicircle of lofty peaks of which the Alps in southern Italy are but a miniature. Many of their peaks rise above 20,000 feet, several to more than 26,000, and K.2, the second highest mountain of the world, reaches the height of 28,278 feet. The base of these mountains on either side is bordered by alluvial deposits which vie in richness with those of the Nile, and exceed them in extent many fold. The supply of water, moreover, is more constant than that of the Nile. Whereas the Nile is dependent upon the great lake reservoirs of equatorial Africa, which are somewhat oscillating in their level, the supply of water for the streams of both eastern and western Turkestan is kept in "cold storage" upon these immense mountain masses, and is let down upon the plains with uniform regularity as the spring and summer months advance. The conditions, indeed, are ideal for the support of a vast population and for a high civilization. It is only the chaotic state of the political and social conditions which keeps these regions in so backward a condition.

After crossing the Himalaya Mountains and returning to his station in India, our author was almost immediately commissioned to return to Yarkand, for the purpose of exploring the various passes across the frontier. This expedition occupied seventeen months. The two expeditions involved probably more mountain climbing in high altitudes than any other single explorer has ever accomplished. The lowest of the passes, the Shimshal, was 15,000 feet, while the Mustagh pass was 19,000 feet. It is difficult to see how such inaccessible passes as these can be of any particular military importance, when either side of the mountain is occupied by a strong force. The truth is, that the boundary between Russia, Mongolia, and India as now established is a natural one, forming a scientific frontier of defence; so that the alarm which is frequently spread over England at the occupation of these passes by Russia is groundless.

Space forbids further enumeration of the many interesting observations and experiences recorded in this volume. It remains only to say that the half-dozen illustrations are well chosen and finely executed, but that the map, while giving a general view of the whole region traversed, is so defective in the region of the Pamir as to be actually misleading.

TWO LACE BOOKS.

The Lace Book. By N. Hudson Moore. Frederick Stokes Co. 1904.

Lace: Its Origin and History. By Samuel L. Goldenberg. Brentano's. 1904.

Mr. Hudson Moore tells us in 'The Lace Book,' in a concise form, all that is interesting in the history of the evolution and production of lace in the countries which have given the world the finest examples of this delicate fabric. This handsome volume is illustrated with engravings from famous pictures of distinguished personages, showing how lace was employed in costume at different times; well-chosen, full-size examples are also given of the various kinds of lace; and an index endows the collector and connoisseur with a book of reference. Both type and paper are excellent, but the lace-like border in black and white to every page is extremely fatiguing to the sight, and could well be dispensed with.

Egyptian mummy-cases of the tenth century B.C. show the earliest origin of lace in their decoration with colored threads on flax cloth, in geometrical designs generally, and sometimes in inscriptions. Then came the togas of the Greeks and Romans, with their patterned borders in color or in gold thread. These, when they became worn and frayed at the edges, necessitated stitching across and embroidering the rough threads into some pleasing border, and from this the idea of lace as an independent form of adornment was evolved. The first meaning of lace in English was a cord or line of silk thread used to tie portions of clothing together—the doublet and hose, for instance, or sleeves to the body, or the stays and bodices of ladies' dresses. It is thus used in the Paston letters in 1469. Flanders and Italy have run pretty close to each other in the production of lace, and each lays claim to priority of invention; but it would seem that the earliest mention of this fabric is in the Italian inventories, and its primitive form was in gold and silver thread, in which the Italians certainly first excelled. Coarse threads of flax were afterwards woven in the same manner, and Italian point lace was reputed finer than any other, while the Dutch contributed more to the making of thread lace by the growing of flax and making of fine thread for this purpose.

The flax plant was brought from Egypt originally, and grown in Holland under the care of the best Dutch gardeners, whose aim was to attain delicacy of fibre and silkiness of gloss. Dutch flax became in demand all over Europe through its superiority to any other; it further went through many processes involving infinite labor and sacrifice of eyesight before it became the precious Brussels thread which fetched the price of $1,200 a pound. We are told that to keep the thread moist, so that it should not break, it had to be spun in underground rooms with artificial light; the thread could be twisted only against a black cloth. Flanders, according to our author, cannot substantiate its claim to have been the inventor of pillow-made lace, there being no pattern books published before W. Vosterman's, about the middle of the sixteenth century, and that of Jean de Glen a little later, and in neither of these are there patterns for bobbin-made laces, while in an old Italian inventory of the Sforza sisters of 1493 the following item occurs: "A band of work done with twelve bobbins to trim a sheet."

One of the chief uses to which lace has been put, from its earliest beginnings to our own time, is the decoration of Church vestments and properties, so that all over Europe the richest stores of every variety and provenance are to be found in old cathedrals. Besides robes of the priests and dignitaries of the Church, the saints and madonnas were also decorated with the most splendid and costly lace fabrics, the homage of their devotees. Some of the images of saints were so rich in those garments that they wore a different one each day for high mass, after which they were carefully put away in the sacristy. Even as recently as the jubilee of Pius IX. (June, 1871) the bronze statue of St. Peter in St. Peter's at Rome was attired in an alb and stole of old Venice point lace, with gold embroidered cope, fastened by a clasp of diamonds. We are told, with reference to princely gifts, of a dress of Alençon lace which the Emperor Napoleon III. presented to the Empress Eugénie worth 200,000 francs, which she gave to Pope Pius IX. to be converted into a rochet.

A large quantity of the finest laces were made in Italy in the convents and similar institutions, and some by bodies of paid workers. The Béguinages in Flanders also produced a good deal, but the great ladies of both countries in their homes devoted much time and labor to the finest work in lace to decorate the altars and vestments of their especial churches, and had their handmaidens taught to help them. We are told that in ecclesiastical families the laces belonged to the members of the family, not to the individual, and have thus accumulated into valuable collections. The captive Mary Stuart beguiled the weary hours of imprisonment by making incredible quantities of lace, designing the patterns herself from nature—of birds, fishes, beast, and flowers. It was only among the nobles and those in high position that lace was used. To quote Hudson Moore:

"From the cradle to the grave there was no place or occasion where lace was not worn in profusion, the only limit being the ability of the wearer to gain possession of it. The once beautiful Aurora von Königsmarck, whose form has become the color and consistency of leather, lies in her coffin completely enveloped in folds of costly lace. She left directions that no expense should be spared to purchase Point d'Angleterre, Malines, or guipure for the last adornment of her body, and the jewels also coffined with her are worth a fortune."

This preoccupation for post-mortem finery seems to have been shared by others, for we read of the Duke of Alva (who died in Paris in 1739) being buried in a shirt of finest Holland, trimmed with new point lace, a new wig, a new coat of Vardez cloth, embroidered in silver, and a cane and sword on the right and left side.

Before what we call lace was known, both in Italy and in Flanders very beautiful cut-work was in vogue. It is interesting to note how, when the different styles of lace are divided into periods, the dates in Italy and Flanders are approximately the same. The geometric or Gothic period without brides prevailed from 1480 to 1590. Floral forms held by brides then came in fashion,

the heavy character of the lace rendering the brides necessary. At this time "modes" began to be introduced (the filling-in stitches were thus named), and until 1670 the development and elaboration increased —heads, figures, birds, and even scenes came into the design, and meshed or net grounds were in use. From 1720 to 1780 the fashion of little bouquets, sprays, flowers, leaves, buds scattered over the ground, was prevalent, and has since been copied to this day, so appropriate do they seem to lace fabric. It was Catherine de Médicis's arrival in France which turned the attention of that country to the production and general use of lace. She brought with her only the primitive forms then in vogue, but France kept pace with the development of lace in Italy. It was a moment when dress was much thought of; the Valois indulged in every costly extravagance of costume. It is stated that at the meeting of the States of Blois, Henry III.'s robes were trimmed with 4,000 yards of pure gold lace. The accounts of the Queen of Navarre exhibit items for cut-work, passements, points for handkerchiefs and rabats, for collars, towels, and lace for sheets, which show that the ten edicts issued during the reign of the Valois to restrain extravagance in dress were of little avail as to their own practice.

It was in 1665 that Colbert started a lace factory at his château of Lonrai, near Alençon. Thirty Venetian women were brought over by him to teach the art in this factory to French workers. This enterprise is generally connected with the name of Madame Gilbert, a native of Alençon, who was at the head of the establishment, and who had learned to make the famous rose point previously in Venice. The lace produced here was called Point de France, and later, under the encouragement of Louis XIV., who published an edict forbidding the use of any other lace in his court circle, was perfected the famous Alençon lace. The burning of 100,000 crowns' worth of Point de Venise and Flanders lace by the hangman publicly in 1670 enforced the King's decree. Alençon lace, however, is equally well made in Venice at the present time, and other laces also are equally well made in Venice, Flanders, and France. Spanish Point especially was largely produced in Flanders and France and smuggled into Spain in quantities, the duty having been raised from 25 to 250 reals per pound. There were no lace factories in Spain; the lacemakers worked at their own homes. The famous gold or silver Point d' Espagne, of which vast quantities were used by Spanish nobles, was made chiefly by the Jews, and its production decreased considerably after their expulsion in 1492. Mr. Moore furnishes complete lists, with descriptions, of each well-known kind of lace made in Italy, the Low Countries, France, England, Ireland, Spain, and Portugal, and his book is full of interesting historical detail connected with the subject.

The author of 'Lace' had in view to make a handy compendium serviceable for commercial purposes. The different kinds of lace are arranged alphabetically, with particulars as to their characteristics, their various subdivisions, and the manner in which they are made. The illustrations are especially clear and useful for purposes of lace study. The book contains much valuable information on machine-made laces, with diagrams and explanations of the lace and embroidery machines now in use. It tells also of the nets made for the foundations of certain kinds of lace. The opening article, treating of the origin and history of lace, affirms on the authority of Felkin that Barbara Uttman, in 1561, was the originator of pillow lace, and taught the peasantry living around the Castle of Annaburg, Belgium, where she lived, this new method, which soon spread through Flanders. Hitherto, all kinds of point lace had been made in the Italian fashion, with the needle and a single thread. We learn from Mr. Goldenberg that machine-made lace is at present vastly more important in commerce than hand-made, which remains a luxury within the reach only of the wealthy. In the United States, through the importation of foreign machines and workmen, attempts are now making to manufacture lace, but sufficient time has not yet elapsed to prove whether the experiment is likely to be successful.

The book is well adapted for its purpose, the enlightenment of "the busy man of affairs," but it is evident that our author is hampered by having to express his meaning in English, and sometimes fails to convey what he intends—for instance, when he says: "Modern real lace is artistic, even superior, but compared with such few specimens as have come down to us of the work of the lace-makers of old, its deficiency, particularly in the matter of the fineness of the execution and thread, is at once apparent." We fail to see, consequently, in what its superiority consists.

Economic Essays. By Charles Franklin Dunbar. Edited by Prof. O. M. W. Sprague, with an introduction by Prof. F. W. Taussig. The Macmillan Co.

Nearly five years have passed since the death of Prof. Charles F. Dunbar removed from the ranks of American economists one who was considered the Nestor of the guild. Great as was the loss of his influence as teacher and as editor of the *Quarterly Journal of Economics*, it was a matter for still keener regret that he had died without giving to the world more of the results of his scholarly researches in many fields, particularly in the financial history of the United States. His 'History and Theory of Banking,' his carefully prepared edition of 'The Laws of the United States relating to Currency, Finance, and Banking,' and the articles which he had contributed to the reviews, had given evidence of his quality and aroused lively anticipation of what was to follow. But the pressure of university duties, and, toward the last, failing health, made literary work increasingly difficult, so that the expected *magnum opus* never appeared.

The volume now before us brings together fifteen essays which had been published in various journals, chiefly in the *Quarterly Journal of Economics*, and adds thereto five others which have never before seen the light. With the former, the task of the editor was comparatively simple; the latter, by the pious care of a disciple, have been brought "as nearly as possible into the form which the author would have wished" to give them. The introduction by Professor Taussig, carefully avoiding mere eulogy, is the fit tribute of a student to a revered master. While the book cannot repair, except in slightest measure, the loss which economic science suffered in Professor Dunbar's death, it is a worthy memorial to one who contributed so much, as teacher, editor, and investigator, to the progress of economic study in the United States.

The mere review of the titles of the twenty essays contained in the volume shows at once the range of the author's intellectual interests and his special fondness for certain topics. The first four essays deal with the history of economic science in America, the academic study of political economy, the conflict between the classical and the historical schools, and Ricardo's use of the facts of economic life. They disclose the wide range of his reading, the clearness and sanity of his judgments, and the insight with which he could interpret both the past and the present of his science. The other sixteen deal with his favorite topics of banking, currency, and finance; and, while six of them treat of current problems—such as the bank-note question, the safety of our legal-tender paper, and the income tax of 1894—the other ten are devoted to the early history of banking or the financial history of the United States. Thus, while it does not do full justice to his attainments, the present volume gives sufficient evidence of Professor Dunbar's firm hold upon his science in its broadest relations, his skill in handling questions of the day, and his special aptitude for patient and fruitful historical research. And, after all, little more than this is given to men who can show a much larger and far more pretentious literary output.

The fifteen essays which this volume merely reprints are sufficiently well known to students, and require no further attention from the reviewer; but something should be said concerning the five now printed for the first time. The first two of these are devoted to the crises of 1857 and 1860, and, by their masterly handling of the many elements that entered into a complex financial situation, furnish the most valuable account of these episodes that has ever been published. The last three are fragments of a larger study "designed to present a history of the national banks." They treat, respectively, of the condition of the State banks in 1860, the establishment of a national banking system, and the circulation of the national banks from 1865 to 1900. While only the last may pretend to be exhaustive, all display the nice workmanship of the author, and must be reckoned with by him who would write the definitive history of our banking system.

If an adequate history of economic science in the United States is ever written, the historian will begin a new chapter at the year 1871, when Professor Dunbar entered upon his career as Professor of Political Economy at Harvard University. This event, followed as it was, shortly, by the appointment of Professor Sumner to a similar chair at Yale, gave the science an independent position in the oldest American universities, and had no small influence upon the future development of economic study in the United States. The 'Economic Essays,' with the other works that had preceded, are not a large output for thirty years of professorial labor; but they are enough to display the quality of the author, and to assure him high rank among American econo-

mists of the nineteenth century. Moreover, in these days when the stream of economic publications threatens us with a veritable deluge, the present volume is a welcome reminder that, after all, quality is far more important than quantity.

Studies in Virgil. By T. R. Glover. London: Edward Arnold; New York: Longmans, Green & Co. 1904.

In the long list of writings on Virgil and his poetry, Mr. Glover's new book deserves a high place. Nowadays every great teacher realizes that if the classics are to preserve even the place which they still hold in our schools and colleges, they must be more liberally taught than they used to be; that orthography, etymology, prosody, aye, and even syntax (we say it trembling), must be made the means to an end; and that this end should be the direction of the student's attention to the known value of the works which he is reading, and the awakening in him of some instinct for what is good and what is not good as literature in them. Many teachers, especially of the older school, while fully alive to this requirement, are honestly at a loss how to fulfil it. To such, and indeed to all lovers of Virgil, this book may confidently be recommended.

It falls naturally into four parts. The first is a chapter on the age and the man, and in it we are shown how Virgil, himself the child of a darker period, had a vision of a brighter day to come, and taught his countrymen to look forward hopefully to the age which was opening before them. The next consists of three chapters of literary studies: the first treats of the literary influences to which Virgil was subject, the second of his contemporaries, and the third of the growth of the myths about Æneas. In these chapters we find no rehash of parallel passages, no dull collection of words or verses or episodes which Virgil drew from this or that earlier poet, but the question of literary influences is treated in a far broader and more intelligent manner. How far, it is asked, did this or that poet influence *the mind* of Virgil?—more, for instance, than North's Plutarch influenced the mind of Shakspere? Was the poet's outlook on life affected? Did his habitual mode of expressing himself become a mere repetition of the thoughts and the language of others? When such is the issue of literary influence, we feel what Carlyle meant when he spoke of imitation as among the deadliest of poetical sins. But when this is not the case, as Mr. Glover shows it was not with Virgil, then "we realize the substantial truth of Goethe's dictum that 'to make an epoch in the world two conditions are essential—a good head and a great inheritance.'" And elsewhere Goethe added another necessary constituent which was also a part of Virgil's endowment for poetry—love.

The third portion of the book deals, in three chapters, with the land and the nation, the three topics being Italy, Rome, and Augustus. Here we see how "Virgil gave for the first time its literary expression to the triumph of a nation, politically, racially, and geographically one, over the clan and over the city-state," and how he "did for Italy, in some degree, what Scott did for Scotland." On the other hand, his earlier deification of the man Augustus—that "shrewd and successful adventurer, who lived by assimilating the ideas of his uncle"—is conceded to be untrue and universal poetically, and his introduction of Augustus into the Æneid, though prompted by honest motives, is held to be a failure to achieve the highest poetic truth. The last part of the book is on Virgil's interpretation of life, and here we have chapters on Dido, Æneas, Hades, and Olympus, and a final summary. Of these, the chapter about Dido is perhaps the best in the book, and certainly it is one of the most interesting and sensible essays on that famous episode of the Æneid which we have ever read. Nor, in saying this, do we forget Heinze's recent pages in his 'Epische Technik.'

The chapter on Æneas is unconvincing, and almost a failure. On other lines than those of Mr. Glover must the character of that truly unmodern hero be defended, if indeed it can find defence at all with any who are not saturated with ancient ideals. The chapter about Hades was apparently written before the appearance of Norden's recent edition of the Sixth Book. His views, as previously expressed in periodic literature and cited now and then by Mr. Glover, have since undergone considerable modification under the fire of criticism, and this chapter, if ever rewritten, may be much improved by a reconsideration of them. Neither do we care much for the last chapter, in which it is asked how far Virgil realized wherein the problem of the universe consists. But as a whole the book ought to of great assistance to all who wish to get a true conception of the powers and the weaknesses of the greatest of the Roman poets—that one who, more than all the rest, influenced the succeeding literature which is our heritage.

American Estates and Gardens. By Barr Ferree. New York: Munn & Co. 1905.

This is a competent book, but its title is misleading, since it has for its subject those palatial country houses of which so many have been built in America within the last fifteen years. The desire to escape from the city and to live among rural surroundings for at least a part of the year, has taken strong hold upon our people. The wealthy can readily gratify this desire, and so it comes that millionaires by the hundred, and multi-millionaires by the score, have of late bought estates, built houses, and laid out gardens. Why their private houses—country houses in a democratic community—should generally wear an air of sumptuousness and have a distinctly palatial quality, gives food for thought. Enough that, whether we judge them from the many excellent photographs given in this book or from Mr. Ferree's descriptive text, they are for the most part frankly palaces, and palaces that speak as little of their owner's taste, his habits of life, his personality, as do those miles of gilded and be-mirrored apartments that are a weariness to the soul and body of the sight-seer in Europe.

But if the houses say nothing about the owner (except that he is very wealthy), they are eloquent of the training and the technical skill of the men who have designed, decorated, and furnished them. If we are left with a desire for more individuality, for a certain domestic charm that is missing, we could not ask for more stateliness, more splendor, more elaboration. All art demands a choice between the free, the picturesque, the romantic—call it what you will—on the one hand, and the formal, the academic, on the other. The American millionaire (or, more truly, his architect acting as the arbiter of his taste) has very definitely decided that his country house shall be in the latter mode, and if we may judge from the few examples of the other given in this costly volume, that decision is something for which we may be profoundly thankful.

As an accompaniment of our great modern country houses, a garden is almost invariably present, and, fortunately, we at last find it treated as an important factor in the design. Garden designers, whether architects or others, become more and more capable year by year, yet how gladly would one welcome signs of the master's interest in his garden rather than evidence of mere ownership. If our author neglects estates, he deals adequately with gardens, many of his most charming illustrations being drawn from such splendid examples as those of Bellefontaine and Falkner Farms. Whether we regard his book as a record of contemporary domestic architecture of a certain sort, or as a contribution to sociology, it will be of scarcely less interest a hundred years hence than it is to-day.

Books Which Are Worth While

THE RIGHT LIFE SERIES

A series of small, easily read books intended to furnish material for settling the convictions of thoughtful men upon questions which are uppermost to-day. What are we to believe? What is the Right Life? What are we to think of the Bible to-day? What are the ethics of business? How should religion be taught?—and the like. They are written by men of large experience, giving expression to the best convictions of their lives, which, while representing the latest scholarships, are readable and throughout interesting. It is a series dealing with practical every day matters in the freshest and most thoroughgoing fashion. The authors will include some of the most notable figures in American intellectual life.

THE RIGHT LIFE and How to Live It

By Henry A. Stimson. 12mo, cloth, $1.20 net. With an introduction by William H. Maxwell, City Superintendent of Schools, New York. The First Book in the Right Life Series.

A modern, every-day book, suggestive, practical, helpful, which brings home the spiritual side of life with peculiar closeness to parents, teachers and young men and women.

President Arthur T. Hadley of Yale University says, in a letter to the author, "If the young men and women of the next generation could be permeated with the views and ideals which underlie this book it would be a most useful thing for their conduct and their character."

Dr. Alfred E. Stearns, Principal of Phillips-Andover Academy, says: "The book is a real treasure. I shall recommend it."

(OTHERS IN PREPARATION.)

"The first complete contemporary account of De Soto's famous expedition."

NARRATIVES OF THE CAREER OF HERNANDO DE SOTO
FROM FLORIDA TO THE MISSISSIPPI RIVER

Told by the Gentleman of Elvas, by Biedma, and in the newly-translated account of Ranjel, De Soto's private secretary. Edited and introduced by Professor EDWARD GAYLORD BOURNE, of Yale University. In the Trail Makers Series, under the consulting editorship of Professor John Bach McMaster. 12mo. Cloth. With illustrations and maps. In two vols., $2.00 net.

(Circulars of the Trail Makers, a Library of History and Exploration, on application.)

THE TRAIL MAKERS

With Introduction, Illustrations and Maps. Each 12mo. $1.00 per volume.

THE JOURNEY OF CORONADO, 1540-42. From the City of Mexico to the Buffalo Plains of Kansas and Nebraska. Translated and edited, with an introduction, by George Parker Winship.

MACKENZIE'S VOYAGES. Two volumes.

BUTLER'S WILD NORTHLAND.

THE LEWIS AND CLARK JOURNALS, Complete in three volumes. With an account of the Louisiana Purchase by Prof. J. B. McMaster and an identification of the route.

COLDEN'S HISTORY OF THE FIVE INDIAN NATIONS. Two volumes.

HARMON'S JOURNAL OF VOYAGES AND TRAVELS.

LIVES OF GREAT WRITERS

IN THE DAYS OF SHAKESPEARE

By TUDOR JENKS. A personal picture of Shakespeare at Stratford and in London, based on the best knowledge available regarding his life and times. This story of his life is told with a freshness, personal quality, and also a succinctness which make the book wholly individual.

IN THE DAYS OF CHAUCER THE STORY OF HIS LIFE AND TIMES

By TUDOR JENKS. With an Introduction by HAMILTON WRIGHT MABIE. 12mo. Cloth. $1.00 net. (Postage 9 cts.) Already in use at Smith College, and elsewhere.

Dr. A. J. George, Professor of English in the Newton High School, says: "It is a great delight to read a book like Tudor Jenks's 'In the Days of Chaucer,' full of the tonic of the great poet's life and art. Pupils will read it as they read romance, and through it will be led to make a closer acquaintance with that wholesome, happy, and large-hearted story-teller—Chaucer."

In preparation: **"IN THE DAYS OF MILTON."**

BOOKS WHICH PEOPLE ARE READING

"A novel of the most sensational episodes."—From an advance notice in *The Bookman.*

THE WHITE TERROR AND THE RED

A Novel of Revolutionary Russia. By A. CAHAN. 12mo, cloth. $1.50.

A NEW NOVEL BY THE AUTHOR OF "TO WINDWARD"

THE WANDERERS

By HENRY C. ROWLAND. 12mo, cloth, with Frontispiece. $1.50.

READY EARLY IN MARCH

THE UNWRITTEN LAW

A Novel, by ARTHUR HENRY, author of "The House in the Woods," "An Island Cabin." 12mo, cloth. $1.50.

THE UNWRITTEN LAW, a story dramatic and intensely human, is, in many respects, a departure from traditions governing our fiction. It pictures the play of ambition, love, religion, friendship and passion in the society of this day and country, with a fidelity and fearlessness unusual in our novels. It is justified by the scope of the book, its force, its appeal to sympathy and the truth, it reveals. In these pages people act and speak and think, they suffer and find delight, they succeed and fail, not according to artistic and orthodox theories, but as they do in life.

Breaking the Wilderness

The Conquest of the Far West, from the Wanderings of Cabeza de Vaca to the First Descent of the Colorado by Powell.

By F. S. DELLENBAUGH, author of "The Colorado River," etc.

8vo. Fully Illustrated. Net $3.50.

"A review of the important events which contributed to breaking the wilderness that so long lay untamed west of the Mississippi."

The Old Shipmasters of Salem

With mention of Eminent Merchants. By CHARLES M. TROW. 8vo. Illustrated. Net $2.50.

A vivid picture of Salem at the height of its prosperity.

De Profundis

By OSCAR WILDE. 12mo. With portrait. Net $1.25. (By mail $1.35.)

Written while in prison, *De Profundis* contains, probably, the most sincere and personal expression of the author's artificial and sensitive nature.

Modern Civic Art

The City Made Beautiful

By CHARLES M. ROBINSON, author of "Improvement of Towns and Cities," etc.

New Edition with Illustrations.

Net $3.00.

"There is hardly a matter concerning the adornment of the city that is not discussed—a strong plea."—*Chicago Tribune.*

Les Classiques Français

Edited by H. D. O'Connor, with Critical, Biographical and Bibliographical Notes. 16mo. Full leather. Each $1.00 net.

1. Atala, Réné et Le Dernier Abencerage par Chateaubriand.

2. Contes Choisis d'Honoré de Balzac.

The Kaiser as He Is

Or, The Real William II.

By HENRI DE NOUSSANNE. Translated by Walter Littlefield. 12mo. Net $1.25.

A witty, keen and incisive arraignment of William II. of Germany. A brilliant commentary on a brilliant man.

The Story of The Congo Free State

Social, Political, and Economic Aspects of the Belgian System of Government in Central Africa. By HENRY WELLINGTON WACK, F.R.G.S. 8vo. With 125 Illustrations and Maps. Net $3.50.

The true story of the Congo, the romance and the tragedy of its conception and of its marvellous development.

Thomas Cranmer

And the English Reformation. 1489-1556

By ALBERT F. POLLARD, F.R.H.S.

12mo. Fully illustrated. Net $1.35.

No. 6 in *Heroes of the Reformation.*

The figure of Cranmer is not heroic, but Mr. Pollard has put it in a new and much better light; in fact, he has made a noble contribution to English Church History in a critical period.

Daniel Webster

The Expounder of the Constitution.

By EVERETT P. WHEELER. 8vo. Net $1.50.

A consideration of Webster's arguments on questions of constitutional and international law

WANTED.—A TEACHER OF SCI- ence with capital to buy part interest in a prosperous Boys' Preparatory School. Send full particulars as to qualifications and reference to E. L., care of The Nation.

Resorts.

ROSEVILLA, NEUCHATEL, SWITZERLAND

Beautifully situated above the lake with wide view of the Alps. Large shaded grounds. A quiet, attractive Swiss Pension. Open all the year. House heated by hot water. Address

Mesdemoiselles Guillaume, Neuchatel, Switzerland.
Or apply for information to
The Misses Kirk, Rosemont, Pa.

FOR SALE

The well-known Villa Landor, Florence, Italy

With farm and gardens. Furnished or unfurnished Modern sanitary improvements, hot and cold water, acetylene gas, two furnaces, double windows, wire screens. For information apply to IRA A. PLACE, Grand Central Station, New York; or H. S. WHITE, Villa Landor, Florence.

Early Western Travels

1748-1846

A SERIES OF ANNOTATED REPRINTS of some of the best and rarest contemporary volumes of travel, descriptive of the Aborigines and Social and Economic Conditions in the Middle and Far West, during the Period of Early American Settlement.

Edited with Historical, Geographical, Ethnological, and Bibliographical Notes, and Introductions and Index, by

REUBEN GOLD THWAITES, LL.D.

With facsimiles of the original title-pages, maps, portraits, views, etc. Each volume, large 8vo, cloth, uncut, gilt tops. Price $4.00 net per volume (except the Atlas, which is $15.00 net). The edition is limited to 750 complete sets, each numbered and signed; but in addition thereto, a limited number of the volumes will be sold separately.

An Elaborate Analytical Index to the Whole

Almost all of the rare originals are without indexes. In the present reprint series, this immense mass of historical data will be made accessible through one exhaustive analytical index, to occupy the concluding volume.

"The books are handsomely bound and printed. The editing by Dr. Thwaites seems to have been done with his customary care and knowledge. There is no want of helpful annotations. The books therefore will be likely to be of more real value than the early prints from which they are taken."
—*American Historical Review.*

"The annotations are abundant and highly valuable."
—*The Nation.*

Full descriptive circular and contents of the volumes mailed on application.

VOLUMES NOW READY—"Midsommer Night's Dreame," "Love's Labour's Lost," "Comedie of Errors," "Merchant of Venice," "Macbeth," "Julius Cæsar" ("Hamlet" in March, other plays to follow). Price, in cloth, 50 cents net; limp leather, 75 cents net; postage, 5 cents.
Thomas Y. Crowell & Co., New York

A CATALOGUE OF OLD, RARE, and Curious Books relating to American and Local History, Genealogy, etc., can be had for the asking, of A. S. CLARK, 218 Washington St., Peekskill, N. Y.

"THE gay young baron's powers of observing man and nature were highly developed; unfettered by religious or political bias, he was a free lance in these particulars; he impartially judged both priest and official; his humor was deliciously caustic; he was keen as a critic and philosopher; his literary style, especially in the famous semi-satirical Dialogue with Adario, in the second volume — a searching criticism of the civilization and Christianity of his time — is classical in its directness and sparkling touch; from every point of view Lahontan is a charming raconteur, and appeals strongly to the modern reader."

IN THIS MANNER DR. REUBEN GOLD THWAITES CHARACTERIZES THE BARON DE LAHONTAN, WHOSE "NEW VOYAGES" HE HAS EDITED FOR *McCLURG'S LIBRARY REPRINTS OF AMERICANA*

Lahontan's New Voyages to North America

An exact reprint of the English Edition of 1703, With Introduction, Notes, and an Analytical Index

By REUBEN GOLD THWAITES, LL.D.

And a Bibliography by Victor H. Paltsits.

With facsimile maps and illustrations. Two volumes, square 8vo, boxed, $7.50 net.
Large-paper edition, limited to 75 numbered copies, on Brown's hand-made paper, illustrations on Japan, boxed, $18.00 net.

The reproduction of this highly readable and virile classic in a beautiful, well-appointed, and well-edited edition, is a service which will greatly interest historians, librarians, scientists, and the general reader who is fond of a stirring tale of adventure on the confines of civilization. It is in any of its original forms a scarce and costly work; and no edition of the English version of 1703 has appeared in complete form since 1735.

Published February 25. Send for Complete Descriptive Circular.

The Nation.

NEW YORK, THURSDAY, MARCH 2, 1904.

The Week.

It is of course unfortunate that the Swayne impeachment should have been decided by so nearly a party vote. As one close student of the case remarked, enough evidence was collected against the Judge "to blackball him in a club." But it was straining the facts to call him guilty of high crimes and misdemeanors, and invoke the extreme remedy of the Constitution against him. There were not a few able members in both houses who honestly thought the abuses justified impeachment, but, as a body, the House did something very like leaping before it looked. The testimony, as in all such cases, was voluminous, and only a handful of members had read it through. On the only charge sustained by all the members of the House committee, it appeared that some of the most distinguished members of the Federal bench would have been equally guilty. Partisanship has been disclaimed by every one in considering this case, and yet, at every stage, nearly all the Democrats have voted one way, and most of the Republicans the other.

San Domingo topsy-turvydom is forced upon our attention again by the attempt to assassinate President Morales. He, like all his predecessors of recent years, is on a perilous eminence. Having mounted to it by dishonest methods and violence, he knows that he may be thrust down at any moment by conspirators more bold and unscrupulous than himself. Hence his eagerness to be safeguarded by the United States. Morales, of course, is "the Dominican Government" of which the treaty gravely speaks. It is he who invites innocent Uncle Sam to come in and protect him from the foes of his own household. That on one side. On the other, the San Domingo Finance Company, with that guileless politician, Smith M. Weed, as its President, is quietly standing by, waiting for our Government to guarantee it profits of who knows how many per cent.? Meanwhile, at the State Department, the rest is silence. Mr. Hay, keen on literary mysteries as he is, has not yet run down the author of the lawless and now disavowed "protocol" of January 20. Who authorized it to be signed? Did Mr. Hay? If, not, have we another case of "Loomis, Acting"? These questions will have to be answered sooner or later. The Senate is in duty bound to call for the correspondence. And the affair would have a better look if the Administration frankly took the public into its confidence, instead of waiting to have the truth dragged out of it.

What impression the San Domingo proposals make upon clear-sighted foreigners, may be seen in the article of Pierre Leroy-Beaulieu in the *Économiste Français* of February 4. He says with much force that all the disclaimers about intending no permanent control of Dominican territory go for nothing in view of the obligations actually assumed. "Though the word protectorate is not written in the agreement, and though great care is taken at Washington not to utter it, there can be no doubt that the thing is present." M. Leroy-Beaulieu also singles out the real gravity of our light undertaking to pass upon the justice of foreign claims against San Domingo. As Sumner said that Grant's treaty of annexation was a plan to "buy a revolution," so President Roosevelt's proposal is to buy a whole line of lawsuits and causes of international friction. To make ourselves not only an administrator in bankruptcy, but the sole judge of the rights of the creditors, is certainly, as M. Leroy-Beaulieu remarks, to embark upon a policy which would be "dangerous" in the end, if not immediately.

Ex-Secretary Long's warning against stretching the Monroe Doctrine too far, by setting up as general dun and collector of bad debts in this hemisphere, shows how the thought of serious men is turning against the Roosevelt plan of assuming the power of the purse in San Domingo. The art of government is foresight; and it is clear to sober minds that the Dominican hornet's nest is not the only one into which we shall have to thrust our hands if we once begin the process. It is with peculiar force and authority that Mr. Long also raises his voice against the President's headlong naval plans. At peace with all the world, and with the need of new taxes staring the Treasury in the face, this is no time to crowd on new construction. The ex-Secretary is wholly within bounds in saying that we have not the men, and with difficulty can get Congress to vote them, to man the ships. But that is just the way the little see-saw naval game is played. New warships are wheedled out of Congress, under solemn guarantees of limited cost, "just for this year," etc., and then the Department comes down with tearful pathos demanding more sailors. The big navy could discount the horse-leech in the game of extracting money from a befooled Congress.

"Never since the beginning of our country's history," said the President on Washington's birthday, "has the navy been used in an unjust war." But it was used in the Mexican war, which in Gen. Grant's deliberate opinion was "one of the most unjust ever waged by a stronger against a weaker nation." Mr. Roosevelt, of course, may dissent from that historical judgment. It may also be that he now scorns the notions of that other historian, Theodore Roosevelt, who, in his Life of Benton, spoke of the Mexican war as "a wrong," and recorded without disapproval Benton's denunciations of it. The absurdity of Mr. Roosevelt's insistence upon a large navy as the sole hope of peace appears at once if we but consider that England, Germany, and France are all steadily increasing their fleets, that Russia intends to rebuild hers on a gigantic scale, and that Japan will enlarge her navy to the extent of her resources. Three of the most powerful nations will soon be practically on a par in naval strength—France, Germany, and the United States—with England considerably in the lead; and Russia will doubtless catch up, so far as ships are concerned, within a few years. What then? Will the world's peace be really more assured by the existence of six great war fleets than it would be if there were none? If all the big nations are armed alike, where is the advantage? What Mr. Roosevelt cannot get into his head is the fact that his big-navy speeches are doing as much as anything else to cause European nations to increase their fleets. There is a good deal of loose talk about an alliance between the Anglo-Saxons, but it does not prevent England from matching every new battleship or cruiser we build with one slightly larger or more heavily armed. As is evidenced by the latest speech of the French Minister, France also does not intend to let us get ahead if she can help it. Instead, therefore, of this great nation setting the splended example it once did as the one beyond all others devoted to the arts of peace, we have become a chief reason why other nations should spend more and more millions upon their fleets.

What the big-navy men cannot deny is that a single new invention or development in marine engineering may consign our enormously costly fleet to the scrap heap without a moment's warning. The great lesson of the war in the East, according to the Navy Department, is the triumph of the battleship. But, to unbiassed outsiders, it is the victory of the floating mine, which has inflicted all the losses the Japanese have suffered. Togo's fleet did not sink a single ship by gun fire in the battle of August 15, and could not reach a single ship in the harbor of

Port Arthur, on account of the coast defences and floating mines, until the *Sevastopol* was driven into the outer harbor by the shells of the army. Take the turbine engine, for example. If the new Cunarder equipped with this machinery achieves twenty-six knots an hour, as is confidently expected, there must be a revolution in naval engineering. This vessel will be an auxiliary cruiser, and as such will be capable of running away from any battleship or cruiser afloat. Her existence will so "menace our commerce" that we shall at once be informed of our duty to produce naval vessels of similar speed. Thus far our naval engineers have only tentatively considered plans for turbine engines in one scout vessel. They may suddenly find themselves compelled to adopt them for all ships within the next five years.

We quoted last week the extraordinary remarks about international arbitration attributed to Mr. Roosevelt by the *Gaelic American*. The current issue of that paper reaffirms his opposition in 1897, and says:

> "The committee that waited on Mr. Roosevelt, of which the editor of the *Gaelic American* was one, are all alive, and their recollection of the occurrence is very clear. Mr. Roosevelt used the words attributed to him, and he has no reason to be ashamed of them. Further than that, he was in the habit of using similar language, and that fact was largely instrumental in making him Governor of New York. It even held for him for President of the United States the votes of many Irish citizens, who refused to believe either that he had changed his mind or fallen under the dominion of John Hay."

The incident might be dismissed as simply another example of the President's facility in persuading those on opposite sides of public questions that he is enthusiastically with them both. It throws, however, a strong light not only upon his political methods, but upon the existing situation. As between arbitration and a fighting navy, both of which he professes to favor, who can doubt which is nearest his heart? His public approval of arbitration is perfunctory. It is the sort of insincere tribute that a first-class fighting man feels compelled to pay to civilization—meaning about as much as "The ladies, God bless 'em!" But the real and dominant attitude of Mr. Roosevelt is betrayed in his private remarks to the implacable Irishmen. We would not so wrong him as to hint that he was simply bidding for their votes when he said to them that he was "against arbitration between nations." He said so because in his soul he was against it; and he has not yet, like the more facile Lodge, "changed his soul."

That the President should have run foul of the Constitution in his attempt to make Senator Quarles a Federal judge is a mere incident—humiliating to Mr. Roosevelt, but not vital. The main interest of the appointment lies in its bearing on the factional politics of Wisconsin. Because the Senate, during Mr. Quarles's term, increased the salaries of district judges, he is not eligible to appointment until after his Senatorial term expires and (by the same token) that of La Follette begins. It is probably better on all accounts that the almost unavoidable clash between the two Wisconsin Senators should take place over a matter of importance rather than degenerate into a petty squabble over some second-class postmaster, though every one must regret seeing the national judiciary involved in a fight of this kind. The President has had two judicial vacancies to fill in Wisconsin. To one he appointed Senator Spooner's former law partner, and for the other he has selected the Senator whose reëlection was made one of the chief campaign issues of the defeated Spooner faction. These appointments agree very well with the reports that, in spite of the fact that he and the President are both fighters of Trusts and curbers of railroads, La Follette will not find the atmosphere at the White House altogether congenial when he arrives at Washington. That La Follette would rather have Quarles on the bench than in active politics is hard to believe. While he has been a creditable Senator in every way, he never was a party leader of whom La Follette had any reason to be afraid.

Among the most important steps in the President's education which the Senate has taken in hand, is the prohibition in the Indian Appropriation bill. Hereafter, the diversion of Indian funds to sectarian schools, which Mr. Roosevelt ordered, will be defensible by no such legal quirk as he resorted to. The general policy was as flatly declared by Congress before; but the President found a way, at the urging of the Catholics, to get around it. Now, however, all Indian moneys are put beyond his reach. Neither principal nor interest of the Indian trust funds can he touch. Mr. Roosevelt declared, in his apologetic letter on the subject, that he believed his course in the matter both wise and just; and added that he should persist in it, unless Congress should otherwise order or the courts find him in violation of the law. Well, he has now got his Congressional order, with its implied condemnation.

An instructive sequel of the Senatorial election in Washington, when Foster of Tacoma was succeeded by Piles of Seattle, is explained by the Washington correspondent of the Portland *Oregonian*. A few days ago the Postmaster-General announced that no postmaster would be appointed at Tacoma during the present session of Congress, but that after March 4 Henry L. Votaw, recommended by Congressman Cushman, would be named for the place. The term of the acting postmaster expired a year ago last December, and it then devolved upon Senator Foster to name his successor; but, with this year's struggle for reelection to the Senate in mind, Foster took no action. Privately, he promised the place to a member of the Washington Legislature on the tacit understanding that the latter would stick by the Senator in his fight for reëlection. The recommendation for appointment was delayed, however, until the member should "make good." Representative Cushman took this little tale of shrewd Senatorial manipulation to the President, who promptly gave the order to hold the matter over until Foster had left the Senate.

The Senate has several times shown signs of wishing to rebuke the President for unnecessarily loading up the retired list of the army by retiring officers with advanced rank, bestowed for the purpose of getting them out of active service. Now, however, Congress has finally given him a free hand by agreeing to the bill to place Senator Hawley of Connecticut on the retired list with the rank of brigadier-general. A more inexcusable bestowal of a rich Government favor has not been seen since Representative Boutelle of Maine was made a retired captain in the navy when stricken with incurable disease. The retired lists were obviously not intended to be the refuge of aged or decrepit politicians. Mr. Roosevelt can, hereafter, point to the Hawley case whenever any one criticises his padding of the retired roll of either service. To make matters worse, the House, in agreeing to retire Senator Hawley, added an amendment similarly retiring Gen. Peter J. Osterhaus, one of the most gallant of our German-American civil-war generals. Neither of these men has been connected with the army since 1866; Gen. Osterhaus having lived in Mannheim, Germany, for the last thirty years. Senatorial courtesy will have a new meaning hereafter for Senator Hawley.

"Responsible government," Speaker Reed once wrote cynically, "is the thing which all Americans profess to believe in, but which no American would tolerate for an instant in practice." Certainly, its last vestiges seem on the point of disappearing at Washington. Even the Speaker's control of business was broken on Monday. Twice his own party, or enough of it in combination with Democrats to make a majority of the House and "vote down the organization," was deaf to his personal pleadings. Speaker Cannon had set the example, however. He is reported to have given

his pledge to President Roosevelt that he would get the two battleships through the House; anyhow, he quietly buttonholed Democrats and got them to rally in sufficient numbers to overcome the strong Republican defection on that question. But it was a dangerous precedent, and was turned unpleasantly against the Speaker himself. If he is ready to promote extravagance in naval appropriations, plenty are ready to get up their little cabals in favor of other forms of waste. But this is to make responsible government ridiculous.

Inquiry by the House into the Osage oil land leases is a timely recognition of responsibility. There is, apparently, a pressing need for bringing to the attention of the Indian Territory Illuminating Oil Company the principle of the "square deal." In approving a proposed compromise lease, to run from April, 1906, to April, 1916, and to cover 680,000 acres out of the 1,500,000 included in the reservation, Secretary Hitchcock recently denounced the old lease as "an unheard of monopoly." This instrument authorized the oil company to prospect over the whole Osage territory and to produce as much oil as it pleased, on condition that it should pay a royalty of 10 per cent. into the tribal treasury. Now the proposed new lease is identical in terms with the old, except that it is confined to somewhat more than a third of the reservation. But this 681,000 acres takes in every foot of really profitable oil land belonging to the tribe, so that we have in effect a renewal of the agreement objected to by the Osages. Their complaint is based on two grounds: They protest that a 10 per cent. royalty is not enough in view of the fact that the oil company exacts from the sub-lessees a royalty of 16 2-3 per cent. in addition to a bonus varying from $1 to $10 an acre. The imminence of allotment in severalty to the members of the tribe is another reason justly urged against a long-term lease which would impair the value of an Indian's individual holding.

All the testimony in the Colorado election contest is now in, and, with that rare impartiality and detachment of view which Rocky Mountain politics develop, the leaders of both sides have looked over the demonstration and found it absolutely conclusive. To the readers of but one Colorado newspaper, all is clear and simple; but the man so foolish as to attempt reading two, finds nothing but confusion. To begin with Denver, the Peabody handwriting experts identified 9,048 ballots as the work of a few hands. This number was within a thousand of Adams's plurality. But the Democratic witnesses identified an even hundred of these as their own bona-fide votes. To the Republican mind, this leaves the other 8,948 conclusively proved to be fraudulent, and fully justifies the rejection of the ballot-boxes. To the Democrat, it discredits the whole theory based on the expert testimony. The same thing would, however, apply to the testimony of Mr. Adams's experts, who have examined 4,405 ballots, among which 1,501 for Peabody were found to have been written by a few persons. According to the computation of his adherents, the net result of the long conflict of expert testimony is to leave an Adams plurality of 909. That is, he would win by that figure if the votes were thrown out bodily from all precincts, in and out of Denver, where frauds have been demonstrated by the experts of either side. Perhaps the most startling bit of evidence was presented week before last by the Democrats. They had called for the ballot-box from a certain precinct in Huerfano County, but there was much delay and difficulty in having it produced. It was finally brought before the Committee and opened, only to disclose the fact that it was entirely empty. From that precinct Peabody had been credited with 177 votes to 24 for Adams. This roughly summarizes the arithmetical side of the evidence. "A plague o' both your houses" must be the committee's feeling as it makes ready to report.

The proposed "grandfather clause" amendment to the Maryland Constitution, disfranchising negroes, has encountered some peculiar legal difficulties. It has not the approval of Gov. Warfield, and its promoters have contended that the assent of the Executive is not necessary at any stage in the process of making it a law. The Constitution provides that every amendment must be passed "as a bill," and the opponents of the suffrage change hold that this means that the Governor has the veto power. To test this contention, a friendly suit was brought last December. Now another point of a similar nature has been made. It is that, even supposing the amendment to be ratified by the people next fall, it does not legally take effect without the Governor's proclamation, and that the Governor could in no way be compelled to issue such a proclamation. This view is backed up by an old opinion by Judge Bryan, the father of the present Attorney-General. The friends of the amendment, according to this construction, might impeach the Governor, but no judicial process could force him to declare the amendment either adopted or rejected. The question is, of course, more or less academic, for it is very unlikely that any governor would exercise so doubtful a power, especially against a measure of his own party. But should the amendment be forced through by crooked methods, it is fortunate if the Governor has some discretion as to accepting the returns as they come from the judges of election.

The election in Philadelphia on February 21 was interesting chiefly from the participation of a new organization, the City party, which nominated candidates for Councilmen, and, endorsing two Democrats, put up three nominees of its own for the "minority" magistrates, of whom five were to be chosen. In this contest the machine was put on its mettle. Being entitled by law to only ten of the fifteen magistrates to be chosen, its object was to put the other five in the hands of Democrats instead of City candidates. Enough Republicans therefore threw their votes to the Democrats to accomplish this object. The *Ledger*, which estimates the number of illegal votes at 40,000 and declares that the "repeating zone" was extended to wards hitherto unmolested, finds some consolation in noting "results which are inspiriting at least in so far as they show what might be done under an honest electoral system." So far as the machine depended on argument at all, it used the familiar "defaming the city" cry. "As a matter of plain fact," said the *Inquirer* on the day before election, "Philadelphia is the most moral city of all the great municipalities, not only in the United States, but in the world." "Corrupt and contented" was Mr. Steffens's caption for his study of Philadelphia politics, and the city seems bent on living up to the description.

Mr. Wyndham, whose engineering of the Land Purchase act was a model of Parliamentary tact, has made it his care to maintain good relations with the Irish Nationalist party. To this end Sir Antony Macdonnell, Under-Secretary of the Lord Lieutenant, has kept in touch with the Nationalists, and in many ways has tried to persuade them that the Government is sincerely promoting their cause. Meantime, Mr. Wyndham and others, while condemning the Home Rule heresy, have talked wisely of "devolution of power." Some of this power, according to Sir Antony Macdonnell's plan, was to be devolved upon semi-elective councils. To this scheme, for which the mover had cited the precedent of similar Indian councils, Mr. Wyndham gave a too hasty assent. In regretting and taking back his approval, he excuses himself merely by his "colossal ignorance of Indian affairs," the unhappy occurrence of a holiday involving a hasty action, and the undue, if wholly loyal, zeal of the Under-Secretary. Clearly, he comes off but lamely in the matter, and the Government, which, with its paper majority reduced to about eighty, needs the Nationalist vote more than ever—*it* is always present and counted—enters upon a session in which rebuffs may confidently be expected.

TWO PER CENT. A MONTH.

In his communication to the Senate accompanying the proposed treaty with San Domingo, President Roosevelt gave some account of the foreign debt of that republic, of the face value of which, he says, the Government probably did not receive over 50 or 75 per cent. Then he adds:

"Other portions of the debt were created by loans for which the Government received only one-half of the amount it was nominally to repay, and these obligations bore interest at the rate of one to two per cent. a month on their face, some of them compounded monthly. The improvidence of the Government in its financial management was due to its weakness, to its impaired credit, and to its pecuniary needs occasioned by frequent insurrections and revolutionary changes, and by its inability to collect its revenues."

This illuminating paragraph is found in the midst of a heated discourse on the Monroe Doctrine, the logic of which runs thus: Since Spanish-American and Spanish-African countries have frequent revolutions and need money to put them down—or to carry them on, as the case may be—and since European speculators take their bonds at 50 per cent. discount, charging 2 per cent. a month interest, therefore the Monroe Doctrine requires *us* to do something. Insurrections and revolutions have been going on in those countries for the better part of a century, and money has been borrowed to put them down, or to carry them on, wherever lenders could be found to take the hazards of the enterprise. In all cases heretofore the lenders have known that they took the risk of losing their money. The loan was a bet on one side or the other. Very frequently there were wagers on both sides, as in an ordinary poolroom, and the gamblers seldom thought of looking beyond the stakes for the return of their money. A revolution much like this was going on in San Domingo while President Grant was conducting the negotiations with Baez, leading up to the treaty which the Senate rejected. The poolroom in that case was here in New York.

Mr. Roosevelt proposes to change the system so that the betting fraternity shall have more security for their investments. It is proposed to advertise to the two-per-cent.-a-month men in Europe and America that if the country whose paper they shave fails to pay, they have only to invoke the shade of Monroe to bring Uncle Sam upon the scene, who will forthwith send a fleet and take charge of the defaulter's custom-houses and collect tolls for the claimants. It is needless to say that, with such assurances, there will never be any lack of poolrooms for taking chances at 2 per cent. a month on Spanish-American and Spanish-African insurrections. Indeed, there have been plenty of them before. English capital has been freely invested in such enterprises in Central America in times past, and would have been more largely placed there had not the English Government given notice that it would not guarantee any loans of its subjects to foreign governments, since to do so would enable private persons to involve the country in war. Naturally, these private persons want some other government to do for them what their own Government refuses to do. Hence, the invocation of Monroe and the appeal to Uncle Sam at the present time. And here it is pertinent to ask what harm has come to us, or to Monroeism, in the past while these poolrooms have been open? What is the reason for this sudden change of policy on our part towards the two-per-cent.-a-month bankers in foreign lands?

Some hints are thrown out, as an answer to this question, in the President's communication to the Senate. He says that a loan was made, or a claim was held, against San Domingo by the house of Westendorp of Amsterdam; that default was made by San Domingo, and that the Westendorps assigned the claim to the San Domingo Improvement Company, an American corporation. Very little information is given as to the genesis of this company, its composition, its paid capital, its charter powers, its aims, or its doings, except that it has acquired the Westendorp claim. It is probable that the Westendorps parted with it because their own Government would not take it up. It may be a valid claim, but it does not follow that the United States Government should have anything to do with it. Still, it would be interesting at this crisis of Monroeism to have a complete history of the San Domingo Improvement Company; to find out what persons own it; what they paid for it; what money they have spent for the benefit of San Domingo as an equivalent for the $4,500,000 which we are now collecting from that poverty-stricken people for their benefit; and how they came to take the bonds of the Westendorps—so that the country may know whether we are engaged in an honest and clean transaction, or whether this is one of the many fraudulent and dishonest schemes which financial adventurers of the two-per-cent.-a-month variety succeed in fastening upon countries distracted by revolution, by bribing the temporary dictator of the country to sanction their predatory game.

The San Domingo Improvement Company of New Jersey may be a noble-minded and perfectly clean-handed corporation, for which we are exacting only the money it has acually expended for the benefit of that unfortunate people; but it may be that we are only the cat's-paw of financial adventurers who are getting two or more dollars for every one that they have actually invested. What we want is light—to obtain which, time is required and is abundant. Moreover, since both the Executive and the Senate have begun by giving publicity to the treaty, the investigation should be public also.

THE SENATORIAL PRIMARY.

The usual number of State legislatures will doubtless adopt, before the winter is over, resolutions for electing United States Senators directly by the people. The national House of Representatives stands ready at any time to vote for the same reform, but, so long as the Senate itself opposes it, a Constitutional amendment is out of the question. Yet, while the agitation for a change in the organic law is practically hopeless, there has been in the last few years a remarkable movement for securing many of the same objects in an indirect way.

Hitherto, the system of nominating party candidates for Senator by a popular primary has been confined to Southern States, where the Democratic nomination was equivalent to election. Not until last year did the idea take root in the North, but it seems to be spreading now very rapidly. Wisconsin adopted by referendum last November a law under which the voter records his choice of party nominees not only for Governor and State officers, but for United States Senators as well. This was regarded as a rash step even by many advocates of the direct-nomination idea. Yet, without waiting to see the result of the experiment, a half-dozen other Northern States are thinking of adopting the same comprehensive plan. In Illinois, where Gov. Deneen made primary reform one of his campaign issues, the "administration" bill provides for the placing of names of Senatorial candidates on the primary ballot, with the proviso that "the vote upon such candidates for United States Senators shall be had for the sole purpose of ascertaining the sentiment of voters in the respective parties."

In South Dakota the primary bill, which has been the most prominent measure before this year's Legislature, likewise has been drawn to include Senatorial nominations, as has the bill before the Legislature of Washington. In Minnesota, where the direct primary system for local offices has been in existence for some years, it is now proposed to extend it to the choice of United States Senators, and this is to be urged before the Legislature. That is to say, in most of the localities where primary reform is an issue at all at present, the proposal is for the people not only to nominate all officers whom they are themselves to elect later on, but also for them to issue binding instructions as to an office which the Constitution intended should be taken out of their hands altogether.

This is very like the process by which the electoral college was stripped of its discretionary power. It has been the

American way in the past, when a fundamental change of plan has been unobtainable, to devise a workable arrangement under existing laws. The obligation of the Presidential elector to vote for his party candidate, though not enforceable in any court, is so strong that even under heaviest pressure no man has disregarded it in more than eighty years. It is more than doubtful if a State Legislature would ever give up its power so completely. As Walter Bagehot somewhere points out, a body which is chosen to perform a variety of functions can never become the mere agent of its constituency, as may the body chosen for but a single purpose.

In the Southern States, the election by primary seems to move like clockwork. Two years ago Colorado and South Carolina elected Senators at about the same time. In the one case, the two houses were in a state of siege at the capitol, and it looked as if a Senator could be elected only at the cost of bloodshed and riot. In the other, the debate on some unimportant local bill was merely suspended for a minute while a unanimous ballot was cast, and the member who had been interrupted went on with his speech. In fact, Mr. Latimer's own biography in the Congressional Directory makes no acknowledgment at all to the Legislature to which, in theory, he owed his preferment. "Was elected to the United States Senate by 17,700 majority," the Directory says, "over J. G. Evans, to succeed John L. McLaurin." In Arkansas, the number of votes cast in the Democratic primary which chose Senator Clarke was practically twice as great as the total vote for Parker last fall.

There are manifestly greater difficulties in the application of such a system to a State where more than one party exists. A few Assemblymen, for instance, whose own constituents wanted Stokes for the Senatorial nominee though Noakes was chosen, might conceivably hold the balance of power in a close Legislature, and actually strengthen themselves politically by disregarding the verdict of the primary. This condition has no parallel either in the Southern States or in the workings of the electoral college. But such difficulties can be solved only by facing them. It is hard to see how, in any event, a popular vote for Senators, whether in the primary or the election itself, could produce worse results than the system of choice by the Legislature. This State, under such a law, might now be represented by Elihu Root and Joseph Choate, instead of by Platt and Depew.

THE RAINES-LAW HOTEL DOOMED.

The favorable report by the Senate's City Committee upon the City Club's bill to do away with the abominable Raines-law hotels is a convincing sign that the Republican leaders have decided to allow this measure to become law. In our opinion, no more important legislation will be enacted at Albany this season. The proper solution of the water question is, of course, essential and pressing, but the City Club's bill strikes at an evil which has done more to lower the moral tone of New York than any other. The existence of the "fake" hotel, besides demoralizing the public, has demoralized the guardians of the peace. They have seen unmentionable crimes a matter of daily occurrence in resorts which technically have the sanction of the law, but really bring the law into contempt and contumely as does no other business—not even the corner saloon with its defiant violation of the Sunday-closing law.

What the Raines-law hotels are, the Committee of Fifteen clearly brought out in its report on the social evil. Trained investigators found that these inns have been "the scene of most insidious and therefore most effective solicitation," with rooms so conveniently arranged as to make exposure unlikely. The existence of these rooms quickly drove many saloonkeepers into renting them to dissolute persons as the only possible way of making them pay. The city has had no genuine need of the hundreds of so-called hotels which have flourished under the law, but the saloon owner had to take an entire house if he wished to sell liquor legally on Sunday. As the Committee of Fifteen reported, the "most damning charge of all" brought against this mushroom hotel is that it "provides the greatest known facilities for seduction." Young girls are brought there, regaled on liquors of the influence of which they are ignorant, and then fall easy victims. The Committee found that this terrible allegation was true, and every New Yorker who knows anything at all about city conditions knows that the language it used was if anything too mild.

That such conditions could have been tolerated for any length of time in an American city seems beyond belief, but it is characteristic of our rural rulers that, until recently, they have refused to consider any suggestions for a change. Senator Raines has repeatedly declared that his law was not only above suspicion, but beyond improvement. No denunciations of it by bench or by bar, by the press, or by the clergy have hitherto availed. You might cite the number of proved seductions from year to year since 1896, when the law was passed, but it made no more impression than a demand for relief proceeding from the most public-spirited citizens and societies in this city. The Legislature knew what was best for New York, no matter how fearful the price the city might be paying. Just what has brought about the change we do not know. Whether the credit wholly belongs to the City Club or to Senator Raines or in part to Gov. Higgins, we cannot attempt to decide, but we do say that the prospect of relief is a genuine cause for congratulation. The abolition of the Raines-law hotel will be an event as well worthy of celebration as the opening of an underground railroad. That such reforms can be achieved by persistent fighting must encourage the most pessimistic. It is plain proof that an aroused public opinion of this city can still make itself potent at Albany. And that opinion, be it noted, has never been so well organized, so sensitive, or so readily directed, as at the present day.

It is but fair to Senator Raines to say that the present bill is based upon one he prepared last year, and that he has readily accepted the changes suggested by the Anti-Saloon League and the other conferees, Messrs. W. S. Bennet and Lawrence Veiller. These gentlemen are confident that fully 90 per cent. of the iniquitous hotels will disappear at once. In brief, the bill requires the Commissioner of Excise, before issuing a license, to find out from the Superintendent of Buildings the date on which the building was made into a hotel, the height of the structure, whether it is fireproof or not, and whether it complies with the law as to its rooms, their size, number, etc. If the reply shows that the hotel does not comply with the Raines law or the building laws, the Commissioner of Excise is forbidden to grant a liquor-tax certificate. Now the law requires that all hotels fitted up or constructed since 1896, and thirty-five feet in height, shall be fireproof. It is just this provision which is expected to do away with the "fake" hotels. They cannot be made over into fireproof structures, for it would not pay their proprietors to do this, even if they had the means. So far as the hotels in existence prior to 1896 are concerned, many of them are bona-fide, some having done a legitimate business for thirty or forty years. To require them to rebuild would cause unnecessary hardships from the point of view of those who would attack only the illegitimate resorts, however desirable reconstruction might be for reasons of public safety.

It must not be forgotten that this legislation leaves the ordinary saloons untouched, being aimed merely at those with ten-room attachments. It does not in any way solve the question of Sunday opening, licit or illicit. It may, and probably will, increase the illegal Sunday profits of the saloonkeeper, whose chief competitors have been the "fake" hotels. The question whether we are to have a law regulating the Sunday sale of liquor which can be enforced, or are to go on violating the present law, is yet to be settled. The abolition of the fraudulent hotel will clear this issue of one complication which has done much to befog it.

A WAR AVERTED.

The great and happy significance of the North Sea arbitration is that it prevented a desolating war. Men may debate the balanced and somewhat inconclusive findings of the court, but no one can deny that reference of the dispute to the court was all that prevented England from going to war with Russia. "We might find ourselves at war before the week was over"—such was the startling language of Lord Lansdowne to Count Benckendorff on October 26, as contained in the correspondence now published. The English Foreign Minister also called the Russian Ambassador's attention to the "concentration of the British fleet at Gibraltar and elsewhere." The situation was critical. English public opinion was clamorous. The drift towards war was obvious; and with Russia and Great Britain plunged into hostilities, the danger that France and Germany might also become involved was acute. Hence it was an impending calamity, immense and almost unthinkable in its proportions, from which the resort to arbitration saved the world.

Note, too, that the points involved were precisely of the kind to go to war about, with each side maintaining that it was innocent and aggrieved. There was a sharp issue on a matter of fact. The Russians asserted that they were attacked by torpedo boats. To this the English indignantly replied that there were no war vessels of the kind lurking behind and among the British fishing fleet, and to assert that there were was grossly to insult England, as it implied that she had deliberately violated the obligations of a neutral. But consider how strong the Russian case would appear to Russians to be. Their admiral himself, with several leading officers, was on the bridge; they had glasses; the searchlights were turned upon the suspicious ships; and all agreed that torpedo boats were seen. If there had been war, the question would have been debated to the end of time without a conclusion. But now, without making a single woman a widow or any children orphans, we have the impartial decision of a body of competent officers, and it will command universal acceptance. Thus arbitration may challenge preeminence over war as a means of "settling things." There was also that most delicate point in an international controversy—a nation's pride and jealousy in behalf of its own officers. Lord Lansdowne demanded that, in addition to apologies and indemnity, which Russia was prompt in offering, Admiral Rozhestvensky be "punished." On that point war hung for some days. Punish our admiral? cried the Russians; first prove him culpable. We assert him guilty, hotly retorted the English. From that deadlock of opinion, with swords drawn, arbitration was the escape. It was a blessed escape, possible only because Premier Balfour was not, as Mr. Roosevelt privately assured his visiting Irishmen in 1897 that he was, "against arbitration between nations."

Some uncertainties and disappointments will linger after the decision of the Paris Commission; but so they would after a bloody war with a million killed. The main points are cleared up to the satisfaction of reasonable men. As to the torpedo boats, all the Commissioners but the Russian agree that none were present. With the Austrian, French, and American admirals uniting in this finding of fact, it must be considered as put at rest, so far as all the evidence now available goes. Yet Rozhestvensky's orders were held to be "not excessive in time of war," except for the actual opening of fire, which was "not justified"; and a general recognition of his "military valor" and "sentiments of humanity" was thrown in as a final placatory flourish. If the whole bears marks of delicate seamanship on the part of the arbitrating admirals, so as to steer clear of rocks on either side, the result is yet one to be received with thankfulness, since it comes from skilled and unbiassed men, and averts a terrible war. It is one renowned victory more for arbitration.

With general relief will it be learned that the first press rumors of the decision were unfounded in one particular. The Commission avoids going the length of asserting that an admiral's duty in war time is to fire first and find out later what he is firing at. This would have been an alarming doctrine. Neutral commerce would everywhere have felt itself exposed to appalling hazards. Readiness of a blundering admiral's home government to make reparation would have helped the situation but little. As Lord Lansdowne observed with great force to the Russian Ambassador, if a naval commander was to let go his guns on a mere theory that he was attacked, "who would be safe, and what was to prevent the Russian fleet, during its long journey to the Far East, from carrying death and destruction with it throughout its course?" From that peril, though some naval officers have said privately (Lord Charles Beresford is reported to be one of them) that it is an unavoidable incident of war as now conducted at sea, the Paris Commission does its best to free the world of commerce. It shrinks from establishing a precedent under which a rash commander might make himself with impunity a terror of the seas. There may be dispute whether the Commission should not have gone further and been more exact and explicit; but, at any rate, it did not admit that Rozhestvensky was justified in firing upon peaceful vessels without first making sure of their character. We want no *Flying Dutchmen* of that kind chartered.

The carefully framed compromises of the decision leave room for both England and Russia to grumble a little; but, in reality, each ought to be content. England's main contentions are upheld. Perhaps nobody will be "punished," as Lord Lansdowne insisted; but, under the agreement, Russia was to do whatever punishing seemed necessary in view of the Commission's assignment of guilt. That, however, is so vague that probably nothing will be done. Thus Russian *amour propre* will not be seriously impaired. But, over and above all such considerations, rises the great deliverance from war, with the vivid and salutary reminder that civilized nations have now a way of settling their quarrels not in the manner of wild beasts.

GEORGE S. BOUTWELL.

George Sewall Boutwell, who died on Monday last, was born on January 28, 1818, at Brookline, Mass. He was a descendant, through his father, of James Boutwell, who was admitted a freeman in Lynn in 1638; and through his mother, Rebecca Marshall, of John Marshall, who landed at Boston in 1634. His mother's father, Jacob Marshall, invented the cotton press, the first use of which, however, was in pressing hops. Both families were of pure English stock, and Mr. Boutwell himself was thoroughly representative of that remarkable civilization which characterized the development of the little republics of New England. When he was but two years old his father bought a farm at Lunenburg, incurring a debt of $1,000, which was paid only after twenty years of severe toil. The boy's schooling was limited. He learned to read while facing his mother as she held the Bible open in her lap, and always retained the power of reading an inverted page. He attended the district school, summer and winter, until he was ten years old, and the winter school until he was seventeen, when his school life ended. There were educational influences enough, however, at a time when the common people were shaking off the restraints of the Puritan régime, both political and religious, and the air resounded with controversy. Mr. Boutwell soon freed himself from religious trammels and had little to do thereafter with churches. When he was thirteen, he became clerk in a country store, and was thenceforth in active intercourse with men. He studied when others were sleeping, reading many good books, and fitting himself as well as he could to practise law. He taught school for a few months, but soon returned to shopkeeping—this time at Groton, which was his home from 1835 to the time of his death. This town, which is now best known because of the boys' school recently established there, was then a place of importance. Several eminent lawyers lived there, among them the father of Margaret Fuller. She was known to Mr. Boutwell as a Sunday-school teacher, in which capacity he recollected that she expressed her opinions "in a style which indicated that they were not open to debate."

The country store has always furnished an opening for talents, and Mr. Boutwell's probity and capacity in business, combined with the severe training which he gave

himself by persistent study at night, made him respected and influential. Such a man, in such a community, necessarily enters political life. Mr. Boutwell was a Democrat because he believed in equality and the other principles of the Jeffersonian school, but he never defended slavery, and he opposed the annexation of Texas. He was a demagogue in so far as he represented the middling and lower class of people in their struggles to overthrow the old aristocracy of the State; but he was sincere in his support of Democratic principles. He held "Shay's rebellion" to have been justified and even beneficial to the State; but he differed with his party concerning liquor legislation. He was several times defeated at the polls because of his independent action, but represented his town in the General Court for several of the years between 1840 and 1850. His achievements as a legislator consisted in transferring the choice of the overseers of Harvard College to the Legislature—a mischievous but short-lived measure—and in enforcing the taxation of personal property. He also served on several commissions—a field in which his business abilities were successfully employed.

By the combination of the Free-Soil and Democratic parties, Mr. Sumner was elected Senator in 1850, and Mr. Boutwell Governor in 1851. All the offices were then held by Whigs, and Mr. Boutwell promptly replaced them with Democrats and Free Soilers. He had, even in his later years, little sympathy with the civil-service reformers. After his term of office was over, he became Secretary of the Board of Education, in which capacity he visited every town in the State, holding "teachers' institutes," and making, during his five years of service, more than 300 addresses. In this way he came to know the State thoroughly, and to be known to all men active in public affairs. Meanwhile, the Republican party had come into being, and Mr. Boutwell's anti-slavery feelings naturally carried him into its ranks. He saw the nature of the crisis in 1860, and urged that an armed force should be raised to secure the inauguration of Lincoln. He advocated emancipation from the first; and indeed his career in the House of Representatives, of which he was a member from 1863 to 1869, may be described as an advocacy of all the most radical measures of the Republican party. He took a leading part in the impeachment of President Johnson, and always maintained that the votes of the House and Senate really established the principle that the Executive might be impeached for acts which were not indictable offences. He was, of course, a supporter of the policy of reconstruction which Congress finally adopted. He was a more sedate person than Thaddeus Stevens, but not less determined and violent in his policy. He proposed in 1868 to abolish the existing governments and make the whole South a military district. The Fourteenth and Fifteenth Amendments were largely his work, the latter especially. He was responsible for the Tenure-of-Office Act, which was intended to keep Mr. Stanton in control of the army. The lesson that he drew from the impeachment proceedings was that it would be unwise to lengthen the term of office of the Executive. The impossibility of removing a President made it desirable, he thought, that there should be frequent elections.

In March, 1869, President Grant appointed Mr. Boutwell Secretary of the Treasury. He was known only as a radical politician, and the financial world was not pleased with the choice. Mr. Boutwell, however, proved to be in many respects an excellent officer. After he had held office four months the *Nation* observed that "intelligible, business-like purposes, frankly announced in advance and faithfully adhered to, a consistent recognition of the law as his only and imperative guide, and an equally consistent disregard of that kind of popular clamor which is almost always due only to the selfishness of influential individuals, and which is so often pleaded as an excuse for official vacillation and tergiversation," were characteristics that went far to justify the President in making the appointment. Mr. Boutwell undoubtedly bettered the administration of the Treasury, which under President Johnson had become very corrupt. There were no more "leaks" for stockjobbers to profit by. The Secretary kept his own counsel, and made his announcements so that the whole country knew what was to be done, although he was induced to act as a *deus ex machina* in the "Black Friday" panic in 1869, ordering a sale of gold in violation of the published schedule for the purpose of affecting the market price. He applied the surplus revenue to the redemption of bonds for the sinking fund—a requirement before neglected—and in that way increased the credit of the Government. He also greatly improved the form of Treasury statements, the methods of keeping accounts, and the personnel of the service.

Unfortunately, Mr. Boutwell was narrow in his financial views, and, in fact, ignorant of financial history. His convictions were so strong as to make him arrogant and intolerant. He was incapable of appreciating the invaluable services of Mr. D. A. Wells, and probably persuaded the President that he could be dispensed with. He was a bigoted protectionist, and had no disposition to apply the principles of civil-service reform in his own Department. The collection of the customs was attended with some scandalous abuses, due, to a great extent, to the bad character of the officers of the revenue service. Towards the end of his term he attempted, at first without success, to refund a part of the public debt, and in a later attempt paid a syndicate of bankers a considerably larger commission than was authorized by law. His motive was laudable, and the transaction was probably advantageous to the Government; but it was of doubtful legality, and was pronounced improper by Congress. Finally, at a time when confidence was greatly shaken, he allowed a subordinate (a New York banker having induced President Grant to give the order) to reissue a large number of the "greenbacks" which had been paid and were supposed to be cancelled. This proceeding greatly alarmed all conservative business men, especially as Mr. Boutwell appeared to claim the right to reissue the whole $44,000,000 that had been paid off. He appeared to assume that it was the duty of the Secretary of the Treasury to supply the currency needed "to move the crops"—a view which commended itself to the desperate speculators who were threatened by the collapse which soon took place. The committees appointed by Congress to investigate the matter declared this view unwarranted by law, and severely condemned Mr. Boutwell's claim to exercise a power which might, by inflating the currency, impair the obligation of contracts to the extent of one-tenth. He soon after resigned his office, having been elected Senator, and thus escaped the evil days for the Treasury which came in President Grant's second Administration.

Mr. Boutwell's term as Senator ended in 1877, and he was not reëlected, partly on account of the hostility of Gen. B. F. Butler, who was aggrieved because Mr. Boutwell opposed the confirmation of the notorious Simmons as Collector at Boston. In 1877 he was appointed a commissioner to revise the United States statutes. He served as counsel for the Government in 1880 in the settlement of the claims of Frenchmen arising out of the civil war, and took part in numerous cases involving questions of international law. After many years of withdrawal from public affairs, Mr. Boutwell was impelled by the oppressive and sanguinary course of our Government in the Philippine Islands to raise his voice in protest. A partisan all his life, he could not bear the spectacle of the Republican party trampling on the Declaration of Independence and the Constitutional amendments securing human freedom which were bought with the great price of the civil war. His speech on "Imperialism as a Public Policy" contrasted forcibly the principles which led to the emancipation of the negroes with those which were involved in the subjugation of the Filipinos. It illustrated, too, the intensity of conviction and the rugged honesty for which Mr. Boutwell was distinguished, and which gave him for many years a position of almost unparalleled influence in the councils of the Republican party. He may be said, in spite of his advanced age, to have been the head and front of the anti-Imperial sentiment and propaganda in Boston, and his utterances were to the end remarkable for vigor and fire. This was his last service to his country; and it was, perhaps, more trying and more honorable to him than any other that he ever rendered.

EL TRIBUNAL DE AGUAS.—I.

The vagaries of Spanish justice have long been a byword. The judicial temperament, under those heating skies, is commonly reported to suffer from the want of objective aloofness, from a general tendency to read new and unexpected connotations into such familiar terms as legality and equity. During more than one visit to Spain, with somewhat more than ordinary opportunities for obtaining tolerably accurate general information, I have repeatedly been struck with the bitterness of Spanish litigants (whether successful or not) over their experiences in this connection, and with their invariable eagerness to avoid for the future by any possibility the slow ordeal of waiting for a judgment. At first, the habitual caution of generalizing with reserve leads one to listen to these complaints as one might turn an ear to pungent, amusing gossip; it is the reiteration of them that compels conviction.

By way of a specimen case, the following anecdote, vouched for in all its details by the one who suffered (and by his *abogado*),

was admitted to be typical by many others to whom it was repeated. A large dealer in exports rented a neighbor's field some two or three years ago for a single season, the crop being wanted to satisfy an unusually heavy order from a foreign house. Now it happened that the owner of the field was in debt and declined to pay. Just at the time when the crop was ready for gathering and immediate shipment from the little Mediterranean port, the grower was astounded to hear that the whole of this movable property had been attached to the soil by some legal process or other until the creditor should be satisfied. After the first wild wrangle, in which the shipper vainly protested against seizure of *his* effects, the lawyer on the other side calmly proposed the following terms "as compromise," viz., payment of *half the original debt and all the costs.* Naturally, this was rejected; and the fuming merchant with his counsel took the apparently accepted Spanish step of waiting upon the judge appointed to try the case when called, who immediately declared the seizure to be illegal, pledging himself to set it aside in due season. When the day of trial came, that dispenser of justice was away on sick leave. To save delay and the year's crop, the victim consented to compromise on half the costs; thus the lawyers were paid, but I never could hear anything of the original creditor.

Such facts as the above are readily explicable through the absence of a firm public opinion in a country where absolute illiteracy is the lot of a deplorably large number; where the usual difficulty of bringing pressure to bear on corruption or venality is increased by the vast mass of ignorant indifference precluded from hearing of abuses. How can there be a general active interest in public affairs when fully sixty-five out of every hundred can neither read nor write? This very condition, however, has for centuries produced other effects, singularly local in their character, yet testifying to the shrewd, practical wisdom of the Spaniard, if once thoroughly interested in his own affairs. *La politica regionalista* is the conventional generic phrase that covers all these forms. It is this that has established on a firm working basis a number of institutions circumscribed, it is true, in a narrow region of activity, yet capable of achieving a variety of good results without let or hindrance from central authorities. Such, for instance, are the Conservatory of Music at Malaga (supported by local private subscription), the School of Fine Arts at Palma de Mallorca, the truly admirable Archives of Catalonia and Aragon at Barcelona, besides a host of other examples which any observant traveller may easily find for himself in the intervals of visits to conventional sights, and to which the never-failing courtesy of the Spaniard will grant the stranger a prompt, even eager, admittance. Many of such institutions are of comparatively recent growth; but, deep down in the traditions and customs of that most intensely conservative of peoples, the spirit of independence has planted others, less conspicuous perhaps to the casual eye, but far more ancient, and belonging in their very essence to that strong, self-reliant habit of conduct which is involved in the manifold meanings of the term *Españolismo.* As it was my privilege some months ago to observe one of these in full working order, I take pleasure in recording my impressions, more particularly as no familiar work of Spanish travel (not even Ford) devotes a single paragraph to this example of popular wisdom and forethought.

In order to understand its nature, it must be borne in mind that the Mediterranean coast of Spain, when not cut by bold, perpendicular mountain-bluffs, consists of a flat, alluvial plain, varying considerably in width, and watered less by rain than through the numerous streams of the ranges accompanying the sea line for miles and miles of level length. The natural fertility of this coast region is phenomenal; one needs but to traverse the *huertas* of Malaga, Murcia, or Alicante to obtain a thrilling impression of simply inexhaustible wealth, which the patient hand labor of the Iberian peasant works up, season after season, into the splendor of vegetation that covers it all. As I stood on the apex of the citadel of Saguntum, rising, as it were, an isolated, impregnable pyramid out of that marvellous plain, and turned first towards Valencia, all ruddy pink and gold under the slanting rays, then northwards where the seemingly endless green stretches vanished in the powdery haze of the late afternoon, I realized for the first time the full meaning of that siege on which hung for a season the rival destinies of Carthage and Rome. To keep this region constantly supplied with water (in view of the comparatively light rainfall of that sunny clime) was a problem solved centuries ago by the ingenious industry of the Moors, who devised a system of irrigation as complete and elaborate as that which the *campesinos* of the *Vega* of Granada have allowed to fall into a state of relative neglect.

A most interesting drive may be taken to the outskirts of Valencia, or any other coast town, for the purpose of verifying the perfection of comparatively simple appliances by which the crops are kept so constantly green until the long summer has scorched the fields to a uniform brown or dusty gray. This system of local canals, with plain wooden sluices easily manipulated, distributes over the whole coast plain the abundant waters of the mountain torrents, without which the country would remain an almost barren desert. Rain water, with its fertilizing qualities, would no doubt be preferable, and several proverbs or maxims, current in the locality, testify to the value of an exceptional rainfall; but, failing this, the peasant is but too eager to avail himself of the priceless fluid distributed over the soil by a network of narrow waterways so constantly fed that the supply fails only in the rarest of dry years. To establish and pay a system of official inspectors for this system, under the control of a "central irrigation office," would involve the creation of a special bureaucracy with all the familiar weaknesses of such Spanish *juntas*, of which the peasants have, naturally enough, an uncomfortable suspicion, preferring to keep the whole management in their own hands and to settle all cases of dispute according to the fashion bequeathed by traditional practice from their ancestors in the days of presumably indifferent Moorish rule. There has thus developed, in this locality, an absolutely unique court of arbitration, which testifies in its workings to the practical and expeditious common sense of the men whose nerves and muscles make a garden of the Valencian province. I am informed by a friend learned in the law that to the existence of this court there is but one reference in English legal works. Cases calling for such intervention arise, of course, from the fact that a farmer is charged with having opened the sluices for a longer time than he is entitled to; but I was also given to understand that in a quiet way much private litigation is warded off through the influence of the wise men whose ostensible duty is with water disputes alone. As the Athenian stranger says in the 'Laws' of Plato: "There might be an excellent judge who, finding the family distracted, not only did not destroy any one, but reconciled them to one another ever after, and gave them laws which they mutually observed, and was able to keep them friends." P. T. L.

ELVIRA'S LETTERS TO LAMARTINE.

PARIS, February 8, 1905.

Criticism and inspiration are almost incompatible terms. There is, at the present time, in our critical school a tendency to look for the sources of inspiration in the incidents of every-day life. The private life of the great writers is scrutinized with the utmost care, and their works are explained by their acts. No writer can help, of course, finding elements in his surroundings; but our critics do not perhaps, keep enough in mind the creative power of imagination. Chateaubriand, Balzac, Sainte-Beuve, Victor Hugo, Lamartine, all are in turn subjected to a process of criticism which seems to have for its object to bring them down to the common level of humanity.

I shall speak to-day only of Lamartine, who was and is still the idol of all who remain faithful to the most ideal poetry. When his "Meditations" appeared, they were an event, as much as would be the apparition in the sky of a new and brilliant planet. Their inspiration was different from that of the preceding age, from the eighteenth century to the end of the Revolutionary and Imperial period. It was so different that the first publisher who read the manuscript returned it with these words: "It is not in the style of the age." Lamartine published the first "Meditations" at his own expense, I believe; only fifteen hundred copies were printed, and most of them were distributed by him to his friends before he started for Rome as secretary of embassy. An article in the *Journal des Débats* drew the attention of the public to the young poet; the success of the "Meditations" was instantaneous, and several editions had to be printed in rapid succession. The "New Meditations," printed a short time afterwards, continued the success of the first. There was in these two volumes a new note—a profound, a religious feeling; a love of nature which was not the admiration of a pagan, but the gratitude of man to the Creator, a feeling for the sublime in the creation; an expression of love which was not profane and sensual, but had a purity and an elevation altogether unknown in the preceding age.

Lamartine says in his 'Raphaël': "One always finds whole in a man the first woman whom he loved." Who was, for him, this first woman? Who was the inspirer of the first "Meditations"? Who was the per-

son whom he calls Elvire, this sister of Beatrice and of Laura? The secret was long suspected by the personal friends of Lamartine; it has recently been revealed by M. Charles de Monterot, a grand-nephew of Lamartine, now living at Saint-Point, who has authorized the publication of the letters written to his great-uncle by the mysterious Elvire—those, at least, which the poet did not destroy, and which were religiously kept in his room at Saint-Point. The real name of Elvire was Julie Françoise Bouchaud des Hérettes. She was born in 1782, of French parentage, in San Domingo. In 1791 her parents fled from the island. Madame des Hérettes died at sea; her husband arrived in France with two daughters, and lived for some time in Brittany. Julie was placed in a school, and, when her education came to an end, lived with her father at La Grange, near Tours. Julie was twenty-five years old when she was married to M. Charles, who was fifty-seven years old. He was a scientific man, who acquired some celebrity in his time by the bold balloon ascent which he made in 1783 with Pilâtre de Rozier (it was the second of the kind, next after Montgolfier's). M. Charles became much enamoured of Julie, who was very unhappy with her ill-tempered father; marriage was for her a deliverance. Charles was an excellent man, absolutely devoted to his wife, who had very delicate health. He made her acquainted with many distinguished people, chiefly with members of the Institute. At the time of the Restoration, Madame Charles had a salon, where she received Suard, Lally-Tollendal, Bonald, Lainé, and many others.

For the sake of her health, Madame Charles passed a season at Aix, in July, 1816; and it was there that she met Alphonse de Lamartine. He was twenty-four years old, and had been educated in his province, in a serious and religious family; he had no occupation, and spent his leisure hours in writing verse. He was at the time an unsuccessful applicant for a post in diplomacy. He wrote of his sensations at this period:

"I don't know what vague and sublime and infinite ideas cross my mind, every moment, at night especially, when I am, as at present, confined to my room, and hear no other noises than the rain and the wind. Yes, I believe, if, for my misfortune, I should meet one of those faces which I once dreamed of, I would love her as much as our hearts can love, as much as man ever loved on earth."

This was written in 1814 to a friend, Aymon de Virieu. Two years afterwards he met Madame Charles; they saw much of each other, and both fell in love. To this romantic attachment we owe some of the finest verses which French literature can boast.

When autumn came, Lamartine returned to Milly, and afterwards to Mâcon, while Julie returned to Paris. Lamartine had not the means of living in Paris and keeping there an apartment of his own; his friend Virieu offered him a room in his own apartments in the Rue Neuve Saint-Augustin. As soon as he was in the capital, he again saw Madame Charles. The first visit he paid her took place on Christmas Day. She received him in the midst of numerous visitors, but in the evening, when everybody was gone, she wrote to him a long letter which he received the next morning. "I ask myself if it was not a celestial apparition which God sent me, if I shall see it again, if I shall see my beloved child, the angel I adore." At the end of the ardent letter, she explained that she would see him the next day, and where she would see him. We have also the exact text of two long letters which Lamartine received from her on the 1st and 2d of January.

Love letters cannot be analyzed; we always read them, when they are addressed to others, in a critical spirit. Madame Charles's letters are very serious, and not in the tone of ordinary love letters. She touches political questions, while admitting that women have to receive advice rather than give it.

"On their part there must be submission and deference, and I assure you that I am wholly conscious of my duty. I like to recognize your superiority and I am proud of it. . . . I shall make it my happiness and my duty, dear Alphonse, to take your advice and to follow it unrestrictedly. . . . What a good woman I should be with you! What an ordinary woman I am for others. Such is love! What virtues it inspires when its object is worthy of it! I feel that my Alphonse would raise me even to sublimity."

She speaks to him of his verses: "I have read them, or rather devoured them." She has not recognized herself in Elvire:

"Oh," she says, "who will give you back Elvire? Who was loved like her? Who deserves it so much? I see her as you have painted her. This angelic woman inspires me with a religious fright. I see her as you have painted her, and I ask myself, What am I, to pretend to the place which she occupied in your heart? Alphonse, you must keep it for her and look on me always as your mother. You gave me that name when I believed that I was worthy of a most tender one. But since I see all that Elvire was to you, I see also that it was not without reflection that you felt that you could only be my child. I even begin to think that you ought to be that only."

She tells him that she will be content with his filial affection:

"Dear Alphonse, I will try to be satisfied with that. The warmth of my soul and of my feelings would like to add another passion to it, and oh that I might be allowed to love you *d'amour et de tous les amours*. But if I must conceal it from you, my angel, if you are really so much in heaven that you repel all earthly passion, I will be silent, Alphonse. . . . I will ask God for strength, and will suffer myself to love you in silence."

There is a sort of confusion in these letters between Elvire, the imaginary creature to whom Lamartine addressed his first verse, and the real Elvire, Madame Charles. Curiously enough, the real Elvire was jealous of the other. Lamartine wrote a commentary on the poem entitled "À Elvire" in the last edition of his works.

"These," he says, "were love-letters written in memory of a young Neapolitan girl of whose death I have told in my 'Confidences.' Her name was Graziella. The verses constituted part of a publication, in two volumes, of my early youth, which I burned in 1820. My friends kept some of them and gave them back to me when I wrote my 'Meditations.' I detached these examples, and wrote the name of Elvire in place of the name of Graziella."

These are the verses about which Julie Charles wrote in January, 1817. There was no confusion in her mind. She loved Lamartine; she questioned M. de Virieu, his friend, on the subject of Graziella, and was amazed at his coolness in regard to it. She had almost a quarrel with Lamartine, finding him also too cool, and complained to him of the selfishness of mankind. She had been formed in the school of Rousseau, and was very sentimental.

Lamartine composed his most famous poem, "Le Lac," in September, 1819. Julie was in a very poor state of health; she was at that moment at Viroflay, near Versailles. She wrote him a letter on the 10th of November, ending thus: "Adieu, my friend. I love you always like a good and tender mother." She died on the 18th of December following. M. de Virieu was with her, and took from her deathbed her crucifix, which he gave to Lamartine. When Lamartine was married, he gave to his first child, a girl, the name of Julie.

Correspondence.

THE YALE LIBRARY OF 1743.

To the Editor of The Nation:

Sir: I have at hand a copy of the first catalogue of the Yale College Library, prepared by President Clap, and printed in New London, in 1743. This catalogue is not arranged alphabetically, but is partially conformed to the principles of classification laid down in Samuel Johnson's 'Introduction to the Study of Philosophy, exhibiting a General View of all the Arts and Sciences, for the Use of Pupils'—a treatise which Clap incorporated in the same volume with his list of books. In his "Advertisement to the Students of Yale College," prefixed to the catalogue, the President advises his pupils "to pursue a regular course of academical studies in some measure according to this catalogue. And in the first year to study principally the tongues, arithmetic, and algebra; the second, logic, rhetoric, and geometry; the third, mathematics and natural philosophy, and the fourth, ethics and divinity. Other less principal studies may be occasionally intermix't with these." Those who are familiar with the history of the Yale curriculum will notice that, on certain important lines, its character and arrangement were early determined and have been faithfully adhered to.

In contrast with the 400,000 volumes in the modern library, the Yale collection of 1743 contained only about 2,600 volumes, of which a considerable number had come through the recent liberal gift of Bishop Berkeley. But an examination of the titles shows that, with a few exceptions, the college possessed a fairly comprehensive assortment of books. The first section, under the heading "Languages, English," contains only two titles, "The English Grammar" and "Dr. Watts on Reading and Writing English"—no doubt an inadequate apparatus according to modern notions of how English should be studied. In those days, however, educated men got their English through the classics, and in Greek and Latin the Yale Library was relatively strong. The departments of history, natural philosophy, medicine, Biblical literature and theology are all well represented. The last division of the catalogue, "Plays and Books of Diversion," includes thirteen titles, viz., Addison's "Cato," Ben Jonson, Fontenelle's Dialogues, Gray's Fables, 'The Dunciad,' Shakspere, Steele, 'Don Quixote,'

Wycherley, Rowe's Tragedies, Otway's Plays, Spenser, and "The Turkish Spy."

JOHN WINTHROP PLATNER.

ANDOVER, MASS., February 24, 1905.

Notes.

Dodd, Mead & Co. will pursue their reprints of Trollope with a series to be called "Manor House Novels," beginning with 'Orley Farm.' A log-book for automobiles is also to be published by this firm.

The Germans have decided that they, too, must have a 'Who's Who.' A Leipzig firm is publishing it under the title of 'Wer ist es?' It includes at least 1,500 contemporary celebrities.

'How to Write: A Handbook Based on the English Bible,' by Charles Sears Baldwin of Yale, is in the press of Macmillan.

The London Folklore Society (for collecting and printing relics of popular antiquities) has just put out the latest instalment of its valuable publications (David Nutt). 'The Folklore of the Musquakie Indians,' the volume for 1902, describes a people who have been worsted in the struggle with civilization and are now, so to speak, on the point of death, and rescues for the student beliefs and traditions that would otherwise be lost for ever. The author, Miss Owen, is a native of Missouri, and is intimately acquainted with her Indians. She deals in turn with their mythical origin and early history, their government and religion, their dances—perhaps their most characteristic institution—and the ceremonial of their births, marriages, and deaths. Her style is attractive and sympathetic; she has a keen eye for the human interest, the comedy, and the pathos of her subject, and her story will appeal as well to the general reader as to the folklorist and ethnologist. The catalogue with which the book ends relates to a unique collection of Musquakie bead-work and religious implements, which with rare generosity Miss Owen has presented to the Society, and which is now on view in the Museum of Archæology at Cambridge.

'The Folklore of Northumberland,' the volume for 1903, is the newest issue in the County Folklore Series. It is made up of notes, collected by Mrs. M. C. Balfour and Mr. Northcote Thomas, on the superstitious beliefs and practices, the traditional customs, the traditional narratives, and the folk-sayings of the district. We note that some typical features of border folklore—the slogans and warcries, the nicknames, proverbs, and legends—are but slightly represented in its pages. This is due to the fact that a great deal of space has been devoted to them in previous publications of the Society, in Henderson's 'Northern Counties' (1879) and in the two volumes of the Denham Tracts (1891 and 1895). The sections on the life of the people, their games, their weddings, their harvest homes, etc., and on their traditional songs and ballads, refer more seldom to these works, and are perhaps the most profitable reading. The original version of "A Pennywite of Pins," known only at Alnwick, is printed here for the first time.

'La Marraine de Peau d'Âne,' by G. Franay (Paris: Armand Colin), is a recent number of the "Bibliothèque de Romans pour les jeunes filles," and is intended for girls of fourteen or fifteen, a difficult age for which to provide fiction. The tale is an echo of the famous *conte* of Perrault, and describes the adventures of a modern Cinderella who manages to lead a double life, spending her days as a nurse-maid and her evenings in bewitching the inevitable Prince Charming by her ravishing toilettes, the relics of former prosperity. Nothing could be less realistic; the narrative has all the atmosphere of a fairy-tale with a background of modern Swiss resorts and English tourists. It is written in a light, pleasing style, and can be recommended for the perusal of any young person in whom it is desired to nourish romance.

Commissioner Swan's seventeenth report on the custody and condition of the Massachusetts Public Records abounds, as usual, in sound and searching comment on existing—generally, thanks to his long insistence, improving—conditions. His chapter on the intrusion of politics into this sphere of government is bold and faithful. Two practical details are worth citing: "[My] tests prove that an ink that is proper for use upon records should have a tendency to 'bite' into the pen as it should to 'bite' into the paper." "Canvas bindings have from time to time been advised as preferable to leather because of their resistance to heat in a safe. Inspection of the ruins of the Springfield city hall showed their superiority as well in resisting flame."

The annual report of the Library of Congress possesses more than ordinary interest. Mr. Putnam's general survey is accompanied by the report of the Register of Copyright, by a list of manuscript and map accessions, and by a sketch of the publication of historical material by the United States Government—this last from the pen of Mr. Worthington Ford. From the head of the manuscripts department we have also some account of the exceptional character of the papers acquired during the year—Van Buren, Polk, Andrew Johnson, Duff Green, Clayton, Thornton, Kent, and Washburne. President Johnson's collection is both extensive and of great value for the student of his turbulent administration; in particular it is rich in official reports on the condition of the South during reconstruction. The manuscripts, of which the Southern portion is especially welcome, require already twenty steel safes, and Mr. Ford anticipates the early need of doubling this insurance. The changes in the personnel of the Library show it to be a swarming-hive of training, and point to the general diffusion of its methods and aims by the going out of so many apostles all over the country.

The arrangement of Robert Morrill McCurdy's bibliography of articles relating to holidays (The Boston Book Co.) is not easily accounted for, being neither alphabetical nor logical; nor is it rectified by an index. So much said, the list may be pronounced useful.

Of quite another order is the John Crerar Library's 'List of Cyclopedias and Dictionaries, with a List of Directories' (Chicago). Under each heading, the chronology of publication is reversed—that is, the newest works stand first, tapering off to the oldest. English works sometimes precede foreign. Bibliographical details are very liberal, and include the names of publishers. There is an index. The collection represents only this Library's possessions.

Mr. Charles Henry Hart, in the *Pennsylvania Magazine of History and Biography* for January, makes a text of Pine and Savage's painting of "The Congress Voting Independence," now owned by him. This canvas antedates Trumbull's more artistic treatment of the same theme, and has a value for its portraiture and for its correct record of the architecture of the room. It was painted, in fact, in Independence Hall. A photographic copy of it is the magazine's frontispiece. Some good Franklin-iana may be found in "Excerpts from the Papers of Dr. Benjamin Rush." The sage told how "the judges in Mexico, being ordered to prosecute a man for peculation, found him innocent, for which, they said, 'they were sorry both for his own and their sakes.' "

Dr. Erman's plan for a printed card catalogue of the books in the larger German libraries, which we mentioned some time ago, has been further discussed in the later numbers of the *Zentralblatt für Bibliothekswesen*. In the December number E. Kuhnert and A. Wolfstieg criticised the whole scheme adversely, finding it extravagant and impossible of execution. In the January number, the editor of the *Zentralblatt*, Dr. Schwenke, takes a more favorable view. He regards the suggestion on the whole as one of the most important propositions ever made on the subject of co-operative cataloguing, though he finds the part relating to a uniform classification rather weak. He points out the clumsiness of the present procedure of sending the manuscript entries which have been prepared in Berlin on the circuit from library to library, and suggests that the entries be printed at once and printed copies sent to each of the coöperating libraries for comparison and addition. This, as Milkau pointed out in his 'Centralkataloge und Titeldrucke' (1897), has, of course, the disadvantage that many titles will be duplicated by several libraries. If it comes down to a choice of evils, the question will have to be decided as to which is the greater, a certain amount of duplication or the waste of time incident to the present plan.

From the same number we learn that the Prussian Kultusministerium has appointed a commission to formulate a plan for the elaboration of a bibliographical catalogue of all existing incunabula. Professor Haebler of Dresden is chairman; the other members being Dr. Vouillième in Berlin and K. Burger of Leipzig, all well-known authorities in this field. Some years ago the suggestion was made that the inauguration of such a plan would be a fitting way to celebrate the five-hundredth anniversary of the birth of Gutenberg. Mr. John Thomson of the Free Library of Philadelphia took up the idea with great enthusiasm, and began to collect material for a catalogue of incunabula in American libraries. Nothing came of the plan at the time, however, though Mr. Thomson succeeded in collecting valuable information in regard to the most important collections of incunabula in public libraries in this country, including those in the Lenox and Newberry libraries, and, of course, in the Free Library of Philadelphia. It is interesting to learn that he is now engaged in editing the list for the Bibliographical Society of America. The great significance of this lies in the fact that

the new society will thus from the beginning take part in an international movement while contributing an important piece of work in the field of American library literature.

International features are pushing to the front in matters bibliographical and bibliothecal. The chief note of the St. Louis conference of the American Library Association was decidedly international, and an important step was taken towards the realization of the hope expressed vaguely by President Francis in his address of greeting, that, as the Philadelphia conference of 1876 engendered the American Library Association, the St. Louis conference might lead to the formation of an International Library Association. A more distinct form was given to this idea through Dr. Biagi's proposition that an International Federation of Library and Bibliographical Associations be formed. The matter is now in the hands of a strong committee, consisting of Messrs. Herbert Putnam, William Coolidge Lane, and Cyrus Adler.

Some time ago the *Evening Post* printed communications, chiefly from Professor Gayley of the University of California, regarding the publication of a collection of facsimile reproductions of the most important manuscripts in European libraries. The recent disaster to the Turin University Library has led the Belgian Minister of the Interior and of Public Instruction to call a congress to discuss this very subject, in connection with next summer's International Exposition in Liège. A commission has been appointed to make the necessary arrangement, with Prof. G. Kurth of the University of Liège as president, and P. J. van den Gheyn, curator of the manuscripts section of the Royal Library at Brussels, as secretary. The commission has already held several meetings, the proceedings of which are printed in the *Revue des Bibliothèques et Archives de Belgique.*

In the January issue of the *Quarterly Statement* of the Palestine Exploration Fund, Mr. Macalister presents his tenth quarterly report on the excavations at Gezer. There is little that is new. A fragment of a wall which, in his last report, he "thought might be identified with the foundations of the Crusaders' Castle of Mont Gisart," turns out, on further excavation, to be a gateway of a much earlier date, "no doubt the main entrance to the city in the Maccabæan period." Recent work has confirmed "the observation already made that there are" in Gezer "eight strata of building," the accumulated débris of which is 28 feet in depth. Below this there are still twelve feet of débris above the solid rock, representing an occupation of the site by a more primitive population, and in the rock itself are caves. Mr. Macalister formerly assigned these troglodytic remains to a period about 3000 B. C., and the commencement of the Semitic occupation approximately to 2000 B. C. We pointed out in these columns at the time (No. 2040, p. 99) that his evidence seemed in fact to favor a date about 3000 rather than one about 2000 B. C. for the commencement of the Semitic occupation. Mr. Macalister now finds himself forced to adopt this date, and assigns "the beginning of life on the mound to 4000 B. C."

In volume xvi., No. 63, of the *Jewish Quarterly Review*, Dr. Schechter published a Hebrew fragment, consisting in all of seven sheets, or fourteen pages, with two columns of eighteen or nineteen lines on each page, discovered, like the Hebrew text of Ecclesiasticus, in the Genîzeh of old Cairo in Egypt. From the system of punctuation and other peculiarities it was clear that this manuscript was Oriental in origin, and written not later than the twelfth century A. D. The original work Dr. Schechter assigned, on the ground of internal evidence, to a date not earlier than the tenth century of the Christian era. Dr. Lazare Belléli discusses the same fragment in a little pamphlet entitled 'Un Nouvel Apocryphe' (London: Luzac & Co.), in which he endeavors to show that it belongs in fact to a work of the same character as Job, Proverbs, Ecclesiastes, Ecclesiasticus, Wisdom, and Pirke Aboth, the so-called Wisdom Literature, and that it was composed some time between the destruction of Jerusalem by Titus and the revolt under Bar-Kochba, roughly 70-135 A. D. So far from a doctrine of five senses, which Schechter thought he found, and which he regarded as evidence of acquaintance with Greek philosophy through the medium of Arabic, Belléli points out that the writer really speaks of six "doors," a genuinely Hebrew conception (compare, for instance, Psalm 115), viz., mouth, eyes, ears, nose, hands, and feet. The linguistic peculiarities of this fragment seem to Dr. Belléli to indicate a period when Hebrew was still a living tongue, which he thinks to have been the case in the first post-Christian century. The original work belonged, in his judgment, next after the Book of Wisdom, to which it is, on the whole, superior. While Belléli's arguments are ingenious and sometimes plausible, doubtless the verdict of Jewish scholars will be that Schechter was correct in his general results, and that this is no new apocrypha, but a fragment of a mediæval philosophical treatise otherwise unknown.

The birthday of Charles Dickens was celebrated in London, on February 7, by a dinner of the Boz Club, at which the chairman, Lord James of Hereford, dwelt upon the novelist's influence as a social reformer. The Poor Laws, for instance, were administered now with far greater clemency than when 'Oliver Twist' was written. Lord Chancellor Halsbury, while extolling Dickens as a writer, doubted whether his fame was increased by putting him forward either as a politician or as a social reformer. Mr. Choate said that "the man who could make the whole world indulge in honest laughter was one of the great benefactors of the world." But his main theme was the popularity of Dickens's stories in America, illustrating his point by relating an incident which happened in New York at the time of the publication of 'Dombey and Son' (1846-48). The last number received here had left it doubtful whether Paul would live. "When the next steamer arrived at the docks, the passengers saw with considerable alarm a great crowd of people on the quays. Their fears were dispelled, however, when they discovered that what the crowd wanted was to know whether Paul Dombey died or no."

Our readers are aware of Professor Waldstein's hope, under international auspices, to undertake the excavation of Herculaneum. The Italian Cultus Ministry has, however, published an official declaration to the following effect: (1) that Professor Waldstein some time ago had conferred with Minister Orlando in reference to this project, but that enormous difficulties at once presented themselves; (2) that the Italian Government had since heard nothing further of the matter, and had never seen any concrete proposal regarding it; (3) that Italy is very grateful for the enthusiasm of foreign savants touching the archæological treasures it possesses, but that, for good and solid reasons, especially of a national kind, it could never consent to permit an international body to conduct or to manage any archæological researches in the kingdom. The Scientific Supplement of the Munich *Allgemeine Zeitung*, No. 10, reports from Rome that the International Congress of Artists in session in that city had declared that the excavation of Herculaneum should be undertaken by the Italian Government, and carried out by Italian scholars.

In the recent Italian elections no fewer than thirty-nine university men were elected to the Parliament; namely, eighteen ordinary and four extraordinary professors and seventeen privat-docents; or, according to another arrangement, twenty-two jurists, ten medical men, five from the philosophical faculties, and two representing political economy. The University of Naples heads the list, with fourteen representatives; followed by Rome with eleven. Padua has two, Bologna two, Parma two, Ferrara one, Messina one, Modena two, Catania one, and Pavia one. Politically, these academic parliamentarians are distributed as follows: Twenty-two are Constitutionalists, nine Radicals, five Social Democrats, and three Republicans.

The International Congress of Archæologists in Athens will be opened on April 7 by the Crown Prince on the Acropolis. On the following day the sessions begin, and will extend over eight days. The work is to be divided into seven sections, viz.: (1) Classical Archæology; (2) Prehistoric Antiquities and Oriental Peoples; (3) Excavations, Museums, and Conservation of Old Monuments; (4) Epigraphic Archæology and Numismatics; (5) Christian Archæology and that of the Middle Ages in general; (6) Archæological Teaching; (7) Geography and Topography in their relation to Archæology. In connection with the congress, excursions are being arranged for to the Peloponnesus, Crete, Smyrna, Samothrace, and Asia Minor, to examine the ruins of Ephesus, Pergamon, and Melos.

—If the public was at first slow to attach adequate importance to Mr. Luther D. Burbank's experiments in artificially stimulated plant variation, it is certainly making up for that neglect at the present time. The March *Century* adds the first of two papers to the rapidly swelling magazine literature on the subject. Mr. Burbank's results seem hardly more surprising than the volume and rapidity of experiment by which they have been secured. One brain, with but little money at its command, has accomplished what might well seem an adequate achievement for a well organized and supported bureau in the Department of Agriculture during an entire generation. Indeed, it is greatly to the discredit of the American way of doing things that Mr. Burbank has not long ago been placed at the head of such a bureau,

with a perfectly free hand and ample means and men at his disposal for carrying on his work to the utmost possible advantage. But perhaps it would have been hard to find the money without cutting into the annual garden-seed distribution. It is highly creditable to the management of the Carnegie Institution that it has voted Mr. Burbank a subvention of $10,000 a year for ten years, in spite of his entire lack of scholastic pretensions. Eastern problems are, in this number of the magazine, treated by Richard Barry, "the only American correspondent with the Japanese forces before Port Arthur from the beginning of the investment," and David Bell MacGowan, who has secured personal interviews for the *Century* with Tolstoy, Witte, and various other Russians of international prominence. Mr. Barry deals especially with the effective siege operations, the success of which he attributes to the Japanese readiness to adapt any idea whatever, old or new, to the situation of the moment. Mr. MacGowan writes of the outlook for reform in Russia, but suffers seriously from the rapidly shifting situation, which inevitably puts a magazine article out of date before it can cross the gap between the pen and the reader. Harrison S. Morris, the Managing Director of the Pennsylvania Academy, writes of Philadelphia's contribution to American art, from the time when Benjamin West "came into Penn's good old village of tree-bordered streets and undeviating angles and founded American art," down to Violet Oakley, Jessie Wilcox Smith, and Elizabeth Shippen Green.

—Miss Florence Trail has compiled 'A History of Italian Literature' (New York: Dyrsen & Pfeiffer), which evinces on her part a laudable interest in the subject. She tells us in her preface: "The toil involved in judicious selection may be understood when I say that, out of 37 poets who preceded Dante, I selected 7; out of the 100 Latin poets of the age of Leo X., I chose 1; out of 660 sonneteers, 6; out of 5,000 comedies, 9; out of the 70 poets between 1850 and 1885, 3; etcetera." Certainly, old Father Time himself cannot at this rate compare with Miss Trail as a winnower. Only 9 comedies out of 5,000! But nobody need complain nowadays of a too strict sifting of literary celebrities. Miss Trail's method is to give a brief, almost gossipy account of the life of each author; then to mention his works; and finally to criticise them, the criticism being either original or selected. Miss Trail's first guide was Cesare Cantù, but she has evidently consulted many more recent and perhaps safer critics, and has diligently delved in biographical dictionaries and literary manuals. Her enthusiasm is contagious. She moves about among the masters of Italian literature with naïve confidence in her power to appraise them. Her most serious work is the epitome of the 'Divine Comedy.' Her reflections, however, though original, are not always important: For instance: "It is evident," she says, "that Petrarch cannot be understood from hearsay. One must drink deep of the Pierian spring he has unlocked, and then it will be impossible not to rejoice in the niche he occupies in the Temple of Fame." A person who wished to get a general idea of the development of Italian literature, with personal information about its creators, and would not be disturbed by the amateurishness into which Miss Trail occasionally lapses—witness the passage just quoted—might find what he needed in her book. She dedicates it "to the Few who still love literature," and yet, according to a circular which accompanies it, we are assured that "Professor Uhler, Provost of the Peabody Institute of Baltimore, says the demand for this book will run to a hundred thousand when it is properly placed before the public."

—The character and career of Montalembert are well calculated to awaken the enthusiasm of Roman Catholics on this side of the Atlantic. In Canada, Sir Wilfrid Laurier has often declared himself a liberal Catholic, following in the footsteps of Montalembert and Lacordaire; and among the Catholics of the United States we imagine that there are more who sympathize with Montalembert than with Joseph de Maistre. Whether or not our conjecture be correct, a fresh sign of interest in the works of this famous orator, historian, and academician is now observable. We refer to the translation which Mr. Francis D. Hoyt has made of Montalembert's 'St. Elizabeth of Hungary' (Longmans). This biography, when originally published, was designed to be a vindication of the Ages of Faith against the ages of unbelief. Montalembert, in his famous speech on religious liberty delivered in 1844, exclaimed: "Nous sommes les fils des Croisés, et nous ne reculerons jamais devant les fils de Voltaire." Couched in less militant form, the 'Life of St. Elizabeth,' which was written in 1836, has something of the same spirit. The introduction, as a piece of rhetoric, is extremely beautiful. The author, finding himself in Marburg on St. Elizabeth's feast-day, is impressed by the lack of reverence for her memory which is displayed in this city of Lutheranism, where exactly six centuries earlier the Duchess of Thuringia had died. And so he resolved to write once more of the woman who there at Marburg "consecrated the last days of her life to works of heroic charity." Edification, then, furnishes the main motive of the book, but at the same time it is not unmarked by a certain controversial purpose. From the translator's preface it may be inferred that Mr. Hoyt has been moved by similar sentiments in placing the book thus directly before Americans. "To the Catholic mind," he says, "it is indeed 'strange and incomprehensible' that in this 'enlightened age' educated people, who pride themselves upon their knowledge and their liberal views on all subjects, should be in such profound ignorance of the faith and spirit of Catholics." But there are those who contend that St. Elizabeth does not belong to the Romanists alone, and a striking comment on Mr. Hoyt's preface will be found in Charles Kingsley's preface to his "Saint's Tragedy." Over against Montalembert's panegyric on the Ages of Faith may be set, if only for contrast, these words from Kingsley's prose preface to his own drama in praise of St. Elizabeth: "For the more coarse and homely passages with which the drama is interspersed, I must make the same apology: I put them there because they were there—because the Middle Age was, in the gross, a coarse, barbarous, and profligate age—because it was necessary, in order to bring out fairly the beauty of the central character, to show 'the crooked and perverse generation' in which she was 'a child of God, without rebuke.'"

—The history of religious freedom in Brazil was succinctly told in a chapter (pendent to one on the history of Catholicism) requested of Mr. J. C. Rodrigues for the Brazilian Centennial volume of 1900, and hurriedly put together. It has been separately reprinted by a Scottish press in a very attractive and handy form, and issued from the office of the Rio *Jornal do Commercio* (of which Mr. Rodrigues is the editor), under the title 'Religiões Acatholicas no Brazil, 1500-1900.' One misses very much a table of contents and an index, a chronological table, and varied running-titles. For the rest, the author has compressed within less than 300 pages a great deal of Portuguese and Brazilian history, setting forth at some length the terrible condition of the mother country under Jesuit rule and the self-imposed yoke of the Inquisition, which lasted in Portugal till 1820, in Brazil till 1810. It was reserved for the Republic in 1890 to fix in its charter the separation of Church and State, setting an example to all the other South American republics. Mr. Rodrigues, while not concealing his own liberal views, supplies with fairness and with a minimum of comment on opposing opinion the sentiments pro and con that emerged in the legislative and constitutional debates from the era of independence to the downfall of the monarchy and the present republican régime. He finally considers in detail the fortunes of the various non-Catholic denominations, devoting fifty pages to Positivism, and so reaching a veritable climax of interest, whether we consider the schism which led to the bold denial of the leadership of Laffitte, Comte's successor, or the disproportionate part which the little Brazilian group played in liberalizing the Constitution and furnishing a Positivist motto, "Order and Progress," to the flag of the Republic. In this extraordinary narrative Mr. Rodrigues's sympathy is obviously enlisted most warmly, and one remarks in it his loving portrait, by the way, of Benjamin Constant. The faithful, it appears, do not grow in numbers. Those who contribute to the Positivist sustentation fund increased from five in 1876 to 220 in 1892, and have since then fallen below 200.

—In a recent number of the *Astronomische Nachrichten*, Professor Turner of Oxford has an appreciative article on the late Frank McClean, F.R.S., LL.D., in whose death English astronomy has suffered a severe loss. His invention of the spectroscopic eyepiece, introduced by Mr. John Browning to the Royal Society, first made his name generally known more than thirty years ago; and ever since then successive operations by his own hands have firmly established his reputation. He presented to the Royal Society in 1889 his fine photographs of the red end of the spectrum, comprising just half the visible spectrum, and beside them were shown subsidiary photographs of the green to violet, so that comparisons of value were rendered exceptionally easy. All McClean's work exhibited similar thoroughness, and his great industry permitted a surprising amount of achievement. Parallel photographs of the spectra of the sun, iron, and iridium; comparative pictures of high and low sun spectra, and of sun and metallic spectra, were exhibited, all on a large scale,

By means of a heliostat mounted on the roof of his own house at Tunbridge Wells, sunlight was reflected into his photographic telescope, an instrument stopped down to four inches aperture, of 98 inches focal length, and fixed parallel to the polar axis. Until 1890 a large Rutherfurd grating was used; after that a Rowland plane grating. Certain of his metallic spectra are of rare metals difficult to obtain. In 1895, with a Sir Howard Grubb telescope (of the pattern adopted for the Astrographic Chart, but with an objective prism, angle 20 degrees, added), he began a systematic survey of the spectra of stars brighter than three and one-half magnitude, in the northern heavens. This completed within a year, he carried the prism to the Cape of Good Hope, in 1897, mounting it on a telescope like his own, and there extended his survey to the whole sky—a noteworthy feat for one man, single-handed, and for which he deservedly received the gold medal of the Royal Astronomical Society, in 1899. In addition to mechanical and scientific work, Dr. McClean made generous gifts to astronomy, among them the foundation (£12,500) at Cambridge of three "Isaac Newton studentships," for research in astronomy and physical optics; and he presented telescopes to the Cape Observatory. At his death, last November, he left bequests to many universities and scientific societies.

THE HOUSE OF BARBÈRA.

Annali Bibliografici e Catalogo Ragionato delle Edizioni di Barbèra, etc. 1854-1880. Florence: G. Barbèra. 1904. 4to, pp. 597.

Two years ago we had occasion to review Viscount Goschen's Life of his grandfather, Georg Joachim Göschen (1753-1828), publisher to Klopstock, Wieland, Schiller, and Goethe, an eminent figure in the German book-trade of the Revolutionary and Napoleonic era. This work bore the imprint of John Murray; and hardly yet out of mind is Samuel Smiles's chronicle of the house of Murray under the rule of the second John (1778-1843). Now we have a like record of the house of Barbèra in Florence, from the beginning to the founder's death in 1880. As Gaspero Barbèra was born in 1818, he was a contemporary of both the German and the British publisher; and the three works illustrate in a remarkable manner the condition of literature and of book-publishing for a full century in three countries, amid the greatest political and social changes. They are alike in being a mixture of memoirs and inedited letters, with lists of books published, negotiations and contracts with authors, biographical sketches of some of these, notes of failures and successes, extracts from reviews (sometimes *cooked*, in Germany), complaints of piracy (Irish from English and Scotch houses, Neapolitan in Italy). But whereas the Göschen and Murray volumes have a literary form, the *Annali* is openly a *catalogue raisonné*. There is no doubt that the latter offered a simpler task; indeed, the interest commanded by the works of Viscount Göschen and the late Mr. Smiles proceeds more from richness of material than from constructive art. We are inclined to think that the brothers Barbèra have produced a more satisfying presentation, and have not less effectively exhibited the character of their sturdy father, the physiognomy of the group of scholars, publicists and statesmen by whom he surrounded himself, and the quality of his output. Their skill is to be estimated highly, and they have rendered an invaluable service to the history of Italian patriotism and letters.

A controlling reason for their not attempting the Göschen-Murray form of chronicle was that there existed already an autobiography of their father, 'Memorie di un Editore' (Florence, 1883), a work deserving to rank with the best of those portraying the careers of self-made men. Gaspero Barbèra was a native of Turin, of humble parentage but with a rich inheritance of character. He owed a heavy debt to Franklin's Autobiography, which he repaid by publishing in 1869 a competent translation of that work, executed by the Milanese Pietro Rotondi, and, later, the American sage's miscellaneous writings; intercalating from similar motives a selection of lives from two works by the author of 'Self-Help.' Barbèra's fixed aim was to carry his religion into his business, and to assist in the moral uplifting of his countrymen, in the spirit of Massimo D'Azeglio's famous phrase—"Fatta l' Italia, bisogna far gl' Italiani" (Having made Italy, we must now make Italians). He was eminently successful in this purpose through the popularization of classical Italian literature in text-books, "collections," and otherwise, at a time when "literature divorced from politics appeared academic"; acquiring fortune for himself and universal esteem. "I do not," he said, in arranging terms with an author, "regard myself as a merchant—in the sense commonly attached to that word." The poet Aleardi dubbed him "honest publisher (*onesto editore*)· two words which fight in other cases; in yours, embrace." And on the side of his craft, in which he took the greatest pride, Massimo D'Azeglio gave him the reputation of being "No. 1 in Italy." He earned the frequently expressed gratitude of the rising Carducci for liberal treatment and encouragement "in male acque" as colaborer and adviser.

Copious yet strictly pertinent quotations from these Memoirs supply a connecting tissue for the Catalogue proper, and at the same time greatly enhance its readability. Conspicuous instances are Barbèra's relation of his visit to Massimo D'Azeglio, when 'I Miei Ricordi' was placed in manuscript in his astonished hands, with a result best summed up in the figures of a sale of 55,000 copies of the printed work; and the pathetic account of his farewell visit to the statesman on his deathbed. Besides such merited revival of the autobiography, the sons contribute further a large amount of business correspondence from which Barbèra's high tone, fairness, disinterestedness, liberality, and excellent literary judgment shine out unmistakably. Those who are prone to abuse publishers as sharks, may here find candid revelations of lofty endeavor at the publisher's own risk, ending in discomfiture, and some amusing samples of extremely plausible forecasts by ardent authors overcoming the reluctance of Barbèra, only to justify it completely—at his expense.

The hundreds of letters and critical appreciations contained in this generous volume make it a literary performance and almost event. The compilers have avowedly had in mind a contribution to an Italian Biobibliographical Dictionary, and in particular to the future *epistolario* of Giosuè Carducci. This poet and scholar first appears on the scene with No. 40 of the Catalogue, as chosen editor of Alfieri's Satires and Minor Poetry, both furnishing a preface and controlling the text. The year is 1858, when he was, at twenty-three, still an obscure youth in spite of his doctor's degree and of the maturity of his intellect and breadth of culture. Editions by him of Tassoni and Parini followed; of the poems of Lorenzo de' Medici; of Giuseppe Giusti, with another masterly preface revealing the great prose writer—a work still in demand; of Salvator Rosa's Satires, Odes, and Letters—"the most elegant prose, academically speaking," of all Carducci's, in his own estimation. And now (1860), at twenty-five, Mamiani calls him to the chair of Italian literature at Bologna, from which he has just retired, the idol and pensioner of the nation. The next year he reviewed in the *Nazione*, the liberal daily printed by and under the management of Barbèra, a canto of Aleardi's, 'I Sette Soldati,' issued by the same firm. He signed with a C., whose identity is now first revealed, and the critique is reproduced in part, ending with an extract from the poem that might well be Carducci's own. Here, along with just discrimination, is observable that generosity towards fellow-literati so characteristic of the man. For the *Nazione* he also wrote (1862) a remarkable review, quoted entire, of Aleardi's 'Canto Politico.' With No. 138 (1863) we come upon the 'Stanze' of Poliziano, proposed by Carducci to Barbèra in 1857, and the first Italian text edited in accordance with the methods of modern criticism, by one who was regarded as above all a poet, and called in Florence an unbridled poet. (It was the period of the "Hymn to Satan," of the "Giambi ed Epodi.")

The first creative work of Carducci's published by Barbèra was his 'Poesie' (1871), including the *Decennali* or his "knight-errant" verse written in the sixties; and his real name stood upon the title-page beside "Enotrio Romano," the *nom de guerre* of his first venture. The correspondence over this volume is of marked importance for the biography of the poet. The correspondence under No. 269 gives a lively portrait of the scholar whose "wait a bit" (to his publisher)—*attender corto corto*—had become the habit of his soul, from his mania for doing well, *molto bene*. In his proposal to edit Baretti he makes a fine display of his bibliographic knowledge and his scrupulous labor in comparing editions. For his Horace he proposes a few odes in the Venetian or Sicilian dialects, and lays out a stupendous programme of editorial labors, while confessing his detachment from the world and his being out of sorts. Of his work on Petrarch since 1860, he says no one was capable of it but himself.

Here we take leave of him for a momentary glance at two or three other conspicuous figures in Barbèra's roll of honor: Massimo D'Azeglio first of all. Of his 'Ricordi' we have already spoken. His correspondence with the house extends from 1857 to 1865. What of it we have here is very interesting, in a political and a literary point of view. To Barbèra this statesman was justly an object of the highest admiration, and he secured the

publication of his posthumous writings. To his establishment came also General La Marmora, in 1873, for utmost privacy in printing that startling revelation of the diplomacy of 1866, 'Un po' più di luce,' which had a great vogue and involved the author in much official and public censure, and caused Bismarck an uncomfortable quarter of an hour in the Prussian House. A further autobiographic defence against aspersion was La Marmora's Genoese 'Episode of the Risorgimento' (1875), and Signor Piero Barbèra served him as secretary in editing his 'State Secrets in a Constitutional Government' (1877), an attempt to forestall an addition to the penal code aimed at the "indiscretion" of 'Un po' più di luce.' (The Secretary found the General not at home in the use of Italian.) Other notable successes grew out of the early discernment of E. De Amicis's talent when at twenty-five he put together his 'Ricordi [of 1870-71],' after making his début in the *Nazione*. This author's correspondence with his publisher is very engaging. The Marquis Gino Capponi's History of the Republic of Florence is another landmark in our Catalogue. Nor should we omit mention from the galaxy of scholars of Prof. Giovanni Mestica, whose correspondence outbulks any in the archives of the house in the Via Faenza, whose painstaking knew no bounds, as one may see from his incomparable edition of Petrarch, and who died only two years ago.

We recur in closing to the comparison we instituted in the beginning, odious though it be. The *Annali* easily surpasses the Göschen and Murray memorials in one particular, namely, beauty of manufacture. Here is a real monument to a master printer—in proportions, paper, elegant diversity of type, scrupulous proof-reading (we recall no obvious error more serious than the omission of a space between two words), exact fidelity to originals in quoting (as one familiar with Carducci's peculiarities of punctuation may observe), tasteful binding. We must also speak of the judicious employment of facsimiles, one being the fond father's endorsement of the first matter set by his eldest son when learning the printer's art; of Gaspero Barbèra's portrait for frontispiece; and of the appended Catalogue of the Collections (Yellow, Diamond, etc.), and List of Books, Pamphlets, and Periodicals of any importance printed on commission, with an index; plus an index of commentators. Taken together, this pious work is a treasury of Italian style and literary portraiture, and an ornament to the world's stock of fine book-making.

THEODORE WATTS-DUNTON.

Theodore Watts-Dunton: Poet, Novelist, Critic. By James Douglas. John Lane. 1905.

Mr. Douglas's vicarious autobiography of the mind of Theodore Watts-Dunton is in plan and execution pretty much everything that a study of a living man of letters ought not to be. In the case of a man like Watts-Dunton, who has produced such multitudinous and multifarious work, and has been so little careful to preserve it, the reader would have welcomed a systematic outline of it, some hint of the chronology of the author's life, and full and accurate bibliographical references. At all of these points, however, Mr. Douglas is to seek. There are no exact references to the *locus* of any of the very numerous quotations from Mr. Watts-Dunton's work, and even our justifiable curiosity as to the date of his birth is not satisfied. In the index, too—if one turns to it for aid in searching out details of information—will be found such illuminating entries as "Wilderspin: See Smetham, James," and under "Smetham, James," "See Wilderspin"; and the same quality of workmanship is observable in the actual writing, in which discontinuity of periods and incoherence of paragraphs are paralleled in the structure of the book as a whole. It has the architectonic of a wounded snake.

Nor is the temper of Mr. Douglas's approach to his subject quite so cool and discreet as might be desired. He has a talent for tall talk. "Undoubtedly," he says, "the greatest philosophical generalization of our time is expressed in the four words, 'the Renascence of Wonder.'" This will cause surprise to many philosophers. Mr. Douglas's high-erected vein seems in some cases to come from a lack of full literary information. He says, for example, speaking of the part played by Philip Aylwin after his death in shaping the course of the story of his son, "This effect of making a man dominate from his grave the entire course of the life of his descendants seems to be unique in imaginative literature; and yet although the fingers of some critics (notably Mr. Coulson Kernahan) burn close to it, there they leave it." Surely Mr. Douglas has forgotten his Hawthorne, to mention no others. It is remarks like this that give at times to Mr. Douglas's book almost the accent of a burlesque *éloge*.

Fortunately, however, there is not very much of Mr. Douglas's own writing in the book. He has wrapped his slender shanks with such ample swathing of his author's work that they make a very presentable appearance. His native Boswellian tendencies, which he frankly avows, have been strictly repressed by Mr. Watts-Dunton, so that, while we do indeed have some interesting pictures of Mr. Watts-Dunton's mutually fructifying friendships with George Borrow, William Morris, Swinburne, Rossetti, and others, the chief value of the book is as an anthology of Mr. Watts-Dunton's scattered and too little known work in criticism, in fiction, and in verse.

Those who have known of Mr. Watts-Dunton as the chief poetic critic of the *Athenæum*, as the author of that curious novel, 'Aylwin,' or as the faithful Achates of Mr. Swinburne, will be surprised at the amplitude and variety of his interests as they are presented here. In early life he was, as we discover, a student of science, and for a time looked upon that as his career. Later he was a barrister and a student of music; and then, in order, as Mr. Douglas tells us with unction, a society man, a poet, a critic of art and letters, a novelist, and, all the time, a first-hand investigator of gypsy life and lore, and a poet. Mr. Douglas's meditations upon the Renascence of Wonder have so tinged his mind with that quality that he considers each of these pursuits with something like awe. Seen through the perspective of over-seas, they inspire interest rather than awe, as explaining some of the peculiar quality which has impressed readers of Mr. Watts-Dunton's work.

The salient merit of that work, as it has been seen for thirty years by readers of the *Athenæum*, is its consistent ideality. The poetic reviews written by Mr. Watts-Dunton and the personal articles from his pen have always shown something of the freshness of view of a Romany Rye, something of the psychologizing of a student of modern thought, along with an unflagging perception of the inner spirit of poetry. While they have been streaked with the occasional flatness of tone that is the inevitable result of composing by dictation, and have never quite shown that admirable low-voiced quality of style which is at present the ideal of literary good manners, or quite the "silkiness" which Mr. Douglas finds in them, they have been always resourceful in phrase, and often extremely picturesque. How admirably suggestive, for example, and cleanly phrased is this bit of criticism which Mr. Douglas has resurrected from an old review:

"One great virtue of the great masters is their winsome softness of touch in character drawing. We are not fond of comparing literary work with pictorial art, but between the work of the novelist and the work of the portrait painter there does seem a true analogy as regards the hardness and softness of touch in the drawing of character. In landscape painting, that hardness which the general public love is a fault; but in portrait painting, so important is it to avoid hardness that, unless the picture seems to have been blown upon the canvas, as in the best work of Gainsborough, rather than to have been laid upon it by the brush, the painter has not achieved a perfect success. In the imaginative literature of England the two great masters of this softness of touch in portraiture are Addison and Sterne. Three or four hardly drawn lines in Sir Roger or the two Shandies or Corporal Trim would have ruined the portraits so completely that they would never have come down to us."

We are not of those who hold with Rossetti that "the subtle and original generalizations upon the first principles of poetry which illumine his [Watts-Dunton's] writings could only have come to him by a duplicate exercise of his brain when he was writing his own poetry." For, despite the unremitting picturesqueness of such poems as "The Coming of Love" and "Christmas at the Mermaid," despite their mystical burden and occasional lyric lift, there is discoverable in them rather the considerate intelligence of the critical mind than the irresistible impulse of the creative. Indeed, the critical doctrine, or philosophic lesson, seems to shape the creation from outside, rather than to lurk, fluid, in it. An excellent illustration of this is the piece of vivid criticism to be found in a passage which Mr. Douglas has printed from an unpublished romance. Dereham, by whom we understand George Borrow, and the author have been discussing the poetic quality of Arnold's "Scholar Gypsy." They conclude to leave it to the first gypsy girl they meet on the road as umpire. Meeting Rhona Boswell, they read it to her, with this engaging result:

"Glanville's prose story, upon which Arnold's poem is based, was read first. In this, Rhona was much interested. But when I went on to read to her Arnold's poem, though her eyes flashed now and then at the lovely bits of description—for the country about Oxford is quite remarkably like the country in which she was born—she looked sadly bewildered, and then asked to have it all read again. After a

second reading, she said in a meditative way: 'Can't make out what the ill's all about. Seems all about nothink! Seems to me that the pretty sights what makes a Romany fit to jump out o' her skin for joy makes this 'ere gorgio want to cry. What a rum lot gorgios is surely!' And then she sprang up and ran off toward the camp with the agility of a greyhound, turning around every few moments, pirouetting and laughing aloud."

Surely the pathetic fallacy of the gorgios was never more picturesquely put. But we suspect that the critical doctrine determined Rhona's speech.

The striking thing about Mr. Watts-Dunton's ostensibly creative work, as it is disjointedly summarized in this book, is the curious solidarity of the circle of people who move in all of it. The group of passionate and moody poets and artists with whom his life has been spent, a handful of gypsy types, and the family of Aylwins—whom Mr. Douglas has punctiliously identified with the Wattses—are his stock characters. One feels, it must be confessed, that Mr. Watts-Dunton has been rather the fortunate secretary and reporter of one of the most interesting circles of his time than quite the marvellous creative artist that he has seemed to the young men in England, perhaps with poems in their pockets, who have bowed before the poetic critic of the *Athenæum*.

Mr. Douglas has reprinted in full many interesting and characteristic reviews and articles from the *Athenæum*, but the greater part of the texture of his book is made up of excerpts from 'Aylwin,' and it is most probably by 'Aylwin,' considered rather for its doctrine than for its form, that Mr. Watts-Dunton's place in literature is finally to be determined. There is no question that 'Aylwin' is in many respects one of the most interesting books of the last decade; but to a quizzical age not yet wonted to the Renascence of Wonder, some parts of it must always seem feverish and overwrought, some a little foolish. The "Aylwinism" which has been so enthusiastically and insistently preached by many English reviewers, does not seem in its entirety likely to become the dominant artistic and religious creed of the new century. But Mr. Watts-Dunton must not be judged solely by the crudities of his admirers. The Renascence of Wonder—his excellent formula for the great romantic movement as it is exemplified in 'Aylwin'—means a very special kind of wonder. It is not the blindly mystic bewilderment for which it is sometimes mistaken. It is rather the "keen-eyed wonder" of which young Lowell sang. It does not shut its eyes to the methods and results of science, or to any of the so various phenomena of modern life. As it is presented in 'Aylwin,' despite many unpleasant strains in that book, it does make for a recognition of the invisible realities that are life. The core of all of Mr. Watts-Dunton's work is in the concluding lines of his fine apostrophe to Natura Benigna:

> "Dumb mother, struggling with the years to tell
> The secret at thy heart through helpless eyes."

In this groping for the meaning of nature he is at one with the endeavor of the scientists, yet what he has done has made undeniably for faith.

THE DAWN OF RECONSTRUCTION.

History of the United States from the Compromise of 1850. By James Ford Rhodes. Vol. V. Macmillan. 1904.

Mr. Rhodes's fifth volume opens with Sherman's march to the sea, and closes with the Congressional elections of 1866 and the remarkable performances of Andrew Johnson in his contest with Congress. It thus covers less than two years of the nation's history; but as those two years were replete with interesting and important events, the space devoted to them is not too great. The writer's method and his even narration make pleasant reading. There is the same painstaking examination of authorities, the same skilful arrangement of facts, the same balanced (sometimes hesitating) judgment, and the same desire to be eminently fair to all parties in a controversy. To have steered one's way through the many quarrels and differences engendered by the civil war without becoming involved on one side or the other, is a great feat; and to have done this in a manner which has won the confidence of ardent partisans to those controversies is a high tribute to the correctness of procedure laid down by Mr. Rhodes at the outset and steadily maintained through the course of his work. He describes the management of the military prisons in the North and in the South, without giving occasion for a charge of partisanship or unnecessary coloring of his facts. He seeks to explain the burning of Columbia, and almost leaves one in surprise that any controversy could long rage over that catastrophe. His account of the Fort Pillow massacre distributes the blame in such a way that the Northern critics must answer a charge of remissness of duty on the part of those who should first have investigated the matter. In his effort to be just, Mr. Rhodes sometimes leans to excessive caution. Who would explain, as he does, an application of the term "irresponsible" to the romancing Sala? He hesitates about the actual proof of Butler's dishonesty, while admitting that an atmosphere of corruption followed and surrounded the man wherever he was placed. On mooted points Mr. Rhodes has again demonstrated his high ability, and while it is impossible to assert that he has silenced controversy, he offers a model of investigation and calm judgment.

Sherman's march to the sea and the surrender of Lee and Johnston brought peace and a necessity of facing the problems of administration that a peace involved. In two chapters Mr. Rhodes describes the social conditions in the North and South, and endeavors to show the results of the war upon the daily life of the people. That the North bore the contest so easily is attributed to the fact that an era of prosperity, a recovery from the effects of the panic of 1857, was due. As wages did not rise with the increase in prices, the benefits were not evenly distributed. The heavy expenditures of Government gave a feverish activity to certain industries, and the gambling spirit was encouraged by the fluctuations in the value of the greenback and by the unhealthy tone of the money market. Even in the South the free capital went into blockade-running, or was invested in lands; manufactures benefited but little. At the North the frauds in Government contracts were great, but did not equal those of the bounty brokers—the forerunners of the later pension agents. Mr. Rhodes seems to accept the theory that luxury was a fertile cause of the exports of specie; thus reversing the usual explanation of economists. Bad as the issues of paper were at the South, a legal-tender act was never passed.

The States exposed to actual war naturally suffered, and in the South the destruction of life and property was such as seriously to weaken the power of recovery. This power was normally less effective in the slave States, and the better business organization and ability of the North enabled it to come out of the conflict with no serious economic trouble, apart from its paper money. The moral tone of the country was in one phase elevated by the patriotism displayed. The war had a sobering effect. In another phase the morals of the country were weakened by the war spirit and its incidental as well as necessary evils.

But is it true that, in the slave States of the South, before and during the war, a greater regard was paid to liberty? Personal liberty may consist with extreme social selfishness, and the laws and policies that grew out of State's rights and jealousy of executive power could not imply liberty in its highest sense while millions remained slaves. Burke's statement, which our author endorses, that where there is a vast number of slaves, "those who are free are by far the most proud and jealous of their freedom," is a paradox. With much greater justice, Mr. Rhodes calls attention to the difference between the executives in the two sections. "The Federal Government may be called a dictatorship; Congress and the people surrendered certain of their powers and rights to a trusted man. The Confederacy was a grand socialized State in which the Government did everything." Paternal government is a denial of individualism—and liberty.

The war was over, and the question of the political status of the people lately in rebellion was pressing. Sherman's well-intentioned concessions to Johnston, involving some of the leading problems of reconstruction, were promptly disavowed by the authorities at Washington. Mr. Rhodes believes that Sherman's defence of the conditions is worthy of consideration, and condemns Stanton's reckless disregard of official secrecy and honor in making public the implied reprimand to Sherman, while attributing it to the excited condition of Stanton's mind at the time, and to his want of personal courage. For Lincoln Mr. Rhodes's admiration is unbounded, and when treating of his words and acts he most closely approaches enthusiasm. Lincoln was the best friend of the South; his mild and forgiving policy was based upon the highest statesmanship. He had the confidence of the North, and was winning that of the South. He would have had a Congress elected upon his own platform, and his breadth of purpose would have enabled him to win against opposition by a judicious concession of less important details. His death closed an epoch. While the manner of his end created a feeling that told against the full reconciliation of the two sections of the country, the accession of Johnson was hailed by many as a change for the better. Of Lincoln, Mr. Rhodes says:

"In all the steps which Lincoln took, there was an Anglo-Saxon adaptation of the

means at hand; the process was tentative. A wise Executive could modify his plan according to circumstances, and therefore could carry out the work, as long as a state of war existed, better than if he were hampered by a cast-iron rule of Congress. For such an affair of statecraft Lincoln by his training and experience was especially fitted; his action seems to show the practical wisdom of the Anglo-Saxon."

Lincoln's attitude towards Reconstruction had been opposed by Stanton and by the Committee on the Conduct of the War, through Wade, its chairman. Johnson was known to be outspoken against "traitors," and very earnest in demanding that they be punished. The party leaders looked upon him with greater favor than Lincoln, whose views of mercy were not palatable to them. Johnson made no pledge to carry out Lincoln's policy, yet in the summer of 1865 he had so far changed his views about reconstruction as to surprise both friends and enemies. Peace altered the conditions which prevailed under Lincoln; Stanton yielded on the question of imposing negro suffrage upon the States by Federal authority, and supported the President. Sherman and Schofield, then in North Carolina, were opposed to granting the suffrage, and Johnson's action in establishing provisional governments in the States did not recognize it. The absence of well-defined political parties in the South made the task of beginning other than military governments more difficult. "State and Congressional elections took place at regular periods; but as no principle was involved in them, they excited little interest and determined practically nothing." Unwise and unfriendly legislation respecting the freedmen gave good ground for suspecting the sincerity of the protestations that slavery was abolished beyond recall, and the President's course was hampered by this legislation and the suspicions awakened by it.

Mr. Rhodes believes that had Johnson called an early session of Congress, some common ground for agreement might have been found. Yet Johnson was his own worst enemy. He did not understand Northern sentiment; and he was a State's-rights man applying the principles of State's-rights to communities which, in the belief of many, were not States. Opposition intensified his obstinacy, and he was gradually led into resuming his old party affiliations. Failing to secure assent to his own policy of reconstructing the States through the Federal Executive, he resisted the plans of Congress, which after all embodied most of the essential features of his own policy. Sumner, Wade, and Stevens insisted upon the full right of Congress to impose reconstruction on the States lately in rebellion, and the subsequent legislation placed the President in a position that called out the worst points of his character. Mr. Rhodes believes that the Southern States would have received a plan that gave to the negroes full civil rights and a qualified suffrage. He shows that popular opinion was generally with the President, and the majority of the Congress of 1865 was nearer to the President's views than to those of Stevens and Sumner—until the veto of the Freedman's Bureau bill. He is plainly on the side of Congress, expressing surprise that Johnson should have vetoed that measure. Yet the veto appears to have been based upon the advice of Brigadier-General Fullerton, who had been in charge of the Freedman's Bureau, and was therefore in a position to advise with authority. It is difficult to prove that the author is unfair to Johnson, yet the case of the President was a strong one, granting certain assumptions which the Executive could make. Mr. Rhodes thinks that it would have been safe to permit the States to work out the negro problem under the restrictions of the Freedman's Bureau and military occupation. But both these measures were temporary; would it not follow that Congress alone could provide for the permanent settlement? And, in insisting upon conditions that were punitive and vindictive, did not that body err as greatly as did the President?

We wish we could follow Mr. Rhodes in this important chapter, for, as in everything he writes, his fairness is striking, even when his conclusions do not seem to be borne out by the facts.

Methods of Industrial Peace. By Nicholas Paine Gilman. Houghton, Mifflin & Co. 1904.

This is the first comprehensive book on the various methods of adjusting disputes between labor unions and employers or employers' associations. It consists of some four hundred pages divided into sixteen chapters, treating in general of the present-day combinations of both employees and employers, of the aims and methods of trade unions, mediation, conciliation, and arbitration, and finally of legal regulation of labor disputes. The work is not a first-hand study like Webb's 'Industrial Democracy,' but is based almost wholly on secondary sources. It is mainly descriptive, paying little attention to development or extended comparison. A large part of Mr. Gilman's sources are English, and in his discussion of the aims and methods of trade unions he is led to generalize too broadly on English experience. Indeed, the author proceeds frequently on the assumption that conditions are alike in the three countries—England, New Zealand, and the United States.

The author says (p. 35), without qualification, that the local union exercises all the functions of trade unions in that it determines wages, hours, apprenticeship, etc. This is certainly not true of the more important American unions such as the Typographical, the Steel, Tin and Iron Workers, the Bricklayers, and the Iron Moulders. He says (p. 234) that the organization of unskilled workingmen has been "unsuccessful in England, and the attempt has not even been made in this country." As a matter of fact, there are at least a dozen large national organizations of unskilled workers. For more than five years, the whole system of unionism in the United States has been rapidly changing to the industrial form, wherein are included the skilled and the unskilled, such as the Mine Workers, the Brewery Workmen, and the Butcher Workmen. Aside from these, powerful organizations of teamsters, hod-carriers, waiters, elevator conductors, janitors, and window-washers have come into existence.

Mr. Gilman considers (p. 238) the union label as of no importance, basing his conclusion on the words of a labor leader—"We hope nothing from the label"—and on an investigation made in one city, published as a magazine article. There are some trades in which the label cannot well be used, and the labor leader in question may have belonged to one of them; but even if the label were as much in demand in all the larger cities of the country as in Milwaukee, the city investigated, it would nevertheless be of considerable importance. That the label is of importance is evidenced by the fact that several national unions, such as the cigarmakers and the garment workers, have been built up on it. There have been several instances where the union label has been counterfeited, a practice not likely to occur unless the original were of value.

In regard to apprentices, the author says (p. 232) that trade unions were formerly the subject of much criticism because of their rules regulating the number of apprentices. He mentions a strike in New York in 1809 on account of apprentices, and, after giving several cases of such regulation in England, states that only 15,000 of 1,500,000, or only 1 per cent. of the unionists in that country, enforce apprentice regulations. He concludes that the whole system of apprenticeship has been so disintegrated in modern times that the rules of unions are of little importance and the question of apprentices lacks actuality. As a matter of fact, there are but few, if any, of the nearly one hundred organizations of skilled trades in the United States that do not have and enforce apprenticeship regulations. A majority of the agreements with employers that Mr. Gilman cites as typical contain clauses regarding the apprentice. It should at least have been known to the author that of the problems considered by the conference board of the Iron Moulders and the Defence Association, which he characterizes as the most highly developed system of collective bargaining in this country, the most difficult problem next to wages has been the subject of the union regulations of the apprentice.

The author's treatment of mediation, conciliation, and arbitration is much more satisfactory; but even here the discussion is often diffuse, especially in the chapter on collective bargaining, and throughout there is not that successful search for underlying principles which distinguishes the work of Mr. and Mrs. Webb on the trade unions of England.

In the chapter on the incorporation of labor unions, Mr. Gilman gives (p. 151) a lengthy résumé of the testimony before the Industrial Commission on this subject, and then shows how the unions registered in England are practically incorporated according to the Taff Vale decision. He argues that incorporation is necessary to put the unions on the same standing as employers, and speaks of the "illogical and immoral unwillingness to become incorporated." But here the author is not altogether just to the unions. Many labor leaders say that they would be heartily in favor of incorporation if its effects were merely to make binding the agreements entered into with employers. They claim that, as the criminal law is sufficient to reach cases of lawlessness, they see no reason why a way should be opened for hostile employers and employers' associations to mulct the treasuries of the unions or tie up their strike funds when they should be most needed. The testimony before the Industrial Commission, on which the author large-

ly bases his arguments for incorporation, was given before the Taff Vale decision was rendered. That decision has changed the views of many who formerly favored incorporation.

The author also says (p. 176) that the incorporation of employers' associations is a requisite to industrial peace, and quotes from the Report of the English Royal Commission of Labor for 1894—ten years ago. Almost all of the successful systems of collective bargaining in this country are carried on by unincorporated associations of employers. None of these now demand that the unions incorporate. It may not be without significance that the demand for incorporation comes mainly from employers and employers' associations which are opposed to trades unions as such.

The author is inaccurate in saying that the principle of the Taff Vale decision was applied recently to the Franklin Union of Press Feeders of Chicago when that union was fined by the court for disobeying an injunction, and again when he says (p. 196) that the boycott suits now pending in the Federal courts against the Hatters' Union may furnish another such instance. The Franklin Union, which has since given up its charter, was one of the few incorporated unions in the country, and naturally could be fined like any other incorporated body, while in the case of the Hatters the union is not incorporated, and the members are sued as individuals, and not as a union.

After describing the Governmental control of strikes in New Zealand, the author makes a plea for such regulation in the United States. It cannot be said that he gives much consideration to objections, although he does notice (p. 407) the consideration that "Governmental control would be a half-way house to Socialism." Yet he considers that objection answered when he replies: "It is not necessary, because I go half way towards the Pacific Ocean, that I shall continue my course until I am drowned in it." On the practical side, it should be noticed that the whole number of workmen in New Zealand does not equal the number in some of our largest unions. The industry of New Zealand is insignificant as compared to the extent and diversity of the industries of the United States, and it can readily be seen that the power granted the court in New Zealand of fixing wages and labor conditions throughout these islands could not give satisfaction here, nor serve as well as the systems of collective bargaining that are being worked out in some of these industries with characteristic American independence and originality.

Upon the whole, however, the book is of value. In spite of its inaccuracies and occasional unfairness, it contains much information presented in a readable way, with many references to secondary and some to primary sources. In justice to the author it must be said that there exist few original studies of the various aspects of American trade unions, upon which a general work of this description might be based; yet it must also be said that he has generalized too broadly on insufficient evidence, and has been influenced too much by his prepossession for State regulation to give an unbiased interpretation of the strivings of the leaders of employers and of employees towards satisfactory methods of industrial peace.

The Road in Tuscany: A Commentary. By Maurice Hewlett. In two volumes, with illustrations by Joseph Pennell. The Macmillan Co. 1904.

A book-notice need not always be like an epigram—little and sweet, with a sting in the tail. Let us this time at least reverse the order. Here are two volumes in washday blue—not inexpensive volumes, either, and not unduly large—yet they might have been expressly concocted for the spite of the author and the torment of the reader. They are leaden in their ponderosity, and when the book is once poised before the eyes, to hold it open for the space of two pages' reading is like riving Milo's oak. The only thing to do is to lay it on a table, or book-rest, and break it down the back (this last can be done at any signature); and even then the stiff leaves curl up with petulant insistence. In such a discouraging prison is confined the rich fancy of Mr. Hewlett's fertile imaginings. Perhaps this is the price we are called upon to pay for the bountiful store of Mr. Pennell's drawings; but it is an unnecessarily hard price.

Possibly our preliminary impatience makes us think the illustrator not at his best in these volumes. His later style appears to us, at any rate, not as pleasant as his earlier. That sharp and sure pencil-point (of which we find some work even here) fitted better the interpretation of shivering light and lambent shadow than do some of these masses of crayon blackness, which too often give us a tumbling and amateurish perspective, and in the printer's hands at times degenerate into smudginess.

Mr. Hewlett should be the ideal artist to paint in words the road through Tuscany, for no man has so comprehendingly idealized Tuscan life and character. If the Italian of that soil be not what Mr. Hewlett makes him in the delicately gorgeous tapestry of his wonderful tales, then let no man ever weep again that Ilaria del Caretto sleeps in dust, nor yearn again to bathe his weary feet in the noontide coolness of an Apennine brooklet. Yet Mr. Hewlett seems to us better in the individual vignettes of this book than in its panoramic passages and effects. Where he essays to depict, as he does sometimes in professed allegory (a little tediously), and sometimes in more straightforward guise, the movement of events, we get the overwhelming massing and swirl of all-intent giant forces, but not a clear idea of "what they killed each other for." It is almost too nearly like his own characterization of a certain fresco in the portico of the Annunziata at Florence: "In the foreground is a heap, a fricassee, a salad of naked mammoths in human guise, . . . fawns, heroes with clubs, demigods, deuce knows who or what is not in this writhing mass." Furthermore, we are sometimes cloyed with mere preciosities of verbiage—purple patches on a noble garment of stately folds. We would fain see the forest, but the neighboring trees distract our attention and block our view. Why, for instance, need charm and magnificence and such like things be a dozen times dubbed "perdurable," and never once simply "lasting"? Mr. Hewlett is more than a fantastic lord of language.

The *road* in Tuscany, says Mr. Hewlett, and never the railway, for which, and for all that runs therewith, he feels a Ruskinese contempt—though, be it noted, he does not always love Ruskin down to the bottom of the depths. But, once we are valiantly settled for the road, Mr. Hewlett begins to hedge and compromise, and to quote high authorities for the golden mean. Let us not be too hasty in swinging knapsack to shoulder. The extreme counsel is a counsel of perfection. Mr. Hewlett would not "pitch his pipe too high." No footweary days for him, but rather the *al Milord* style of a carriage and four—or, let us say, two—with Dante and Sacchetti for hourly comrades, and Herr Baedeker (as he is always entitled, with lamentably disrespectful intent) tucked away under the seat, to be summoned into consultation only to be snubbed, or when Dante, like a true Tuscan, falls lightly asleep in the afternoon glare. So we traverse highway and byway, town and hamlet, upland and lowland, at the leisurely pace of some six miles an hour, and sleep in the midst of heavenly visions, and all is ethereal fire and color and bewildering charm, and the people know neither good nor evil any more than once did Adam and Eve, and the inn-keeper's wife in the Garfagnana is a woman more lovely than any who can now be ministering to Mahomet. We need hardly ever go inside a church, and never into a museum, nor ever look at a picture unless we happen to like it; and we are swept blissfully forward through all this exquisite phantasmagoria of brilliant sights and sounds and imaginings upon a billowing tide of gloriously resonant names like those which spread their glamour over all ancient poetry. In short, Tuscany with Mr. Hewlett is more Paradise than ever, though we already thought it Paradise enow.

Papermaker, and binder, and the little demon of the commonplace have called seductively upon us to curse, but we have blessed. For even here, in the bleakness and dulness of this western world, Mr. Hewlett has again given us sundry hours of beatified vision into a distant, though perhaps not forever lost, Elysium.

Chinese Made Easy. By Walter Brooks Brouner, A.B., M.D., of Columbia University, and Fung Yuet Mow, Chinese Missionary in the City of New York. With an introduction by Herbert A. Giles, M.A., LL.D. (Aberd.), Professor of Chinese in the University of Cambridge, England, and late H. B. M. Consul at Ningpo. New York: The Macmillan Co. 1904.

This is a handsomely got-up book, with a red cloth cover and a gilt dragon impressed on it. The title-page is on the right hand and the pages of the book follow from right to left as in a Chinese book. This and the title will no doubt attract purchasers, especially novices in matters Chinese and the study of languages generally. It seems a pedagogic mistake, however, to call any study "easy" if in reality you expect a student to muster all his energies in tackling what everybody knows to be a difficult subject. Although the difficulties of the Chinese language have been greatly overrated by many, there is not the slightest doubt that Chinese is not easy and cannot be made easy. Students who may trust to the bait thus thrown out to

them will find themselves sorely disappointed in finding, in the end, that they have thrown away much valuable time, and must start by another method if they are really anxious to arrive at a certain competency in either speaking or reading Chinese.

'Chinese Made Easy' is a misnomer to begin with. Which kind of Chinese do you wish to study? The written language, or the colloquial? If the latter, which dialect? The selection of a dialect depends, of course, essentially upon the use to which a student is going to put the knowledge to be acquired. Of all the dialects known to China, the one most generally in use is the court dialect of Peking, and a student who judges this book from its title may expect to be taught this idiom rather than a dialect of merely local importance. What 'Chinese Made Easy' teaches is one of the dialects spoken in the Canton province; it is not even pure Cantonese, as a comparison of numerous sound transcriptions with any of the well-known standard works on the Canton dialect, such as those of Eitel, Williams, Chalmers and Dyer Ball, will show. The spelling of Cantonese sounds adopted in this book is meant to be practical, no doubt, and it may be of some use to English-speaking students of the lowest standard of education; but it marks a fundamental departure from the spelling adopted, ever since S. Wells Williams's Dictionary of the Canton Dialect, by all authors of handbooks and dictionaries of the dialect. The student who may have gone through this book will have to forget what he has learned and study a new orthography, if he wants to make use of those important helps.

The method adopted is also of a practical kind. It would certainly commend itself for the study of the Canton dialect but for the shortcomings above explained. With the exception of a useful choice of Chinese characters and a well-printed reproduction of the text of the Chinese primer San-tzi-king, 'The Three Character Classic' seen in the hands of Chinese school boys, the book contains no matter calculated to impart any knowledge of the Chinese written language, so entirely different from the several spoken idioms. To be pronounced useful the book should have for title 'Cantonese Made Easy,' and the spelling should be made to correspond with that adopted in all other works on the subject, local deviations and solecisms being changed into their proper equivalents in standard Cantonese.

The Land of Riddles (Russia of To-day). By Hugo Ganz. Harper & Brothers. 1904.

As the above title indicates, Mr. Hugo Ganz set out on his travels in the frame of mind of the man who has made up his mind to solve the mysteries of the Sphinx. His way of reaching his solution was to obtain a large number of interviews from people who must of necessity remain nameless, but are spoken of as "a Russian prince" (there are said, by the way, to be genuine Russian princes among the cab drivers of St. Petersburg), "a statesman," "a man in a very respectable position," "a Conservative aristocrat," etc. Undoubtedly this method has its advantages. It is an excellent way to obtain startling facts from people who, if they are sure that their identity will not be disclosed, are glad to profit by the chance to unburden themselves of their bitterness to a sympathetic listener. On the other hand, it has the disadvantage that the accuracy of statements thus made is more than difficult to control. Mr. Ganz for his part seems to have accepted what was told him as readily as he does the unhistorical legend of the blinding of the architect of the church of St. Basil in order to prevent the duplication of such a masterpiece. To him every kind of whip in Russia is a "knout"—an article which, in theory at least, is now relegated to museums. He declares, to be sure, that he set out on his journey without prejudices, but his state of mind may be inferred from the fact that he did not dare to bring a single book into the country except his Baedeker; hence he had a dull time looking out of the car windows. No wonder that he appears to have been filled with emotion while his passport was being examined. Then, though truth compels him to admit that "I did not experience the slightest annoyance throughout my entire journey; I was not subjected to police surveillance, nor did I notice in my meagre correspondence the least trace of police interference," he attributes this last circumstance "to the extreme precautions taken by me in sending my mail in inconspicuous envelopes." There is a good deal of truth in the saying that what we take out of a country depends chiefly on what we have brought in.

At the same time, even if we have to regard many of the assertions made by and to Mr. Ganz as "not proven," in themselves they accord too well with much that we have on other evidence for us to be able to reject them summarily. The views that were expressed to him, and which formed his judgment, may have been merely the opinions of certain discontented groups—and even the much-abused Chinovnik has his side of the case—nevertheless, the facts related are not only painful in themselves, but, alas! many of them all too likely. Recent events are proving beyond dispute how profound is the discontent at present existing among the enlightened classes in Russia, and few people will be found in the outside world to deny that that discontent is warranted.

In the non-political part of his book Mr. Ganz gives us his impressions of St. Petersburg and Moscow, of the Hermitage, of the Trediakovski Gallery, and of other similar subjects. There are a few instances of careless proof-reading in the volume, the worst of them being when Mme. de Staël's description of Moscow as a "Rome tartare" is made unrecognizable as "Roma tatae." The volume closes, as such a one was bound to do, with the inevitable but still usually interesting "Visit to Tolstoy."

The Secret of Petrarch. By Edmund James Mills. E. P. Dutton & Co. 1904. Pp. xii, 219; illustrated.

To one acquainted with the most remarkable of all Petrarch's Latin works, his Confessions—or "My Secret," as he was pleased to call them—Mr. Mills's book is a sad disappointment. The title seems to promise, at last, a good modern edition, or at least a translation or full description, of this precious little treatise, which has been buried for more than three hundred years in the slovenly Basel editions of Petrarch's *Opera omnia*. But, alas, aside from a brief commendation of the 'Secret' in his preface, Mr. Mills scarcely alludes to it, and it appears to have done little more for him than to suggest the name of the "drama" which occupies the latter half of his volume. In this he embodies the startling results of a series of "critical studies on various questions of interest relating to Petrarch and Laura" which form a prose prelude to his poem. These "critical studies" are based almost exclusively on the Canzoniere. So few are the references to Petrarch's discussion of his relations with Laura given in the 'Secret' that one wonders if Mr. Mills has taken pains to read the work for himself; and, singularly enough, he does not cite in his bibliography any edition of Petrarch's writings where it may be found.

Petrarch's Lady Laura has been the subject of much speculation. It is true that his Italian verses are largely devoted to her, but they furnish few, if any, cold facts which can be confidently pronounced such. One of his Latin metrical epistles and the 'Secret' have a little to say of her, and then there is the famous entry which Petrarch made on the fly-leaf of his Virgil upon her death. It is usually supposed that she lived, very possibly married, and died, in Avignon, and was buried in the Franciscan cemetery there. Mr. Mills, however, comes to very definite and quite different conclusions. Laura was a country maiden who "lived in a squalid farmhouse, probably on the clay opposite Pieverde [near Avignon], and was entirely out of sympathy with very unpleasant personal and other surroundings." The word *faticosa* used by Petrarch "evidently indicates that she took her part in the farm work." She did not die of the plague, as commonly supposed, but "a gentle death, resembling the languishment of a cut flower," due to uterine fibroma; her grave was marked by a few stones (*pochi sassi*). Mr. Mills finds it necessary to reject the entry in the Virgil as apocryphal, although M. Nolhac, the greatest expert in the matter of Petrarch's handwriting, accepts it as authentic beyond a peradventure.

We suspect that the critical discussions were only designed to introduce the drama, which really lay nearest the writer's heart, and in which he gives a very pleasant wandering account of Francesco and his long talks with his sweet, serious-minded *contadina*. The illustrations are beautifully executed.

THE UNIVERSITY OF CHICAGO PRESS

Studies in General Physiology (In two volumes)

By PROFESSOR JACQUES LOEB, now of the Department of Physiology at the University of California.

These two stately volumes will comprise 800 pages, with 162 illustrations and an adequate index. In them are summarized the brilliant results of the author's researches in the fundamental problems of life during the past twenty years; Professor Loeb's name will always be associated, for example, with the epoch-making discovery of 1899 of the method of artificial fertilization (parthenogenis) herein described.

The set in a neat box, $7.50 net, $7.90 postpaid

The Messianic Hope in the New Testament

By PROFESSOR SHAILER MATHEWS, of the Department of Theology at the University of Chicago.

The messianic hope of the Pharisees is formulated as a criterion for historical interpretation. With its aid a study is made of the messianic ideas of Jesus, the New Testament doctrine of judgment, and justification through faith; the messiahship of Jesus as the basis of the apostolic theodicy; the messianic age and its forerunner the gift of the Spirit; the resurrection of the body; the coming of the Kingdom; the "consummation." As a conclusion there is shown the distinction between the essential and the formal elements of historical Christianity made possible by such an investigation.

$2.00 net, $2.14 postpaid

The Progress *of* Hellenism in Alexander's Empire

By PROF. JOHN P. MAHAFFY, Sometime Professor of Ancient History at the University of Dublin.

The eminence, great learning, and literary reputation of the author assure the value and interest of this book. The spread of Greek Culture throughout the eastern and other portions of Alexander's empire forms the basis of the narrative, in which Professor Mahaffy has epitomized the influence of this culture upon the life of its own and succeeding times, especially upon Christianity. He has rendered valuable service to both student and more casual reader.

$1.00 net, $1.10 postpaid

Studies in Logical Theory

Edited by PROFESSOR JOHN DEWEY of Columbia University, New York City.

". . . It is my opinion that these 'Studies' in an effective way embody a view that is bound to have attention; they raise questions in philosophy that no student to-day can afford to neglect; and whatever one's own standpoint may be or whatever may prove true of the validity of their contentions, they make a book that cannot fail to be decidedly useful."—ALFRED H. LLOYD *of the University of Michigan.*

$2.50 net, $2.67 postpaid

Light Waves and Their Uses

By ALBERT A. MICHELSON, Head of the Department of Physics at the University of Chicago.

"The subject, while of great scientific interest, is presented in such simple form that comparatively little training is needed to enable one to comprehend the essential facts and fundamental principles involved. The three-colored plates are admirably executed."—*Scientific American.*

$2.00 net, $2.12 postpaid

Physical Chemistry in the Service *of* the Sciences

By JACOBUS H. VAN 'T HOFF, Professor at the University of Berlin.
English version by ALEXANDER SMITH, Professor at the University of Chicago.

"The volume before us is an unusually elegant one, which makes a strong appeal to the booklover as well as the chemist. From the fact, probably, that the lectures were originally given in English, this version reads more smoothly than does the German, and the former possesses a charm which one does not find in the latter."—*Journal of the American Chemical Society.*

$1.50 net, $1.60 postpaid

An Outline of a Bible-School Curriculum

By GEORGE W. PEASE, Professor of Pedagogy at the Hartford School of Religious Pedagogy.

". . . Its value lies in its application of an intelligent educational philosophy to a concrete and apparently practical scheme. Whoever has anything to do with the conduct of a Sunday school and has any ambition to increase its educational effectiveness ought to be acquainted with this book."—*The Outlook.*

$1.50 net, $1.66 postpaid

A History *of* Matrimonial Institutions (In three volumes)

By GEORGE E. HOWARD, Professor of Institutional History at the University of Nebraska.

". . . His work, based on the investigations of all accessible literature, historical, scientific, and legal, touches upon every problem involved in marriage and divorce, and its optimistic conclusions are quite in harmony with the true interpretation of evolutionary facts concerning the social development of mankind. It would be well if the extreme advocates of 'divorce reform' and the Mormonophobiacs could give it careful perusal. For even the general public Professor Howard's volumes cannot fail to be both interesting and instructive, for they deal attractively with the most human of all institutions, and contain a mass of facts nowhere else obtainable."—*The Nation.*

The three volumes in paper box, $10.00 net, $10.72 postpaid

Religion and the Higher Life

By WILLIAM R. HARPER, President of the University of Chicago.

"The book makes a valuable addition to an old theme. . . . It is a tonic, all the way through. Indeed, the whole book is to be recommended for its strong sense, its fine art of putting things, its rare incisiveness."—*Service.*

Memoirs of Henry Villard

Journalist and Financier

1835-1900

Two volumes, with Portraits and Maps.

$5.00 *net*. Postage, 35 cents.

An autobiographical record of the varied and romantic career of the war journalist who subsequently became a power in the financial world, and carried the Northern Pacific Railroad to completion. Full of incident and valuable for its reminiscences of Lincoln and other prominent men of the time, as well as for its descriptions of important battles of the Civil War.

"A book of extraordinary interest. It is written with great ability, in a clear and flowing style; it details with perfect candor the incidents of a great career; it is an admirable report of great events, all of which the writer saw, and a large part of which (after 1870) he was; it exhibits the rise and growth of a rich and powerful personality and a character at once remarkable for its simplicity and its variety."—JOHN WHITE CHADWICK, in the *New York Times* Saturday Review.

"This posthumous autobiography of the late Henry Villard is a work of exceptional interest."—*Commercial and Financial Chronicle*, November 12, 1904.

THE NEW MACMILLAN BOOKS

A BIOGRAPHY OF RARE INTEREST

Mr. Frederic Harrison's Chatham

WILLIAM PITT, first Earl of Chatham, was the man who made England preëminent in Europe in 1758. He was the strongest friend the American Colonies ever had. He must be ranked among the greatest of orators and wisest of statesmen, especially of war ministers. It was Frederic the Great who said, "England has suffered much to produce Mr. Pitt; but at last she has brought forth a man." *Cloth, 12mo, gilt top, $1.25 net (postage 9c.)*

OF UNUSUAL VALUE TO READERS OF HISTORY

Professor Lamprecht's What Is History

FIVE LECTURES ON THE MODERN SCIENCE OF HISTORY. By KARL LAMPRECHT, Ph.D., LL.D., Professor of History in the University of Leipzig. Translated from the German by E. A. ANDREWS. *Cloth, 12mo, $1.25 net (postage 9c.)*

These lectures include "Historical Development and Present Character of the Science of History," delivered at the World's Fair in St. Louis; also the addresses delivered last October in New York during the celebration of the founding of Columbia University. The "Problems of Universal History" are discussed in the final lecture of this valuable book.

OF INTEREST TO EVERY MUSIC LOVER

Dr. Hanchett's The Art of the Musician

A GUIDE TO THE INTELLIGENT APPRECIATION OF MUSIC. By HENRY G. HANCHETT. Illustrated with Musical Quotations. This book by the well-known pianist, teacher and lecturer, is calculated most of all to supply the demands of those mature lovers of music who wish to understand the aims and purposes of a composer, and to get some ground for a fair appreciation of his methods and their results. *Cloth, 12mo, gilt top, $1.50 net (postage 13c.)*

BEAUTIFULLY ILLUSTRATED IN COLORS

Florence—

Some Tuscan Cities, painted by Colonel R. C. GOFF. Described by CLARISSA GOFF. With seventy-three full-page plates reproduced in the colors of the original paintings. *Cloth, decorated cover, gilt tops, $6.00 net*

HELPFUL SUGGESTIONS FOR THE BLIND

Dr. Émile Javal's On Becoming Blind

Translated by CARROLL E. EDSON. This little book was written by the famous French oculist after he himself became totally blind. There is a world of sympathetic helpfulness about the discussion of what one who has lost or is losing his sight may still be encouraged to do for himself. The pathetic charm of its style has been retained to a high degree in Dr. Edson's translation which should become invaluable to oculists, family practitioners of medicine, or attendants on the blind.
Cloth, 16mo, $1.25 net (postage 10c.)

Mrs. Alfred Ely's Another Hardy Garden Book

gives simply the results of years of her own experiences in raising vegetables, flowers, fruits, transplanting trees, etc. The New York *Tribune* describes Mrs. Ely as "the wisest and most winning teacher of the fascinating art of gardening that we have met in modern print." With 49 full-page plates. *$1.75 net (postage 12c.)*

By the Same Author **A Woman's Hardy Garden**

Fully illustrated from photographs. Sixth Edition. Cloth, 12mo, gilt tops, $1.75 net (postage 13c.)

It was of this book that Mrs. ALICE MORSE EARLE wrote: "Let us sigh with gratitude and read the volume with delight."
—*Dial.*

Adams and Sumner's Labor Problems *A Text-Book*

By THOMAS SEWALL ADAMS, Ph.D., Assistant Professor of Political Economy, University of Wisconsin, and HELEN L. SUMNER, A.B. With full references for supplementary reading. *Cloth, $1.60 net (postage 13c.)*

Timely topics are discussed with what the *Globe-Democrat* calls "a splendid combination of thoroughness and brevity."

NEW NOVELS JUST READY

Mrs. Sara Andrew Shafer's Beyond Chance of Change

is another delightful book in the same vein as her "The Day Before Yesterday," which the Philadelphia *Ledger* describes as "half humorous, half tender, wholly delightful." *Cloth, $1.50*

Mr. Robert H. Fuller's *novel* The Golden Hope

is a tale of the time of Alexander the Great; a riot of color, adventure and romance, of which the Macedonian invasion of the Empire of Darius and the siege of Tyre are elements in the historic background. *Cloth, $1.50*

Mr. Eden Phillpotts's *powerful novel* The Secret Woman

"is beyond question one of the greatest novels in literature. It is a masterpiece. It sets Mr. Phillpotts among the immortals." JAMES DOUGLAS in *The Star* (London).

"It effectually lifts Mr. Phillpotts among the three or four novelists of the first rank to-day."—*Daily Mail* (London).

Second Edition. Cloth, $1.50

THE MACMILLAN COMPANY, Publishers, 66 Fifth Ave., New York

The Nation.

NEW YORK, THURSDAY, MARCH 9, 1905.

The Week.

When did the Monroe Doctrine begin forbidding us to permit European nations to collect their just dues from an American republic? Senator Platt of Connecticut takes it for granted that we are bound to refuse such permission; and then argues plaintively about the "injustice" of that position unless we proceed at once to collect and pay all those foreign claims ourselves. But who decided that we must refuse? Instead of refusing, we effusively acquiesced when Germany requested our assent two years ago in the similar case of Venezuela. What has happened to the immutable Monroe Doctrine since to work so great a change? The only answer to that question which we are likely to get is the one proffered by Prof. John B. Moore in his article in the current *Review of Reviews*. After recounting the joint intervention in the affairs of Hayti and San Domingo by England, France, and the United States in 1851, he remarks: "To-day, public opinion in the United States would be adverse to such a concert with European Powers on an American question." But where, we wonderingly ask, is the proof of that? Does any man know that, if the President had accepted, instead of declining, the invitation of European creditors to make common cause in San Domingo, "public opinion" would have condemned him? If there has been any expression of popular sentiment on that subject we should like to have some one point us to the record of it. It is certain that the Administration press would have admiringly exclaimed at the singular wisdom of Mr. Roosevelt if his decision had been precisely the opposite. An echo is not public opinion.

Secretary Hay is explicit and emphatic in assuring the Haytian Minister that this Government has no thought of annexing either Hayti or San Domingo. We have quite islands enough, thank you. Mr. Hay adds that we would not accept the two republics mentioned even if their citizens should throw themselves into our arms. This is timely and reassuring, if it speaks for the present honest intention of the Administration. The question remains, however, whether it is wise to take any step leading directly to that annexation which the Secretary asserts is contrary to both our interests and our sentiments. If we take over Dominican financial administration, is there not every likelihood that we shall find the land running with the purse? The Dominicans who want to be annexed and have done with it, might well say to Mr. Hay, with his calm proposal to assume control of their revenues:

> "You take my house when you do take the prop
> That doth sustain my house."

Hence we may fairly say that the Secretary's strong disclaimer of annexation is one argument more against ratifying the San Domingo treaty. The way to keep out of annexation schemes is to keep out of their beginnings.

President Roosevelt's appointment of a colored man to an important office in this city will put an end to the old Southern complaint that negroes are given Federal positions only in the former slave States. This has never really been a valid criticism, particularly since Mr. Roosevelt made Mr. W. H. Lewis, the old Harvard football player, an assistant United States District Attorney in Boston. Mr. Anderson, whose appointment as collector of internal revenue in this city is now announced, has been a loyal Republican worker and a trusty follower of the machine bosses. To that extent the appointment is open to criticism. But he is more than that, being a man of ability, of excellent education, with considerable reputation as an orator. If it is President Roosevelt's plan to reward the various elements which aided him to achieve his unprecedented victory, the negroes are certainly as much entitled to spoils as are the Irish editors who are getting consulships. But proper political recognition of their leaders will be an immense stimulus to the negroes everywhere, and an important factor in elevating them. The best way to make good citizens is to put some of the duties of citizenship upon those qualified to discharge them.

The House of Representatives has brought odium on itself by the attempted mileage grab, and all for nothing, since the Senate promptly threw out the objectionable item. But the roll-call in the House showed some interesting features. In the aye vote were 52 Republicans and 38 Democrats, which certainly leaves neither side in a position to make partisan use of the episode. There may, at the same time, be some little consolation in noting that a good majority of those members who have been re-elected, voted against the appropriation. It was, in fact, those who had failed of renomination or reëlection last fall who used their last hours of Congressional service in this mischief, and turned the scale against the self-respecting members. There were 36 men voting on this roll-call who would not reappear in the Fifty-ninth Congress, and all but seven of them voted for the mileage, Messrs. Baker and Douglas of this city being among the seven. In this whole matter it is to be remembered that the mileage was a very small matter to an Eastern Congressman, but a pretty important one to a member from any distant State. The Hawaiian delegate's mileage amounts to two-thirds of his entire salary. It is a peculiar coincidence, to say the least, that every member from the Pacific Coast States who voted at all—and only 5 out of the 13 failed to be recorded—voted in favor of the payment. Undoubtedly, it takes sterner stuff to refuse a gift of $1,200 than one of a paltry $25 or $50.

Commissioner Garfield's report that the Beef Trust has been making only about 2 per cent., and that some of the companies have temporarily operated at a loss, is naturally hailed with joy by the packers. "Here," they cry, "is proof positive that we lead the list of President Roosevelt's 'good' Trusts." On the other hand, the accounts presented by Mr. Garfield puzzle rather than enlighten the average man. The consumer who is paying such high prices for his meat, would like to know who are the expert accountants who went through the Trust books; he has a suspicion that even Government agents are not infallible. Then, too, he is well aware that bookkeeping conceals quite as often as it reveals the facts. A company may ostensibly be earning only 2 per cent., and yet high salaries, rentals paid to the inside clique, special charges for private cars, and other such operating expenses, may keep down the dividends, while the real owners of the enterprise enjoy comfortable profits. Indeed, the report admits that the annual profit on the private cars has ranged from 14 to 22 per cent. "These cruel doubts," the packers will reply, "are the fruit of ignorance." That may very well be, for men of finite intelligence are slow to grasp the great truth that the Beef Trust is a purely benevolent undertaking.

The municipal campaign in Chicago, in its first week, resulted in the practical obliteration of party lines. Both candidates for the Mayoralty, John M. Harlan, Republican, and Judge E. F. Dunne, Democratic, declare that the one overshadowing issue is the settlement of the city's traction problem. Both make an appeal for public ownership of the street railways, the difference between them being only that between a policy of restricting franchise grants with a view to ultimate municipal ownership, and a flat declaration in favor of immediate assumption of entire control

by the city. Mr. Harlan promises to submit every ordinance proposed to a referendum before it is placed upon its final passage through the City Council. In his speech of acceptance, Judge Dunne appealed directly to the radical element: "I think it lies in the power of the city of Chicago to blaze the way among American cities for putting into actual operation the principle of municipal ownership and operation of public utilities." He pointed to the success of Chicago's municipal light plant. In effect, the campaign promises to test the relative strength, not of the Republican and Democratic parties in that city, but of conservatives and radicals.

Senator Marks's resolution for a legislative investigation of the manner in which the surplus funds of our life insurance companies are employed was to have been expected. His statement that in all reports made to the Insurance Commissioner the surplus is intermingled with the general assets of the company in such a way that no outsider can tell how it has been invested or deposited or used, is but little exaggerated. Certainly, this information is generally denied to the average policy-holder who does not take the trouble to go to Albany and inspect the detailed reports filed with the Commissioner, and Senator Marks is perfectly justified in demanding a system of accounting which will give the policy-holder a true insight into the workings of his company. We are of the opinion that suggestions of legislative action will not stop here unless there are voluntary and radical changes in the management of some of our largest companies. The Equitable scandal has clouded the prospects of every insurance corporation in this country. More than two weeks have passed since the so-called Hyde victory, and what has happened? The president and subordinate officers who denounced the vice-president and demanded his removal have not resigned, and neither has Mr. Hyde. The conditions which Mr. Alexander pictured as intolerable have obviously become more so, if this were possible. The vice-president and chief shareholder, of whom Mr. Alexander said that it was unsafe to have him in charge of the company during the president's absence, is still in position to do harm in such an eventuality. No one has denied or retracted a single allegation. The public has no intimation whether Mr. Hyde's trouble is due to his youth, his great wealth, and his propensity for self-advertisement, or to some moral failing. The doubt is as cruel to Mr. Hyde as are, to Mr. Alexander, some of the stories afloat about him. They can be ended only by a wholesale house-cleaning.

There are now two unsuccessful candidates for the Presidency who have turned to the popular periodical as a means for the political regeneration of the country. Mr. Bryan has for years been editing what is practically a country weekly of the familiar type, with political attachments. Mr. Watson now enters the field with a ten-cent monthly. The Nebraska Democrat's utterances are followed by recipes for buckwheat cakes, question-and-answer columns, and humorous anecdotes. The Georgia Populist's doctrines are in a wrapper composed of fiction and poetry by the same writers, or of the same sorts, as those found in any one of the popular magazines. It is presumably the theory of both proprietors that without these miscellaneous features the political propaganda would fail to reach its maximum efficiency. But there is room for some nice speculation on this point. Do the 10-cent magazine readers present the most hopeful field in which to sow Populistic precepts? Might not Mr. Bryan make more converts if he added a serial by a popular novelist? It is already to be accepted as a rule that politicians who may in the future need an "organ" must keep out of the way of those whose claims have been before staked out. Thus, Mr. Swallow has the choice of a heavy quarterly or a comic weekly, while Mr. Debs might choose between an "outdoor" magazine and a review of the fashions.

Sectarian schools are giving trouble in Ottawa as well as at Washington. Sir Wilfrid Laurier's bill to maintain "separate" (that is, Catholic) schools in the new provinces of Saskatchewan and Alberta, to be created out of the Northwest Territories, has already brought him the loss of one member of his Cabinet, Clifford Sifton, and has raised a great outcry in Canada. Opposition is based partly on technical grounds of law, but more upon the injustice of fettering the new provinces with a school-law which, so declares a correspondent of the Toronto *Globe* who recently visited the Territories, is distasteful to the great majority of the settlers. Without passing on the merits of the question, we think it clearly unfortunate that religious animosities such as were shown in connection with the Manitoba school dispute ten years ago, should again be aroused. The issue is obviously troubling and dividing the Liberal party, though Sir Wilfrid's position will not be seriously menaced if the Conservatives, under the lead of Mr. Borden, persist in not making the matter a party question.

Again has the Irish question troubled the repose of English politics. Mr. Balfour has been compelled to throw to the Ulster wolves Mr. Wyndham, Chief Secretary for Ireland, who was in some respects the most brilliant and admired man in his Cabinet. If Wyndham could not be said to be the rising hope of stern and unbending Tories—since all the latter-day Tories seem to have apology written on their faces and to possess backbones with an extra supply of vertebræ—he was at least one whose personal qualities and public abilities were of a sort to make a veritable bow of promise seem to hang above his political future. But he now joins the portentous list of Mr. Balfour's losses—Lord George Hamilton, the Duke of Devonshire, Sir Michael Hicks-Beach, Sir John Gorst, Mr. Elliott, and now George Wyndham. The Chief Secretary's forced resignation, together with the debates and the bitter dissensions within the Conservative party leading up to it, has dealt Mr. Balfour's tottering Ministry a rude blow. It is not simply that the Premier is weakened by losing a valued colleague. The whole affair, as threshed out in the Commons, where, as Mr. Redmond truly said, the truth had to be dragged out of the Government piecemeal, has further and seriously discredited a Ministry already fallen into contempt.

Two weeks ago the row began. It centered about the Ministry's relations with Sir Antony MacDonnell, whom it had appointed Under-Secretary to the Lord Lieutenant of Ireland. Sir Antony was himself an Irishman, a Roman Catholic, and a Liberal, who took office with the avowed purpose of trying to do something to make English rule in Ireland more tolerable. With the knowledge of the Lord Lieutenant, and, as he supposed, with the authorization of the Chief Secretary, he entered into negotiations with certain Irish landlords and Nationalists. The result was the so-called Dunraven scheme, covering, among other projects, a certain amount of "devolution of Imperial powers"—the elegant Tory phrase for Home Rule. The plans were published in the newspapers, and created no sensation. But a month later the *Times* made a violent attack upon the proposals, and upon Mr. Wyndham for tolerating them. This was followed by the whole Ulster pack in full cry. Mr. Balfour took fright, called Mr. Wyndham to book, and thereupon an official statement was made that Sir Antony MacDonnell had exceeded his powers, and that the Cabinet had rebuked him for his "indefensible" conduct. Yet his resignation was not asked for, neither did he offer it. The reason was made clear as soon as Parliament convened. Sir Antony had in his possession letters which showed that all that he had done, he had done with the consent and apparent godspeed of his official superiors. It was the production of these letters in the Irish debate in Parliament that brought on the crisis.

The German Chancellor makes no

concealment of the fact that the new commercial treaties which he has lately concluded with Russia, Austria-Hungary, Italy, Switzerland, Belgium, Rumania, and Servia were drawn in the interests of the Agrarians. German industry and commerce, he explained in his speech of February 2, have progressed satisfactorily, to his mind, during the last ten years, but not so agriculture. Hence the duty of the State to come to its rescue. Speaking before the Council of the Agricultural Society a week later, he denied that the manufacturing interests would suffer, while maintaining that he had now relieved the farming interests of their worst troubles. In the main, the latter have been well pleased with their victory; even if it was not as extensive as they hoped, it at least once more establishes clearly their practical ownership of the Government. The Chancellor has had little difficulty in obtaining the Reichstag's approval for his treaties, despite the vigorous protests of the various Liberal parties, the low-tariff men, and the Social-Democrats against the greatly increased duties on grain, meat, and other foodstuffs—in some cases as high as 100 per cent. As is inevitably the case in the award of tariff favors, the spoils have gone to those who have been able to bring the greatest social and political pressure to bear. The workers in the fields are as unorganized in Germany as elsewhere, and subject to many disadvantages. Their employers still have the right to inflict corporal punishment upon them in certain portions of the Empire. Hence they must submit with a grimace to an increase of two marks per 100 kilograms on wheat, which now bears a total duty of 5.50 marks; of one mark and two-fifths on corn; or one and a half marks on rye, and of nearly three marks on flour. Let the theorists say what they will, this can only mean that the workingmen and every other class in the community must pay tribute to the land owners to the extent of millions of marks for the necessaries of life. Von Bülow was not far wrong when he assured his Agrarian hearers that "the time of your harvest has come."

Upon the United States all this has a very important bearing. Writing in the current *Atlantic*, Mr. William C. Dreher affirms that the indifference of the American Government to the serious situation which will exist after January 1, 1906, causes "much amazement" in Berlin. The German Government has not yet announced what it will do in regard to the United States. For the present, American imports will be taxed at the minimum rates of the old tariff. But, obviously, we cannot claim consideration under the "most-favored-nation" clause after the new treaties go into effect, since the seven contracting nations have made special concessions for their new rates. In the case of Cuba, England has just been unable to obtain the same rates as the United States, for precisely the same reason. A writer in the Berlin *Nation* finds the situation as dangerous for Germany as for the United States, and fears the early outbreak of a tariff war injurious to both countries. Most of our exports to Germany consist of raw materials or half-manufactured goods. In 1904 six million of dollars' worth of American wheat was consumed by Germany. There will be a rapid shrinkage in these and similar figures unless our Government bestirs itself. This gives peculiar significance to the Senate's resolution authorizing the Finance Committee to dig into the tariff during the recess.

After consulting with Francis Kossuth, Count Andrássy and other Hungarian leaders of the Opposition without being able to find a Premier, the Austrian Emperor decided to receive members of the "anti-Tisza coalition" in platoons. Sixteen of them were given audience successively at Vienna last week. Among them was Count Albert Apponyi, who had an article in the last *Monthly Review* explaining the Hungarian crisis, and confidently predicting that the Government would carry the recent election—which, of course, it utterly failed to do. Hence the present attempt to form a Ministry out of the somewhat heterogeneous Opposition. It, however, is absolutely united in standing for new measures of Hungarian autonomy, including the military demands, and at least some of these will have to be conceded if the Government is to be carried on under the forms of law. Kossuth, in an interview with the Vienna correspondent of the Paris *Temps*, after his reception by the Emperor, said that he thought matters could be "arranged"; but he meant, of course, that Francis Joseph would arrange them by making substantial concessions.

An article published in the *Century* on the Russian outlook contains an interview with M. Witte which has some pertinence in view of current events. Speaking in the week after the zemstvo conference—that is to say, at the close of last November—M. Witte reiterated his opinion set forth at the beginning of the war, regarding the grounds for expecting Russian victory:

> "I gave my opinion, officially, that if we should succeed, in the end, in defeating the Japanese, it would be by virtue of our superior finances. The Japanese cannot resist our finances. I have nothing to say of the two other factors—the army and the navy. Perhaps the Japanese can carry on the war one and a half, two—at the most two and a half-years. Considering the finances alone, we can keep it up for four years. Other factors being left out of account, the Japanese can therefore be brought to sue for peace by their financial ruin."

This view of the situation will be recognized as that which from the start has shaped the policy of financial Paris towards the Russian loans, and has largely influenced London's reception of the Japanese borrowings. On no other theory than a misgiving as to Japan's "staying power," military or financial, can the harsh terms exacted from Japan by the lending bankers for the $110,000,000 provided last year in the loans of May and November, be explained. But M. Witte's reiteration of his prophecy, under the subsequently changed conditions, is interesting.

Vacillation and the extreme of timidity mark the two documents issued by the Czar on Friday. First came his manifesto, asserting the autocratic principle with melancholy fanaticism. A statement more depressing, more inept, it would be hard to find in all the annals of royal blundering. But close upon its heels came the Czar's rescript promising the speedy institution of representative assemblies in Russia. Obviously, if Nicholas is sincere, his rescript eats up his manifesto. But he seems like a man distraught, and to be of the mind of the last counsellor who gets his ear. First we have Pobiedonostseff, summoning him to shake himself and go out like the Russian autocrats of other days. So the nerveless Czar essays that rôle. Then comes Witte, assuring him that this will never do, and urging him to listen to the appeals and rising demands of the best men in Russia. Thereupon the hapless and helpless Czar swings in that direction. The personal impression he makes throughout is that of one wholly unequal to the too vast orb of his fate. Liberty, however, thrives upon the follies and weaknesses of those who would stay its course, and from the vague and reluctant concessions which Nicholas, torn with doubts and fears, is proposing, may yet be built up a Russian Parliament. Details are still wanting. Probably the Czar and his counsellors do not themselves know exactly what they want or intend. But the thing is that the people are in the way to utter their authoritative voice. Once assembled, the spokesmen of the people cannot be silenced or dispersed. They will acquire strength as they go on. Hence we may be confident that, with whatever delays or temporary backsets, we are witnessing the passing of the old order in Russia.

We may also, but this is less certain, be witnessing the close of hostilities in the Far East as a consequence of the Titanic battle which has been raging for ten days, on the Japanese initiative, for the occupation of Mukden and the capture of Kuropatkin's army. We go to press with no satisfactory grounds for prediction one way or the other. The losses have already been enormous.

THE REAL FACTS ABOUT ARBITRATION.

Senator Lodge's defence of the Senate as the sworn friend of arbitration leaves some holes in the ballad. His list printed in the *Congressional Record* shows that the Senate has ratified 43 arbitration treaties since the foundation of the Government, while 7 arbitrations have been effected without referring the agreements to the Senate. But this does not sustain the Senate's contention that its amendment of the treaties recently submitted to it was not a blow to the principle of international arbitration. With the latter, cases of specific arbitration for specific disputes running back as far as 1802 have really little to do.

Until within the past fifteen years, general international arbitration was hardly more than a hope, which had never been given concrete form by any action of the Government. When the Senate of Massachusetts resolved in 1832 that "some mode should be established for the amicable and final adjustment of all international disputes, instead of resort to war," it gave expression to an aspiration which, nineteen years later (1851), found expression in a resolution introduced in the United States Senate, reciting that it would be desirable for this Government "to secure in its treaties with other nations a provision for referring to the decision of umpires all future misunderstandings that cannot be satisfactorily adjusted by amicable negotiations." True, the Senate never acted on the resolution. Two years later another resolution came before that body, and into its pigeonholes, advising the President "to secure . . . a stipulation in all treaties . . . providing for the adjustment of any misunderstanding or controversy which may arise . . . by referring the same to the decision of disinterested and impartial arbitrators." In 1872 Charles Sumner introduced resolutions recommending "the adoption of arbitration as a just and practical method for the determination of international differences, to be maintained sincerely and in good faith, so that war may cease to be regarded as a proper form of trial between nations." In 1888 Senator Sherman presented a resolution requesting the President "to invite . . . negotiations with any government with which the United States has or may have diplomatic relations, to the end that any differences or disputes arising between the two governments which cannot be adjusted by diplomatic agency, may be referred to arbitration and be peaceably adjusted by such means."

Plainly, all these expressions aimed at one goal—a general and permanent system of international arbitration, to be effected by general treaties, and to work as nearly as possible automatically when international disputes should arise. The public sentiment which prompted the resolutions had that object in view, and it would be absurd to maintain that it had no other purpose than to obtain piecemeal treaties to be made when each dispute arose, and halt its settlement at the doors of the Senate—to make arbitration an uncertainty in every case, since its acceptance in every case must depend upon the changing moods of a body whose actions are controlled by a hundred varying motives, many of which are wholly irrelevant to the merits of the questions actually before it. It would be still more absurd to contend that those who have been striving for many years to obtain international arbitration, have desired to secure action by which it would be impossible in the future to settle even minor difficulties as they have often been settled in the past, by arbitration mutually agreed upon without the formality of consulting the Senate. Prof. John B. Moore's standard work shows that there have been at least twelve such arbitrations, instead of the seven given in Senator Lodge's list.

What the friends of arbitration have desired was shown in the plan of arbitration recommended by the International American Conference in 1890, the first article of which provided for the adoption of "arbitration as a principle of American international law for the settlement of differences . . . that may arise"; and the second article of which made arbitration obligatory.

The first material success crowning the movement came in 1890, when the Senate and House passed the following concurrent resolution:

> "Resolved, etc., That the President be and is hereby requested to invite from time to time, as fit occasions may arise, negotiations with any Government with which the United States has or may have diplomatic relations, to the end that any differences or disputes arising between the two Governments which cannot be adjusted by diplomatic agency may be referred to arbitration, and be peaceably settled by such means."

In the light of this pronouncement, the position which the Senate must defend is not its attitude towards single cases of arbitration submitted to it in the past, but its attitude towards the principle of general and effective arbitration since 1890, when Congress for the first time declared for it. Because of that declaration, Mr. Olney and Lord Salisbury negotiated the treaty providing for arbitration of future disputes between the United States and Great Britain, and although the enlightened public opinion of the whole English-speaking race enthusiastically favored the ratification of this measure, the Senate killed it without compassion. It is true that the Senate ratified the Hague convention, but if its recent attempt to amend the ten treaties which are now things of the past had been successful, much of the force of the Hague convention would have been lost. Resort to the peace tribunal would have been possible only after a separate treaty for each dispute had been ratified by the Senate. To say nothing of the clumsy machinery and delay entailed by this method, it would have been attended in every case by so much uncertainty in the result that the Secretary of State would have felt little enthusiasm in employing it.

Our foreign negotiations, in fact, come for review before a body of men who have no individual international accountability, and incur little individual odium when an arbitration negotiation fails. From such odium, however, the Senate as a body cannot escape by exhibiting a list showing how many times it has agreed to single arbitrations; for the important fact stands out that to the great cause of general international arbitration it has dealt a mighty blow.

ROOSEVELT ON SENATORS.

Many stories, apocryphal or well-founded, have been told of President Roosevelt's private quips and gibes at the expense of Senators, individually and collectively. It is known that his tongue runs away with him oftener than his horse; and some of his smart sayings, as well as sayings that cause others to smart, have no doubt reached august Senatorial ears. It is even said that it is partly the Senate's sense of spurned beauty which has led to its present somewhat strained relations with the Executive.

These tidbits of Washington gossip it is not for us to retail; but last week at Jefferson City, Missouri, some public testimony was given respecting the President's Senatorial standards. The Republican national committeeman from Missouri, Mr. Akins, had been at the White House sounding Mr. Roosevelt in respect to the Missouri Senatorial deadlock, and brought back positive information concerning the President's wishes. "The Administration did not want R. C. Kerens elected United States Senator," the reporter testified before the investigating committee. This was in line with evidence previously given under oath by Congressman Arthur P. Murphy of the Sixteenth District of Missouri. He said that he had been directly informed by Mr. Akins that "if any newly elected Congressman in Missouri expected to have any influence in the distribution of patronage in our districts, he must line up against R. C. Kerens." That is conclusive proof of Presidential hostility.

Nor did the President stop with his highly commendable opposition to Kerens. He proceeded, with great frankness, and in the spirit of Sainte-Beuve's remark that an example is always the best definition, to define the type of man he wanted by specifying the individual Senators whose doubles he did not desire to have undo him. "The President did not want any more like

Elkins, Kearns of Utah, or Clark of Montana in the Senate. He was having more trouble with them now than with the rest of the Senate, and he did not want any large railroad corporation interested in a United States Senator." Thus we have, in addition to the Constitution on the qualifications of a Senator, and supplementing what Hamilton and Madison and Story wrote on that subject, the opinion of President Roosevelt on the type of man who should *not* be a Senator.

One observes at a glance that the severe application of this Presidential standard—this Roosevelt's Purge, as it might be called—would empty seats in the Senate faster than legal indictment has thus far been able to do. No railroad corporation to be "interested" in a Senator? That it would mean decimation! Off would roll the heads of both Senators from Pennsylvania and both from New Jersey, while "the frost that binds so dear a head" as that of the junior Senator from New York would soon be a subject of lamentation by our Shelleys of politics. Aldrich, too, would never come back from Europe; and as for the whole row of railroad Senators from the Northwest, they would speedily become extinct volcanoes. Kearns is to leave the Senate on account of lack of appreciation at home; Clark is a Democrat (or says he is), and may safely be held up as a horrible example; but Elkins, the Senator who has oftenest taken sweet counsel with the President on railway regulation—who gave his name to the compromise legislation with which Mr. Roosevelt was so pleased two years ago—who has served so often as prime illustration of the President's tact and skill in making even wicked Senators further the public good—what did Elkins think when he found his name leading all the rest in President Roosevelt's Index Expurgatorius?

Some may object that the President's scruples wear a belated air. It may be said that his deeds have not squared with his words—not even his words at one time with those at another. The author of the effusive telegram about his "loyal friend" Quay must look odd drawing the line at any sort of political roguery. For that matter, the President's comically premature letter of congratulation to Niedringhaus, on the supposed certainty of his election as Senator from Missouri, can but impair the force of anything he may say about elevation and purity of character in the Senate. To felicitate one of the most brazenly mercenary figures that have appeared in our politics, was a bad preparation for protesting against Kerens, Elkins, or anybody else. Of countenance given to an Addicks, we need say nothing.

Yet we would not rob Mr. Roosevelt of a particle of the credit which he deserves for lifting up his voice in behalf of an abler and better Senate. It is not merely that its present composition gives the President "trouble," it gives us all trouble; hinders the dispatch of the public business; sets a bad example to aspiring young men; reverses our political tradition. The steady increase in the number of rich nobodies in the Senate points to and is a product of the decay of our old ideals, and the beginnings at least of political rottenness. It is one thing to say that the Senate ought adequately to represent and safeguard property, but another to have it come about that itself should be a form of property. We may agree with Story that Senators should be "beyond the reach of the sudden impulses of domestic factions"; but that is not to approve the type of Senators whom none but their owners, the great corporations, can "reach" at all. We know that Senators of the older sort look with apprehension upon their invasion by men who bear, not a brain, but a purse. It throws too great a burden upon the diminishing number of members who are competent; it lessens the respect due to the office of Senator. How can you respect a man whose credentials as Senator are in the form of a certified check? The President is right. The Senate needs an infusion of men instead of moneybags. And if we can now and then send a man there whose speech, not his plate, shall be golden; who is able to give the signal to parties, and watchwords to debate; who will be a model and inspiration to generous youth by showing how far character and unbought abilities may still go in this country, we shall be helping to save an institution now obviously threatened with an embarrassment of rich men in corporation leading-strings.

MRS. STANFORD AND THE UNIVERSITY.

The death of Mrs. Leland Stanford will not, according to the statement of President David Starr Jordan, immediately affect the fortunes or policy of the University. The affairs of the institution, he adds, have for some time been managed by a board of trustees who are in entire sympathy with Mrs. Stanford's wishes. Without questioning the accuracy of President Jordan's utterance, we may note that the University has reached a stage where certain changes are inevitable; and the death of Mrs. Stanford, if it does not hasten, will at least not check them. Senator and Mrs. Stanford were ambitious to found one of the greatest universities in the world, and they have already succeeded in making it the richest in America. But the trustees cannot carry out the noble purpose of the founders without exercising large discretion. The knowledge and the experience which must guide them in 1910 and 1950, are obviously not the wisdom and experience upon which Senator Stanford could act in 1890 or Mrs. Stanford in 1900 and 1905. This fact she herself recognized in the broad terms of her gift.

In the moment of her tragic death people naturally recall her passionate interest in this University, and the devotion and self-sacrifice by which she sustained it in the perilous crisis while the Stanford estate was in litigation. Both she and her husband had limited advantages in youth, but upon their only son they showered those opportunities the lack of which they themselves felt so keenly. When this attractive and promising lad died at the age of seventeen, his disconsolate parents resolved to bestow freely upon the children of the State where they had gained their wealth, and upon others as well, that higher education which they had planned for their own son. This was the spirit in which the first stone was laid at Palo Alto. At the death of Senator Stanford in 1893 his estate was tied up by litigation, and the University fell upon evil days. The hard times made the raising of money upon any terms difficult. Mrs. Stanford received from the court an allowance of $10,000 a month for personal expenses—a modest sum for the style of living to which she was accustomed. She said, however, that she had known poverty, and that she would live on $100 a month in a room or two of one of her mansions, and give the rest of the money to the University. Her fine example inspired president, professors, and students. The teachers accepted heavy cuts in their salaries; all running expenses were reduced to a minimum, and the University —in spite of gloomy predictions—kept open. It was not until the suits were decided in favor of the Stanford estate and the financial stress was over, that the University encountered its worst troubles.

Deeply concerned as Mrs. Stanford was in the welfare of the University, she watched closely the details of administration. In theory she well understood the danger of meddling, and doubtless she earnestly tried to keep well within her legitimate sphere. But when, in 1900, Prof. E. A. Ross of the department of sociology was guilty of believing in free silver, she had not sufficient breadth of view and patience to tolerate him. The case was complicated by the fact that his views on Chinese immigration were diametrically opposed to those of the late Senator Stanford, whom she had almost canonized; and doubtless Professor Ross exhibited other traits which led her to put a low estimate on his attainments and character. At any rate, she failed—and the failure was perhaps natural—to understand that, in a university devoted to the free inquiry after truth, certain unorthodoxies of opinion, perhaps even vagaries, must temporarily be endured. She may have felt too old to wait the certain de-

feat of error in the course of a few decades. Thus it came about that Professor Ross was dismissed. Several of his colleagues took up the fight in his behalf and within a year followed him out. Others have since left, as opportunity has offered, and the Faculty has never recovered its prestige.

The attitude of President Jordan in this emergency has been sharply criticised. His motives were clear enough. He felt that Mrs. Stanford had done everything for the University, and that he should accede to her wishes in every way possible. He is not a man who lacks courage, as is proved by his bold advocacy of anti-imperialism in the teeth of public sentiment on the Pacific Coast. Yet he consented to the dismissal of a man whom he had described as a good teacher; for the sake of holding the University together, as he believed, he sacrificed an important principle. Some of his warmest admirers admit that in that difficult situation he blundered, and, perhaps through a feeling of chivalry towards Mrs. Stanford, allowed himself to be driven into an untenable position. However that may be, his own large view and his generosity of temper, combined with other high intellectual and moral qualities, have won back respect and even affection from men who were once hostile. He seems now secure in the confidence of the community.

In the last few years an undue proportion of the income of Stanford has been spent on building. Mrs. Stanford was anxious to see with her own eyes the outward and visible form of the university she was creating. Therefore she pushed the construction of laboratories and halls beyond immediate necessities, and cared less for strengthening the Faculty. But the work in brick and mortar is now nearly done; and, had she lived, President Jordan would soon have had more money for vital needs. He can now offer high salaries to the best teachers in the world, and he can assure them that Stanford will be second to none in standing for intellectual freedom. The people of the Pacific Coast have in some respects higher ideals of education than those of the Middle West. The Californians are planning magnificently for the State University at Berkeley. They already see that the two institutions, no matter how large the resources of each, can supplement and help each other both by coöperation and by wholesome rivalry. They are aware that years as well as money go into the making of a school. They have the money, and they have eternity.

AN EDUCATIONAL ENTENTE.

The philosophical faculty of the University of Berlin announces officially that graduate work done in any one of the fifteen institutions comprised within the Association of American Universities shall henceforth be accepted as equivalent to work achieved in residence at a German university. The only restriction made upon candidacy for the degree of doctor of philosophy is that at least three semesters shall be kept in actual residence at a German university; the remainder of the normal period of three years, or six semesters, however, may be taken in one or more of the American universities specified.

This action, it need scarcely be pointed out, is not only a singularly definite recognition from a conservative source of the worth of graduate instruction in our universities, but is also important for its bearings on the higher education in both countries. Henceforth, for instance, the German student of sociology and economics who is desirous of hearing American authorities on these subjects, and of observing American conditions upon the spot, can matriculate at an American university for a longer or a shorter period, as he may choose, without loss of academic status at home. With the continually increasing interest in matters American in Germany, it is probable that students who later on are to enter the public service, or are destined to fill professorial chairs in gymnasium or university, will be eager to avail themselves of so excellent an opportunity to acquire an expert knowledge hitherto obtained only at considerable inconvenience. The presence of German students of this kind in our lecture rooms would have, too, in conceivable cases, a tonic effect which surely would not be detrimental to the quality of our graduate courses.

For the American student the advantages accruing through the new arrangement are not particularly new; most of them he has had, to all intents and purposes, before. The gain in this direction is rather to the cause of graduate instruction in America than to the individual American student on his *Wanderjahr*. A concomitant action of the Berlin faculty is that the bachelor's degree of any American institution will hereafter be accepted at matriculation as equivalent to the *testimonium maturitatis* of the gymnasium or the Oberrealschule. Although this is a sweeping and somewhat uncritical action—since the greater universities in America by no means accept the bachelor's degree of all American colleges as the unquestioned basis for matriculation for the higher degrees—it is in the right direction. At the present time, in many German universities, it is perfectly possible for an American to matriculate on so unacademic a certificate as his passport, or even on no certificate at all, and thus to become a qualified candidate for the doctor's degree without having had any previous academic training whatever. This latitude has, it is needless to say, worked against high standards in American institutions, by making it possible for a student readily to secure abroad a standing denied him at home. What has probably not been suspected in Germany itself, but is none the less true, is that such laxness has tended steadily to depreciate the value of the German doctorate in America. That degree is felt, in our academic circles at least, to demand a careful scrutiny as to its inherent value in every individual case. Thus this reform of the procedure of matriculation at Berlin at once brings it conveniently into line with our American practice, and tends to rehabilitate the German doctorate as an article of exportation.

The establishment of a minimum period of three semesters of actual residence in Germany safeguards the degree from the German point of view, but it is at the same time a certain concession to the intending doctor, since, although it has been nominally possible for the American student to complete requirements for the degree at the end of that period of study in most universities, the actual promotion has often been grudgingly conceded.

In connection with the recent suggestion by the German Emperor that a system of interchange be set up between the members of the corps of instruction of the German and the American universities, this even more definite action of the greatest of the German universities in the direction of educational reciprocity is significant of an old order changing. The dictatorship in education, so long assumed, and rightly assumed, to be held by Germany, has at last made way for a still broader and more liberal construction of that *Lehrfreiheit* and *Lernfreiheit* which has made German university instruction an ideal for the world. That this *entente cordiale* has proceeded in our particular direction and on German initiative is proof positive, so far as expert opinion can give it, that the storm and stress which has evolved in the last two decades a real university system in America out of the chaos that preceded it, has not been in vain. What the University of Berlin has thus begun, it should not be difficult for the other German universities in their turn to carry out. The new system of international interchange, as well of the student who teaches as of the student who is taught, will, when properly adjusted, not only add in its way a new element of value to academic education, both here and yonder, but will inevitably prove a long step toward that unification of the highest education which, whatever its environment and however different its details, should make it essentially the same in spirit and effect in all the progressive nations.

THE PSYCHOLOGY OF ADMIRATION.

Many an artist who has noticed the excited state of the public mind about

a certain statue of Aphrodite now on exhibition in this city—who has, perhaps, seen the throng of hushed worshippers at her shrine and heard their whispered awe and delight—must have wondered what would be the fate of this same figure if, without its stains and breaks, it were exhibited at the Academy or the Society of American Artists as the work of Brown, Jones, or Robinson. Perhaps he can see no great artistic merit in the statue himself, and declines, as most artists do, to interest himself greatly in the question whether or not it is "an antique," knowing that there are bad antiques as well as good ones, and that a weak imitation of a great original is no better for being two thousand years old. Even though it be as lacking in exquisiteness as he finds it, it has yet, certainly, some degree of beauty—the degree of beauty, if no more, that is inseparable from anything approaching a competent copy, ancient or modern, of a noble and accepted type. The question is, whether the people who are daily in ecstasies before it are admiring the beauty which is really there or that which they think must be there. Here is what our artist's trained sense of quality, which admits of no argument or explanation, pronounces at once an inferior variant of the Venus de' Medici, itself a reflective work of a poor and late time; yet because its owner, backed by the critic of an influential journal, dares to pronounce the name of Praxiteles, travelled men and women who have beheld the Medici herself without a thrill, are filled with æsthetic emotion; and art students who have considered the Ilissus and the Hermes tiresome things that must be drawn before one can get at the life, are beset with anxious questionings.

The little gallery of a New York club is changed, for the time, into something like the Sistine room at Dresden by a public that would hardly glance in passing at the finest of modern statues, while it hurried on to admire a landscape or a portrait by Sargent. Suppose, even, that this figure were by Praxiteles, and as much finer than any of the countless Greek figures of its type as it should be, being the original of them all, would a public profoundly ignorant of sculpture really care for it? How many people spend much time over the casts in the Metropolitan Museum? Or, granting the advantage of marble over plaster in sensuousness of surface, how many people, even when professedly travelling for culture, spend much time in the sculpture rooms of the British Museum or the Louvre? And would not a public capable of any real enjoyment of the beauty of workmanship of a Praxiteles find something also to enjoy, though not so highly, in the best modern work?

Our artist would be likely enough to conclude that the enthusiasm he hears expressed is mere pretence, and altogether assumed; but probably he would be wrong. Doubtless there are some who know, vaguely, that Praxiteles was a very great sculptor, and who think that if this should really be his work, it would be unpardonable not to have admired it. There may be others who think everything Greek equally admirable, having no conception that there were variations in style and value in the work of six or eight centuries; and these, too, may think it a duty to express admiration, whether or not they feel it. But it is probable that few are conscious hypocrites; the most are influenced by external pressure, and really think they feel the raptures they express. It is hard for the best of us, even those who have some actual knowledge as a basis of independent opinion, to react against authority and to protest boldly that an admired work is but mediocre. The world is full of proclaimed masterpieces which hold their rank partly because no one is strong enough to resist the universal affirmation of their merit. We are all a part of the crowd, and it was only the child, in the old story, who saw that the King had nothing on. With most of us it is merely a question of the weight of authority which is needed to overthrow our private judgment. If we are modest, doubtful of ourselves, willing to admire and glad to find that we can, the authority need not be great. We are open to suggestion, and almost any one may make the needful passes. Also, we affect each other, and each admires, quite genuinely, because the others do.

Does any one suppose that many of the visitors to the Dresden Gallery appreciate the higher qualities of the Sistine Madonna? But they are in a receptive condition: they wish to admire, and the admiration comes. And when one is in this state of mind there is always something in a work of art that one can thoroughly like and be truly interested in, whether the work of art be a masterpiece or a very ordinary thing. One may, perhaps, be interested in what a picture represents rather than in what it is, and care to think that it is a portrait of Beatrice Cenci, attributing to the artist the emotions roused by a contemplation of the subject. Portrait shows are always entertaining; and though the average New Yorker may know little of Phryne, he knows that she was, somehow, a celebrated person, and the fact that a statue is called her likeness gives it for him a human interest that he can hardly be blamed for confusing with its artistic interest. One may, in the case of the Sistine, know nothing of masterful composition or purity of line, yet be sensible of well-cut features and a sweet expression. One may, in the case of the Aphrodite, catch the far-away echo of Greek beauty, and perceive a graceful figure and a prettiness of type not very different from that common to the cheaper forms of art in all ages. One has been made to look, one finds something—no matter what—that one can like, and one goes away rejoicing. One has "acquired merit," and the process has not been disagreeable. One has really liked something that it is proper to like, and feels a satisfying glow of virtue.

If the statue were by Brown or Jones or Robinson, it is probable that we should not look. There are many statues, and we cannot give them all the attention necessary to discover in them even such elements of attractiveness as we are capable of appreciating. That we do not look, does not prove that the beauty is not there, or that we are insincere in our praise of the beauty we have been made to look at. Let some one who has the ear of the public—some one whose authority it is inclined to accept—proclaim loudly enough that Brown, Jones, or Robinson is the greatest sculptor of all time, and that his Aphrodite is an immortal masterpiece, and we shall all look, we shall all see, and we shall all feel that we have become capable of appreciating the highest beauties of art. It is for this reason that an artist usually succeeds in commanding the attention and the praise of the public only when his work has ceased to be what it once was, and that we hail in the works of his old age the merit which we ignored when he possessed it.

A MUSICAL CENTENARIAN.

On the seventeenth of this month London expects to witness a unique ceremony. The musical and medical world will then unite in celebrating the one-hundredth birthday of Manuel Garcia, the inventor of the laryngoscope, the son of a famous tenor, the brother of two of the greatest singers of all time—Maria Malibran and Pauline Viardot—the teacher of Jenny Lind, and one of the greatest experts in the art of song known to the history of music; altogether, perhaps, with the exception of Sarasate, the most important musical genius Spain has yet given birth to. As a matter of course, the Spanish Ambassador will attend to congratulate the illustrious centenarian in the name of the Government of his native country. Addresses will be presented by delegates of German, French, Dutch, Belgian, American, Australian—even Japanese—laryngological societies, by musical societies, by old pupils of Garcia, and by the Royal Society, before which he read his paper, entitled "Physiological Observations on the Human Voice," just fifty years ago. The meeting is to conclude with the presentation to Mr. Garcia of his portrait painted by Mr. John Sargent, and in the evening there will be a

dinner at which a speech is expected from the centenarian, who is still fairly vigorous in body, while his mental powers are said to be absolutely undimmed by age.

Some surprise may be felt that the congratulatory meeting should be held in a medical instead of a musical building—the rooms of the Royal Medico-Chirurgical Society; but there is a reason for this. However much Garcia may have done for the tone art in training pupils, his discovery of the laryngoscope did infinitely more for the healing art by creating an entirely new branch of it, immensely facilitating the diagnosis and cure of throat troubles by enabling physicians to look down into the windpipe. It was a mere accident that led to Garcia's discovery—his finding, in the shop of a Parisian instrument-maker, a little mirror attached to a long stick, with which it occurred to him to try to see his vocal cords in action with the aid of a ray of sunlight. This led him to endeavor to place the art of voice-building on a scientific, physiological basis, to explain tone-formation, registers, and tone colors, or modulations of the voice. His first communication of his ideas to the world, in the lecture before the Royal Society already referred to, attracted little attention; and it was not until the quarrel of Türck and Czermak, some years later, regarding the invention of the laryngoscope, attracted general attention to the subject, that the real inventor was brought to the fore. In 1861 the Paris Academy of Science divided the Monthyon prize between Türck and Czermak; but the impending festivities in London indicate that the laryngologists the world over now know to whom honor is due, and are eager to shake hands with the creator of their science.

Garcia himself, in later years, abandoned the idea that laryngology, with its anatomical and physiological details, was of much use as a basis for the science of voice building. He fell back on the ear as the controlling factor, and followed the maxim that the secret of learning to sing lies in having a good example and trying to imitate it. He himself was a tenor of some note in his youth. He was taken to America at twenty by his father, who brought over a sort of family opera company, with which he succeeded, in a few years, in accumulating a fortune of $30,000. But on the way home from Mexico the party was stopped by brigands, who not only took all his gains from Garcia, but added insult to injury by making him sing for them. Subsequently, the son conceived an aversion to stage life, and for some years served on shipboard as a common sailor. Then he began his life work as teacher, first in Paris, afterwards in London, where he was appointed professor at the Royal Academy of Music. He continued to teach regularly until a few years ago; indeed, it is said that even now he gives an occasional lesson at his villa in Cricklewood.

If Manuel Garcia is given to musing, he must often think of the changes that have taken place in the musical world during the hundred years of his life. When he was born, Haydn was still four years from the end of his life, and Beethoven had written but three of his nine symphonies. Had Schubert lived as long as Garcia has, he would have died but eight years ago instead of seventy-seven. Wagner was born eight years after Garcia, lived to within a few months of seventy years, and died twenty-two years ago, while Garcia lives on! Chopin, Schumann, Mendelssohn, Liszt, Franz, Brahms, Rubinstein, and many other eminent musicians, most of whom reached what is usually considered a good old age, had not yet seen the light when Garcia was born. Of all the branches of music, the oratorio alone had reached its highest development before his birth. The symphony, the pianoforte piece, chamber music, the opera, and the art song, were all destined to come to maturity in his lifetime. Particularly great has been the progress, during Garcia's century, in the realm of song with which he himself has been so closely associated. Although Hadyn, Mozart, and Gluck had written a few pretty *Lieder*, the art song, as a form of equal importance with the other branches of music, remained to be created by Schubert. In the opera, more weighty things had been done, especially by Mozart and Gluck. Beethoven's "Fidelio" was born in the same year as Garcia, and he was eighteen when Weber's "Euryanthe" was launched—the forerunner of Wagner's operas, the first performance of all of which Garcia might have attended. But it is more startling to recall the fact that he might have done the same with all the operas of Rossini, who was born only thirteen years before him.

With the exception of the Bachs, who were noted musicians for six generations, and the Viennese branch of the Strauss dynasty, there is perhaps no musical family that affords a more interesting illustration of heredity in a special talent than the Garcias. The elder Garcia, who was born in 1775, was not only a great tenor and teacher, but a prolific composer of operas. His two famous daughters also became composer, as well as singers. Mme. Viardot (who is still living) was so lucky as to be able to base her operettas on librettos written by Turgeneff. Liszt said of her that "in all that concerns method and execution, feeling and expression, it would be hard to find a name worthy to be mentioned with that of Malibran's sister," and Wagner was amazed and delighted when she sang the Isolde music in a whole act of his "Tristan" at sight. The other sister, Mme. Malibran, belonged to an earlier phase of the era of song. While a first-rate vocalist, she indulged in practices—such as "improvising passages of strange audacity upon the stage"—which are not countenanced by modern taste.

EL TRIBUNAL DE AGUAS.—II.

But let us attend an ordinary session. At half-past eleven on Thursday morning (June 9), the immediate neighborhood of the ornate Puerta de los Apostoles—one of the three entrances to the Cathedral of Valencia—shows signs of more than usual animation in a rapidly gathering crowd made up of peasants in homely garb, townspeople of the middle class, numerous *badauds*, and only three foreign tourists. Thursday, we are told, is the old Moorish market-day, and has been devoted ever since the original foundation of the court by an early Moorish ruler to the regulating of these irrigation cases; nominally, the hour is eleven. On one side of the portal, a singularly incongruous modern sofa, straightbacked, with gaudy brocatelle covering, is intended to serve as the bench from which the decisions are given. A small semicircular enclosure, made with a light movable iron railing, prevents outsiders from crowding in on the trial. As we approach, some one says, "Extranjeros!" upon which a lane is immediately formed in order to allow the foreigners to take a front place, leaning on the balustrade; while, as I begin jotting down a few notes, another says, "Publicista!" when at once the peasant next me offers to explain or translate. "For," he adds, "most of the proceedings are in Valencian dialect, and the Señor probably understands only Castilian." It is always thus in Southern Spain when one has to do with ordinary unofficial persons; there is not only a charming readiness in answering questions, but a large-hearted spontaneity in offering practical assistance of the most useful kind—as indeed it turned out to be on this occasion.

At this time of day, the space in front of the church door is in shadow, permitting the crowd to wait patiently for the appearance of the judges, and to discuss freely the probable decisions, since all the peasants present know the circumstances of each case and are familiar with the elementary procedure of the popular court. Punctually as the Miguelete-tower strikes the minute with its booming bell, five men suddenly appear and take their places silently on the sofa. All are clad in Sunday black, clean, dignified, but without the least appearance of self-consciousness or pompous authority; they are all there for the settling of practical business claims, and, while conforming to convention or custom, have no idea of exalting their office or playing a set part. This, by the way, is another feature of Spanish social life in this region—the entire absence of pose, so long as the onlooker offers no challenge to the status, the character, or the efficiency of the person attending to a specific charge.

Here, then, are these five; and contrasting types they are. Three of them are but simple peasants of the most ordinary sort, *ouvriers endimanchés*, whose function subsequently appears to be to give assent to the

judgments pronounced. In the middle, however, sits a splendid old patriarch, with a long white beard, upper lip shaven like a New England farmer; and from his quiet gray eye there shines a glance of shrewdness, experience, and genially tolerant charity—a judicial type, if ever there was one; the kind you will meet by scores, if you have the enterprise to tramp it about the exhuberant plantations that encircle Valencia. But this tribunal has its active spirit also, the Regidor de Justicia, chosen by the bench to preside and take the lead in the ensuing discussions; and he is by far the most striking type of them all—a clean-built, broad-shouldered, short-necked man, whose square head, with its grizzled, close-cropped hair, and eager face seamed with many wrinkles, reminds one of the busts marked "B. C., Roman," in the sculpture galleries of European towns. It is, indeed, the very face of a Roman senator, suggestive not only of wise strength, but also of that persistence of racial type which any observer of his fellows can perceive all along this coast. We must understand that these men, selected from the farmers and water-managers of the huerta by a sort of *co-optatio* principle, serve for a fixed period (from six months to a year, I was told) without any emolument whatever, their honesty guaranteed by a union of principle with prudence; for, while the fundamental probity of the Spanish peasant in the simple relations of life is beyond question, the fact that each judge may at some other time be himself a seeker after justice confirms the disposition to give equitable decisions. From these findings there is absolutely no appeal; no court, no institution, no individual, can constitutionally claim the right even to examine the grounds of the conclusions arrived at. If, then, as all the bystanders assured me, isolated complaints are virtually unknown, what a testimony we have here to the continuance of the tradition of fairness which has preserved to this court its rude simplicity, its expeditiousness, and its popular support.

No ceremonial opens the proceedings. A sort of crier (not in uniform) calls the first case. Two peasants, of the kind who inhabit the thatched and whitewashed *barracas* of the huerta, step forward. One is waved to one side, while his opponent, in the fewest possible words, sets forth his grievance, with the interruption of a few pointed questions thrown in, here and there, in the same low undertone as that imposed by the court on the pleading peasant. Needless to add, that every one inside the railing is bareheaded, and the most complete silence prevails in the listening crowd. In five minutes the tale is over. After a joining of judicial heads, the opposing party is called upon for his story. Judgment (after a short whispered colloquy): "You are both equally in the wrong, according to your own showing. Have you any witnesses? No? Then you simply go back to your fields and your work, and be careful to observe the laws and customs of the water-system. Call the next case."

Here, the decision is not quite so simple, for another Latin disputant is at loggerheads with the one whom I have called a "Roman senator." It is difficult at first to make out whether this is really a case of hardship and grievance, or merely a trial of wits; the interchange of rapid sentence becomes more animated, until the fox-pleader, who has virtually ignored all the bench but the persistent Regidor, begins to speak in louder tones, to cast slurs on his opponent, almost to beard the judges. Discipline is absolute. One and all the judges unite in waving hushing hands and enjoining decorum on the complainant, who is forced to obey. Were he to persist in loud language, he would be fined; and further shortcoming would involve his immediate dismissal, judgment against him, and deprivation of water-rights for a term within the discretion of the court. My amiable neighbor informs me that the difficulty has arisen from the absence of an important witness. The excited litigant objects to the necessary week's delay, and has urged that the unscrupulous opponent will have full seven days more for misuse of privileges and inflicting damage. It is for this aspersion on his fellow-laborer's character that he has been called to order. The case is remanded for a week.

A third (the last) dispute is settled in most summary fashion. Scarcely has one of the peasants spoken for two minutes when a glance and nod among the judges declare that, unless testimony to the contrary be forthcoming, right is on his side; and as the somewhat shame-faced responder can offer neither denial nor contradicting witness, he is dismissed with a word of sensible warning. *La séance est levée*—after less than three-quarters of an hour! And the most remarkable part of it all is that one hears no grumbling, no biting comment, no hint of favoritism, no aspersion of character or capacity. Indeed, in the first and the last case, the contestants have gone off together to the nearest café, where I find them half an hour afterwards apparently on no hostile terms. What a moral lesson! No wonder that this "Court of Waters" retains its popularity. These Spanish peasants are neither specially litigious, nor specially fond of tricking one another, but the extremely hard conditions of their toiling lives render them willing enough to take advantage of unobserved favorable situations in the daily relations of economic existence.

Let me cite a corroborative instance. Last year (1903) in Valencia witnessed an unusual scene—the universal strike of the revenue officers who collect the provision duties (*octroi*) at the gates of the city. The suspension of duty lasted only about twenty-four hours, during which all the entrances to the city remained unguarded and open, the municipal authorities not venturing to shut the gates for fear of a general riot among the poor of the town. The result was that in that interval the surrounding peasants, who had got wind of the situation, provisioned the city with duty-free eatables enough for a several months' siege To judge from an account given me by a foreign resident, it might have been thought that all the live stock of the kingdom of Valencia had been sacrificed to that unique opportunity of turning a centimo at the expense of the civic government, so crowded were all the roads with vehicles of every kind, with rows or processions of neat-cattle, sheep, and pigs. Country carts were piled high with butcher's meat, and all about were cooked fowls, cheeses, vegetables—even sausages. During the whole of that time not a single tram-car was conveniently available for town passengers, under the constant siege of country women and baskets.

It is this readiness to seize upon an apparent momentary opportunity or advantage that renders necessary some strong and clearly defined power to regulate the constantly recurring complications of a system which distributes fertility over a vast area and involves the livelihood of thousands of peasants. Hence the finality of the decisions. But there is more; not a single *peseta* is paid by any postulant under any pretext whatever, and this, besides another peculiarity presently to be mentioned, gives this court its principal distinguishing characteristic. One is reminded, by contrast, of the cynical remark of the retired judge in Octave Mirbeau's 'La Robe Rouge': "Oui, la justice est gratuite; ce sont les moyens d'y arriver qui coûtent cher." Here, even to the supplying of the gaudy sofa (provided by ancestral arrangement with the chapter of the cathedral), there is not a single item of expense incurred in connection with any single case, save that complainant and respondent are bound to transport themselves at their own cost to the scene of trial.

But there is another conspicuously absent element in this most interesting of tribunals. A hundred paces away is the Audiencia, or Hall of Justice, of Valencia; indeed, from its windows one might easily look down on the proceedings of the peasant-judges; yet no lawyer in any capacity is ever known to take the slightest interest in discussions among the fundamental conditions of which is the unyielding principle that every litigant shall be his own counsel. I was informed that prior consultation with a man of law is a practice unknown, for the plain reason that irrigation-laws and customs are not recorded in official law books, but in the memory of every peasant from the time he begins, as a boy, to play about the small canals of the homestead. What little procedure is called for has been handed down by simple word of mouth from one set of judges to another; and, seeing that there are no papers of any sort, the inartistic, yet costly, law stamp can find no corner to adhere to. Again and again have the juridical powers of the district vainly attempted to obtain control of what could undoubtedly be turned into a field rich in fat fees.

Not the least interesting incident of this episode of travel was the chat and interchange of impressions with two chance travellers, urged by the same curiosity as myself. One of them, a retired American general, of the broadest liberal school in politics, shared likewise the feeling that talk of "lesser breeds" and "dying nations," which glides so easily out of the ever-open mouth of more than one expansionist, is the veriest vaporing in presence of a hard fact symbolizing the forethought, the wisdom, and the hereditary discipline of a splendid race. With the other interlocutor—a Madrileño, but closely related to Eleuterio Maisonnaave, the famous reforming politician of Catalonia—enthusiasm took on a more exuberantly eloquent character. The unrepentant liberal cordially thanked the stranger for an elementary openmindedness which, it would seem, the Spaniard does not usually expect to find in the for-

eigner who visits Iberian shores. Nevertheless, it seems but natural to be stirred by the spectacle of these simple, unassuming yeomen and peasants, who for centuries have followed the memorable maxim: "One foul sentence doth more hurt than many foul examples." P. T. L.

Correspondence.

OUR ART MUSEUMS AND THE INTERNATIONAL COLLECTION.

To the Editor of The Nation:

Sir: My attention has been recently called to a London letter in your issue of January 26, on "The International Society in London," in which the writer expresses his amazement at the lack of appreciation of American Museums as shown in their failure to secure certain works for their permanent collection.

A mild protest and an explanation may be opportune. It was not lack of appreciation, nor ignorance of the benefits to be derived from such a splendid collection as the drawings of Vierge, that prevented their acquisition somewhere on their journeys through American "towns." The absurd price placed upon the works of Vierge in particular and the entire collection in general was absolutely prohibitive. No one could possibly be induced to pay the prices asked for even less important works than those of Vierge. The American museums are, as a rule, not to be deterred from acquiring objects by the price asked; but in the case of the works which made up the International collection, it was simply out of the question to even think of purchasing them. That, and not lack of knowledge or appreciation, was the reason why there were no purchases for at least *one* American Museum.

As to the selection of work to represent American artists, it was most unfair and one-sided. The selections were made from a favored circle, and others, outside the pale, were ignored. Under such circumstances, it is not strange that the American showing should be "feeble and devoid of results."—Very truly yours, E. H. W.

St. Louis Museum of Fine Arts,
March 1, 1905.

THE VIGILANT BAEDEKER.

To the Editor of The Nation:

Sir: The writer on "El Tribunal de Aguas" in the *Nation* for March 2 states that "no familiar work of Spanish travel (not even Ford) devotes a single paragraph to this example of popular wisdom and forethought." In view of this statement it should, I think, be noted that Baedeker gives a succinct but adequate account of the *Tribunal de Aguas* or *de los Acequieros*, also called *La Corte de la Seo*, in his 'Handbook to Spain and Portugal' (2d ed., p. 308).

Yours, etc., James F. Muirhead.

Cambridge, Mass., March 5, 1905.

Notes.

Doubleday, Page & Co. will shortly publish 'The Opening of Tibet,' by Perceval Landon; 'Life of James Watt,' by Andrew Carnegie; 'Chopin,' by G. C. Ashton-Johnson; and 'How to Keep Bees,' by Anna S. Comstock. They report forthcoming Chinese and Russian editions of Booker Washington's 'Up from Slavery,' following versions that have appeared in the East Indies, Holland, Germany, Poland, Norway, France, and Spain.

Further announcements by Macmillan Co. are 'Christus Liberator: An Outline Study of Africa,' by Miss Ellen C. Parsons; 'China in Law and Commerce,' by Prof. J. Macbride Sterrett; 'Riding and Driving,' by Price Collier and Edward L. Anderson; and 'Alcestis, and Other Poems,' by Sara King Wiley.

A. Wessels Co. have nearly ready 'Cartoons in Rhyme and Line,' by Sir Wilfrid Lawson and F. Carruthers Gould.

From the Grafton Press we are to have 'Arizona Sketches,' by Dr. J. A. Munk; 'The Days and Hours of Raphael,' by Rachael LaFontaine; and 'Fifty and One Tales of Modern Fairyland,' by F. Strange Kolle.

A. C. McClurg & Co.'s spring announcements include 'Letters from an Oregon Ranch,' by "Katharine"; 'From the West to the West,' by Abigail Scott Duniway—a journey across the Plains in the early fifties; 'Iowa, the First Free State of the Louisiana Purchase,' by William Salter; 'The Athlete's Garland,' sporting verse, compiled by Wallace Rice; 'A Selection from the Great English Poets,' by Sherwin Cody; and the Scammon Lectures before the Art Institute of Chicago by Russell Sturgis.

Ginn & Co. will publish shortly 'The Greek Painters' Art,' by Irene Weir, art director of the Brookline (Mass.) public schools. A description of a recent journey to Greece is joined to chapters on vase painting, architectural coloring, Greco-Egyptian portraits and Greco-Roman mosaics, and mural painting in Greece and Italy.

Houghton, Mifflin & Co.'s spring list includes the Complete Poetical and Prose Works of George Herbert, in three volumes, edited by George Herbert Palmer; the Complete Poetical and Dramatic Works of Lord Byron, edited in one volume (Cambridge Edition) by Paul Elmer More; 'Later Poems,' by John White Chadwick; 'The Shoes that Danced, and Other Poems,' by Anna Hempstead Branch; 'Essays in Puritanism,' by Andrew Macphail; 'The Far Eastern Tropics: Studies in the Administration of Tropical Dependencies,' by Alleyne Ireland; 'Manual of the Trees of North America (exclusive of Mexico),' by Charles Sprague Sargent; 'Wasps: Social and Solitary,' by George W. and Elizabeth G. Peckham; and 'Wild Wings: Adventures of a Camera Hunter among the Larger Wild Birds of America on Land and Sea,' by Herbert Keightley Job.

The Oxford University Press (H. Frowde) is about to publish 'Cantonese Love Songs,' with Chinese text, glossary and translation by Cecil Clementi of Hong Kong; 'Select Documents Illustrative of the History of the French Revolution,' edited in two volumes by L. G. Wickham Legg from strictly contemporaneous writings, mainly periodical literature; 'The Farther East,' by Archibald Little; 'The Faroes and Iceland,' by Nelson Annandale; 'Corps de Droit Ottoman,' by George Young, second secretary of the English Embassy, in seven volumes; a Concordance of Dante's Italian Prose Works and of the Canzoniere, by E. S. Sheldon; 'Early Patristic Quotations from the New Testament,' by A. J. Carlyle and others; an authorized translation of Schiaparelli's 'Astronomy in the Old Testament'; 'An Outline Dictionary,' intended as an aid in the study of the languages of the Bantu (African) and other uncivilized races, edited by A. C. Madan; Johnson's 'Lives of the Poets,' edited in three volumes by the late G. Birkbeck Hill; 'The Minor Caroline Poets,' edited with introductions by Prof. George Saintsbury; 'The Plays and Poems of Robert Greene,' edited by J. Churton Collins; and 'The Lyrical Poems of Blake,' edited by John Sampson.

The literary remains of Theodor Herzl have been found to be very extensive, and his writings on Zionism are soon to be published with the title 'Theodor Herzl's Sämtliche Zionistische Schriften,' consisting chiefly of essays and addresses. The work will be edited by Prof. L. Kellner, who, in the last will of the Zionite leader, was appointed his literary executor. In connection with it a biography of Herzl from the pen of Max Nordau will appear. Herzl's chief monument, however, will be his Diary, in eighteen "books," which reports the Zionist movement from its very beginning to the death of the author. It has, however, not yet been definitely decided when this *Tagebuch* is to be published, if at all.

The publishing house of Victoriano Suarez of Madrid is publishing a new series of books on American history, entitled "Colección de libros y documentos referentes á la historia de América." The first three volumes have already appeared. Volume I. is a review of the Jesuit missions near the headwaters of the Amazon River in the country of the Maynas, and was written, by command of the Jesuit superior at Quito, in 1661, by Francisco de Figueroa, S. J., a Spanish-American. Its title is, 'Relación de las misiones de la Compañía de Jesús en el pais de los Maynas,' and it is a typical Jesuit relation, full of keen observation, thrilling scenes of hardship and danger, customs of the Indians, etc., and some valuable history. Volumes II. and III. are the first two instalments of the "Quinquenarios" of Pedro Gutiérrez de Santa Clara, in the main the story of the revolution in Peru (1544-1548) which was the first instituted attempt against constituted Spanish authority in the new world. Its author was probably a Spanish mestizo and a native of New Spain, and, best of all, was not an ecclesiastic, but a part of the scenes that he describes so vividly. His book is very readable, and contains much that is valuable to the student. As a series the publication has some drawbacks, and obviously the following: the lack of a list of the documents, of which the Spanish archives contain so many still unpublished, that are to be published; the lack of a general editor to lick the work into shape and to set definite bounds to it; the lack of a general introduction that would reveal the proposed scope of the work; the almost utter absence of notes, most of the slight annotation consisting of bibliographical notes in the introductions to the separate works, and of notes in the text proper showing erasures in the original manuscript or emendations made by the editor; the want of illustrations, especially good maps, of which

there are many manuscript ones in the Spanish archives that have never been published; and the omission of an index, for we fear there is no hope of a general index to the series. On the other hand, the typographical arrangement is neat, and the size of the volumes handy for the reader. The introductions accompanying the several works are useful, and the bibliographical notes extremely so. Documents are carefully reproduced in the old orthography and capitalization, and the press-marks of the original manuscripts conscientiously given.

G. P. Putnam's Sons have united with the London house of J. M. Dent & Co. in the production of a much desiderated series of French reprints, "Les Classiques Français." It is in pocket form, bound in flexible olive-green lambskin covers, richly gilt, and printed in small but thoroughly legible type, with a regulation portrait, a preface by some recognized man of letters, and a bibliography of editions (supplied by the general editor, Mr. D. S. O'Connor). To view is to be captivated. We have before us Chateaubriand's 'Atala, René, Le Dernier Abencérage,' in one volume, with an introduction by Melchior de Vogüé, and 'Contes Choisis' from Balzac, with a preface by Paul Bourget. The range of selection promises to be very extensive.

While the foregoing enterprise is aimed at readers, familiar with French, who do not desire notes, or regard them as detracting from their pleasure, the Oxford Modern French Series, edited by Leon Delbos (H. Frowde), is primarily intended for students. These text-books, then, are correspondingly sober in their attire, without and within, with an eye to cheapness, and are moderately annotated at the end, with less reference to linguistic difficulties than to literary and historical allusion. The initial numbers are Jules David's 'Le Serment,' edited by Cécil Hugon, and Thierry's 'Les Normands en Angleterre et en France,' edited by A. H. Smith; and in size they exemplify the varying price, according to bulk, viz., eighteenpence and two shillings sixpence; two and three shillings being demanded in other cases.

'Collier's Self-Indexing Annual, 1905' (P. F. Collier & Son), is "self-indexing" like any other alphabetically ordered handbook; but a large portion of this bulky quarto is not "annual" matter in any proper sense of the word. Take the rubric Gymnastics, for example, which makes no pretence of being related to the "history of men and events of the past year"; or the University of Notre Dame, Indiana; or the Luther League of America; or the Monroe Doctrine (with no fresh illustrations); or Hay (statistics for 1903). Numerous entries of societies are justified only on the ground of the election of officers in 1904. They might better have been tabulated. Many others are utterly trivial, like McLean (Dolores) or Sipido. There is no index to help one through the maze of information, or to open up the abundant illustrations. There is even no alphabetic catchline aid to reference. In short, constructively this annual is as much behind the times as is possible. It is a jumble of borrowings from *Collier's Weekly* and of special articles in no way remarkable. It cannot be said to have been edited.

The ever fresh, authoritative, and stimulating year book, 'Burdett's Hospitals and Charities,' for 1905 (London: The Scientific Press), is able to exhibit for the first time the resources and expenditure of the ninety-four voluntary hospitals in the county of London for a period of ten years, during which a uniform system of accounts has been enforced. Such a showing could not fail to reveal excessive expenditure in some institutions and point the way to retrenchment. This is the world's statistical directory for the institutions contemplated, but it is also characterized by most useful discussions, here occupying fourteen chapters.

'The Land of the Future,' by Wilhelm von Polenz, which now appears in an English translation (Brentano's), although much shorter than Professor Münsterberg's imposing work, has much in common with it and covers briefly about the same ground. It is not quite so laudatory of everything American, but is evidently inspired by a desire to be perfectly just, and contains very little that can wound the self-love of the most sensitive American reader. Even its severest censures are mingled with exculpatory praises, and are tempered by intimations that, as this is the land of the future, it cannot be fairly expected to vie in every respect with European countries which have a long past behind them, and have not gone through so hurried a development. Of course, there are some droll mistakes, but they are comparatively few, and it speaks well for the author's judgment and powers of observation that he has produced what is, on the whole, a correct account of our country. Several of the recent works of German writers on American conditions have been written with such fulness of knowledge that there is really no reason why the intelligent German public should remain under any false impression about our institutions and tendencies. It is to be regretted that the present work is so poorly translated.

Into one volume of 636 pages, Mr. Charles H. Cochrane, the author of 'Modern Industrial Progress' (Philadelphia: Lippincott), who glares at us viciously as "Yours for progression" out of the frontispiece, compresses a description of 43 phases of modern progress, illustrated by 405 half-tone illustrations, largely borrowed from trade catalogues. The contents cover a bewildering diversity of subjects, from mining to flying, from ploughing to printing, from transportation by horse and wagon to rushing through space by rail and automobile. The work is therefore encyclopædic in scope, and, as it is the production of a single mind, is neither profound in treatment nor remarkable for accuracy. If read continuously, it leaves on the mind somewhat the same impression as the perusal of a condensed edition of Webster's Dictionary; and carelessness in composition and revision makes many of the sentences, to say the least, ambiguous. Take the following, which is printed without punctuation: "The autoplate consists of a casting mechanism and a series of finishing mechanisms which automatically coöperate in one machine to do the entire work that was formerly done on four or five hand machines at a single operation." As a scientific treatise, the book is worthless. As a popular survey of modern progress, were it more carefully written and more generously indexed, it would be useful. Moreover, were its quality commensurate with its weight to the hand, it would be invaluable.

'The Old Shipmasters of Salem, with Mention of Eminent Merchants,' by Charles E. Trow (G. P. Putnam's Sons), is a plain story, well told, of the old merchant captains who used to sail square-rigged vessels out of the Massachusetts port to the East Indies, a hundred years or so ago; and of later voyages, down to the decline and extinction of that once-flourishing industry. The field of narration is not extensive, and the subject is treated with all the fulness it deserves. The writer commands an excellent style, and the text is freely illustrated. The portraits of some of these marine worthies are of more than passing interest. That of Capt. Joseph Peabody (1757-1844), for instance, represents a man of handsome features, denoting intellect and power. There are several pictures of ships. While the author has done well to gather his material and present it in so acceptable a shape, he is another in the list of sinners who send out a book, historical in character, and provide for it no index.

Mrs. Elizabeth H. Schenck's 'History of Fairfield, Conn.,' begun twenty-five years ago, and issued in a first volume nine years later, is now concluded with volume ii., bringing the narrative down from 1700 to the close of the Revolution. It is a bulky work, and the new volume is open to the objection we made to the first, that too much extraneous history is introduced. In the main text it is hardly possible to follow a clear thread of the town's development. In fact, one must go to the appendices for the local color. Here we have vivid pictures in depositions from women regarding the plunder and burning of Fairfield by the Hessians in 1779, during one of Tryon's inhuman coast raids; a certain number of genealogies; and, of especial value, the first extant parish record of Christ's Church, from 1694 to 1805, filling sixty-one pages of fine print in double columns. To have indexed this would have swelled the book by an amount easily subtracted from the irrelevant text. The volume bears the imprint of J. J. Little & Co., New York. Mrs. Schenck's address is No. 2026 R Street, Washington, D. C.

A well-printed, thin volume of seventy-one pages, from the Grafton Press, New York, bears the title 'Concerning Genealogies: Being Suggestions of Value for All Interested in Family History,' by Frank Allaben. One finds little that is new or striking in these rather cleverly written pages. The suggestions which the author makes most prominent are that he knows who can give the best help to an inexperienced worker in this field, and also a press where the book had better be printed.

In view of a recent attempt to arouse public interest in the importance of fostering the reproduction in exact facsimile of books useful to students, there may be some curiosity regarding the number of American libraries that have contributed to the success of the reissue of Friar Colonna's 'Poliphili Hypnerotomachia,' by Methuen & Co., London. The original edition, printed by Aldus at Venice in 1499, has always been one of the most desired of all the productions of that famous press. Lovers of fine books; amateurs interested in the history of printing or engraving, of art or literature; collectors of choice or uncommon editions; and those who seek for what

is euphemistically called "curious," will all find much to their liking in this new edition of the work. But the 'Hypnerotomachia' ought to be much more than a collector's book. It is comparatively little known, perhaps because, as Renouard pointed out long ago, so many more famous artists and authors have borrowed from its superabundance of ideas and suggestions that they have all hesitated to call attention to the source of their inspiration. Nevertheless, it has a well-established place in the history of mediæval life and literature.

The January issue of the Essex Institute Historical Collections (Salem, Mass.) is wholly taken up with the local proceedings on the hundredth anniversary of Hawthorne's birth, under the auspices of the Institute. Besides the set addresses (one from Dr. Edward W. Emerson), numerous letters and appreciations are printed—from Mr. Choate, Henry James, Mrs. Humphry Ward, Andrew Lang, Mr. Bryce, and others. On the same date (conventional, not the true birthday), June 23, 1904, was held the first reunion of the descendants of Major William Hawthorne and his brother John (a settler in Lynn), and this too is reported. Mr. Henry F. Waters's account of his discoveries among English wills of the English ancestors of Hawthorne, substantial yeomen of Berkshire, surpasses all else in interest. Affixed are lists of Hawthorne souvenirs and relics and first editions exhibited concurrently at the Institute.

The mountains of Turkestan form the subject of an unusually readable article in the *Geographical Journal* for February, by Mr. Ellsworth Huntington. His aim is to draw attention to the relationship between all that goes to make up the earth and air of these mountains on the one hand, and all that makes up their life, whether vegetable, animal, or human, on the other. In showing this intimate connection he pictures most entertainingly the nomadic life and character, demonstrating particularly how her environment makes the "Khirgiz wife stronger, more capable, and more self-reliant, and hence a better and more loving mother." Of greater local interest is Prof. J. W. Spencer's description, with charts and sections, of the submarine great cañon of the Hudson River, which was first noticed by Prof. J. D. Dana. Beginning some thirty miles outside of Sandy Hook, it is nearly twenty miles long, and from 1,000 to 4,800 feet below sea-level, and develops into a valley 9,000 feet deep. Among the other contents are an account of the McMillan expedition to Southwestern Abyssinia, by B. H. Jessen, and descriptive notes, by Dr. Tempest Anderson, of some striking photographs of Stromboli, showing the changes in the crater since 1888. The finding of a new genus of algæ, by the *Discovery* expedition in the Antarctic Ocean, named *Clementsia Markhamiana*, is chronicled by Mr. George Murray, with illustrations. The peculiar interest of this type lies not only in its unique character as an oceanic plant, but in its significance from the point of view of the geographical distribution of such organisms. Its nearest allies are found in fresh water.

—The literary interest stands foremost this month in the *Atlantic*. Goldwin Smith makes a very vigorous retort to the adverse criticism of Walter Scott's poetry contributed to the November number by Mr. Arthur Symons. He admits that it takes something of the boy to read "Marmion" with delight; but if it be that part of the boy which a man of Goldwin Smith's tastes and attainments may carry through eighty-two years, it must be acknowledged that Mr. Symons has not seriously lowered Scott's rank on the slopes of Parnassus by dubbing him a poet for boys. Elizabeth Robins Pennell contributes a paper on "A Bundle of Old Letters," the papers of her uncle, Charles Godfrey Leland. In describing how the American diplomat was made at the time of Mr. Leland's occupancy of the Turkish mission, "or was made before the idea of the so-called Civil Service entered into the policy of Washington," Mrs. Pennell apparently labors under the impression that American ministers are selected by competitive examination. After relating an occasion on which "the Rye" achieved the honor of thanks from his Government for success in dealing with the difficult Turk, she adds, "I wonder to how many of his already forgotten successors it has happened." Evidently Mrs. Pennell is not thoroughly informed as to the history of the Turkish mission. James Sully gives some interesting recollections culled from his long years of intimacy with Sir Leslie Stephen, and T. W. Higginson presents a paper on "The Close of the Victorian Epoch," taking the deaths of Herbert Spencer and Philip James Bailey as the definitive turning of the page. Spencer, Darwin, Lord Houghton, Aubrey de Vere, Bailey, Jowett, and Alexander J. Ellis are the names to which Mr. Higginson gives special attention. The continuation of Thoreau's Journal can hardly be said to present anything likely to strengthen his hold upon the present generation. By far the best of the Walden philosopher has long been available, and the utility of publishing the second best is questionable.

—The chief paper of serious interest in the March *Scribner's* is the third of Mr. Vanderlip's studies in current political problems of Europe. This writer takes up methods of education, giving the lion's share of attention to Germany, and showing a very evident admiration for what he regards as the German ideal—that is, the transformation of each student into the most effective economic unit which it is possible to produce. He is apparently convinced that a nation's life consists chiefly in the abundance of material possessions acquired, and would be quite willing to see our own traditional ideal of education primarily for intelligent citizenship radically altered. In the French system he finds nothing but a mechanical preparation for examinations admitting to the public service, and in this fact alone he sees an adequate explanation of the relative backwardness of France in modern industrial progress. England has not yet risen to the point of having an educational ideal. "No British statesman seems ever to have conceived that a perfect system of education would redound to national greatness." The statesmen who found a way to raise one billion two hundred million dollars for the conquest of the Boers, do not feel that the Government can afford to recognize any new claims on the budget for the support of education. On the artistic side, nothing in this number compares with the series of tinted reproductions of Indian types, thirteen in number, from photographs by E. S. Curtis. George Bird Grinnell, who writes the accompanying text, is well within bounds in saying that if Mr. Curtis shall have life and health to go on with his accumulations of material for ten years, he will have the basis for the greatest artistic and historical work in American ethnology ever attempted.

—President Eliot presents, in the March *Harper's*, another of his thoughtful papers on the troubled relations between capital and labor. The associations of employers form the special topic. All such associations, he holds, should be brought to the test of their relation to private and public liberty. So far as their policies tend, in practical execution, to promote such liberty, they are worthy of hearty approval. Taking up for analysis the declared aims of a single organization, he finds these aims to be as follows: No closed shop; no restriction as to the use of tools, machinery, or materials, except such as are unsafe; no limitation of output; no restriction in number of apprentices and helpers when of proper age; no boycott; no sympathetic strike; no sacrifice of the non-union workman to the union, and no compulsory use of the union label. Each and every one of these points he emphatically approves. Prof. John Bassett Moore contributes a sketch of our actual experience in international arbitration, and recent attempts to promote the principle by general treaties. No definite line, he holds, can be drawn between classes of questions which may rightly be arbitrated and those which may not. The extent and usefulness of the method must be determined largely by public sentiment. Chemistry, ethnology, and botany are each honored with a paper of "popular science" type so frequent now in the magazines. W. Carew Haslitt presents with appropriate comments a few hitherto unpublished letters of Lamb's.

—A very illuminative exhibition of the *anima poetæ* is found in the facsimile of Keats's autograph manuscript of "Hyperion," edited by Mr. Ernest Sélincourt and published at the Clarendon Press (H. Frowde). This manuscript, which is now the property of the British Museum, seems to have been intended by Keats as the final revision of the poem for the press, although after he set to work upon it his mood became so creative and his alterations so numerous, that it was deemed better to have one of the clerks in the office of his friend Woodhouse make a clean copy for the printers. The manuscript, therefore, represents a form of the poem intermediate between the first draft and the printed text of the first edition, and it is rich in traces of the operation of the poet's mind. Mr. Sélincourt has studied all the corrections and differences with a very painstaking subtlety, and in his ample notes on the variations of the manuscript from the printed text of "Hyperion" will be found excellent material toward a poetic. A single example must suffice. The form of the fine lines—

> "Until at length old Saturn lifted up
> His faded eyes and saw his kingdom gone,"

was, in the latter line, as Keats first wrote it in the present manuscript,

> "His eyes and saw his royal kingdom gone."

"But as he copied," says Mr. Sélincourt, "he recognized the tautology of *royal kingdom* and decided to give an epithet to *eyes*.

First he tried *faint blue*, but deleted it in favor of *faded*, which suggested more forcibly Saturn's loss of royal power, and is doubtless an unconscious reminiscence of the *faded cheek* of Satan ('Paradise Lost,' i., 602)." Nearly all the emendations in the manuscript are calculated to make the tone of the poem more Miltonic. The significant thing about them to a student of poetry is that they show how—the initial energy of conception being granted—there is as much flavor and zest of personality in the considerate refining of revision, in the afterthought and labor of the file, as in the spontaneous ebullition; reminding us again that poetry is a fine art as well as a form of vaticination.

—Mr. Sélincourt appends to the facsimile of the autograph of "Hyperion" an uncommonly interesting transliteration of the manuscript of "The Fall of Hyperion: A Dream." This again shows some important differences from the printed text, the most important of them being the inclusion between lines 186 and 187 of the printed poem, of a passage of twenty-four lines which, for some unaccountable reason, was rejected by Woodhouse. The concluding lines of this passage are of the first moment for a lover of Keats, showing as they do how, at the end of his short day as a romantic poet, he had become aware of the seeds of decay which were in Romanticism itself:

> "Apollo! faded! O far-flown Apollo,
> Where is thy misty pestilence to creep
> Into the dwellings, through the door crannies
> Of all mock lyrists, large self-worshippers
> And careless hectorers in proud, bad verse?
> Though I breathe death with them, it will be life
> To see them sprawl before me into graves."

Keats wrote upon a foolscap folio, so that the facsimile has necessarily been printed in a tall folio. The facsimile itself is admirable, and the letterpress little less so. Barring the bad paste used in the binding, this is in every way a satisfactory book.

—During a recent visit to Rouen, Prof. Arthur L. Frothingham, jr., of Princeton University made an interesting discovery in the small archæological museum of that city. His attention was attracted to a beautiful model of the well-known late-Gothic Church of Saint Maclou. This model had hitherto been considered by the local authorities to be a miniature copy from the completed church; and in the catalogue of the museum it was set down as the work of a priest who had spent ten years of his life in making it. Professor Frothingham was at once struck by the beauty of the art and workmanship, and, after making a thorough study of it, comparing it in detail with the church, he became convinced that this was the original model made by the architect who planned the building. His conclusions excited the interest of the most prominent specialists in Gothic architecture in France, and on the 8th of February he was invited to speak on the subject before the Société Nationale des Antiquaires de France in Paris. The most notable of the French savants in the mediæval field were present, and the Comte de Lasteyrie, the chief authority on Gothic architecture, accepted all of Professor Frothingham's findings, and in a few words called attention to the importance of the result. Up to this time it had been held that no original architect's model of a Gothic building existed in France. Professor Frothingham demonstrated that this model of Saint Maclou could not have been executed at any time when Gothic art did not flourish, and that, as in many points it differed from the finished church, the architects and builders who carried out the original design departed from the model. Moreover, these variations showed a poorer art, both in richness of ornamentation and in beauty of line and detail, and confirmed the supposition that the model was the original design made by the architect before the church was begun, and submitted by him for approval to the board of directors who had charge of the financial part of the enterprise. From his previous study of the subject, Professor Frothingham inferred that architects' models were always designed for the practical purpose of having a plan accepted. As this is the only work of the kind that has survived from the Middle Ages, it possesses extraordinary interest for the student of to-day. It is noteworthy that the spire of the model is our only evidence of the original appearance of the church when completed, as its spire was destroyed in the eighteenth century and the present one is a modern construction. The model, which dates from before 1436, is a work of art of great beauty from the hand of a master architect. It is finished to the smallest detail, indicating every statuette, gargoyle, pinnacle, and bit of tracery. The material is papier-maché on a wood frame. Professor Frothingham has had some large photographs of the model made, and two of these will be reproduced in Dujardin (heliogravure) plates, to illustrate the monograph which he has prepared, and which will be published in the sumptuous French publication, "Monuments Piot" or "Monuments et Mémoires publiés par l'Académie des Inscriptions et Belles Lettres."

OSLER'S ADDRESSES.

Æquanimitas: With Other Addresses to Medical Students, Nurses, and Practitioners of Medicine. By William Osler, M.D., F.R.S., Professor of Medicine, Johns Hopkins University, Baltimore. London: H. K. Lewis. 1904.

Dr. William Osler, about to leave this country for the Regius Professorship of Medicine in the University of Oxford, has published a sort of valedictory volume, almost if not quite as interesting to the laity as to the profession of which he is a distinguished ornament. It is a collection of eighteen addresses and essays prepared at various times (between 1889 and 1903), all pertinent to medicine. As Dr. Osler is one of the men who have avocations as well as a vocation, those who know him will expect to find that two noteworthy characteristics, his love of literature and his good humor, are blended with his medicine. They will not be disappointed. In the phraseology of pharmacy, his pills are sugar-coated, and his potions are elegant extracts. We may almost say that he has unconsciously written an autobiography—not the annals of his life, nor the story of the friends with whom he has been associated, but he has given his thoughts on education; on investigation; on the relation of physicians to patients and to nurses; on ethics; guardedly, on religion; and fully, on the conduct of life. From these *disjecta membra poetæ* a psychological anatomist, if he had tact and time, might perhaps reconstruct, after Cuvier's example, *Osler redivivus*—at least so far as head, heart, and hands are concerned.

In view of Dr. Osler's transit, it might be worth while to enumerate those writings of his which are strictly medical, and to recapitulate the events of his peripatetic career in Toronto, Montreal, Philadelphia, and especially in Baltimore, where for fifteen years he has been the medical chief in the Johns Hopkins foundations; but our remarks will be confined to the volume 'Æquanimitas.' This title gives the keynote to most of his utterances. On his first page he declares that in the physician and surgeon no quality takes rank with imperturbability. Imperturbable the author is, at the bedside or on the platform, making a diagnosis or a speech, before a clinic or an assembly of sexagenarians (when he points out the danger-point of advancing age). Nothing ruffles his disposition. He avows that his recreation is bibliography, but his record shows that his real recreation is in reading. He seldom makes an exact citation from his favorite writers, but his allusions to them are interwoven with all his discourses, often in a very subtle manner. There is a background of Biblical knowledge. Plato is frequently referred to—indeed, one paper is on Medicine in Plato. Marcus Aurelius and Sir Thomas Browne are especial favorites of his; Shakspere is often quoted, and from Osler's pages a long list of poets, from Milton to Arnold, might be constructed as a trustworthy guide to modern English literature, illuminated by appropriate epithets. It is English writers, however, and not Continental, who have chiefly attracted him. No one would suspect that Dante or Goethe was his familiar spirit. All this is exemplified by the titles of the ten volumes which he recommends, at the close of his book, as a "Bedside Library for Medical Students," to wit: The Old and New Testaments; Shakspere; Montaigne; Plutarch's Lives; Marcus Aurelius; Epictetus; 'Religio Medici'; 'Don Quixote'; Emerson; Oliver Wendell Holmes—'Breakfast Table' series.

The essays in this volume are historical, including a review of Medical Science in the nineteenth century. The addresses were delivered on academic occasions, when the speaker appeared as a teacher, not as the investigator, nor as the historian. Students, rather than colleagues, are usually in his mind; but he has an eye also to a wider circle. For example, Dr. Osler constantly recurs to the need of enlarged endowments for medical education if the new school of medicine is to fulfil its work. A great university, he says, has a dual function—teaching and thinking. The effort should therefore be made to secure professors who can add to the store of the world's knowledge. Every gift which promotes higher medical education means fewer mistakes, greater skill, and the saving of pain and anxiety to countless numbers. An institution which does not look beyond college gates in selecting professors may get good teachers, but rarely good thinkers. Parochialism is a dangerous snare. Closely allied to these citations are the remarks of Dr. Osler on the hospital as a college, wherein his own experience in the Johns Hopkins Medical School is carefully described. He predicts that, in the next quarter of a century, the larger universities in this country will, like Johns Hopkins, have their

own hospitals, in which the problems of nature known as disease will be studied as thoroughly as are those of geology or Sanskrit. His rule of three is this: "As laboratories are to the physical sciences, so are hospitals to schools of medicine."

In every paper Dr. Osler is the advocate of scientific methods—exact observations, careful records, modern appliances. Of "The New School in Medicine" he is a persuasive defender. "The three great advances of the century have been the control of epidemics, anæsthetics, and antisepsis." Thus, he says: "We have seen a complete revolution in the practice of medicine, and what has been accomplished by the new school is only an earnest of what the future has in store." This, he admits, is no new method, but the old method of Boerhaave, Rutherford, Hunter, now supported and amplified by modern facilities, laboratories, and instruments. A man cannot become a competent surgeon without a full knowledge of human anatomy and physiology; so the physician, without physiology and chemistry, flounders along in an aimless fashion, never able to gain any accurate conception of disease, practising a sort of popgun pharmacy, hitting now the malady and again the patient, he himself not knowing which. Here are some evidences that the author is no druggist. We no longer live, he says, in a fool's paradise, and fondly imagine that in all cases we control the issues of life and death with our pills and potions. Common sense in matters medical is rare; usually in inverse ratio to the degree of education. Clergymen, he continues, are notorious supporters of nostrums, and the further they have wandered from the decrees of the Council of Trent, the more apt are they to be steeped in thaumaturgic and Galenical superstition. Man has an inborn craving for medicine. Heroic dosing for several generations has given his tissues a thirst for drugs, and, with improved preparations, we are in danger of polypharmacy, the emancipation from which has been the sole gift of Hahnemann and his followers to the race.

Here are some counsels of our medical adviser to young physicians. In one of the Jungle Stories, Mowgli wished to be avenged on the villagers, and he could get the help he needed only by sending the Master Word. "This I propose to give you," says our author. "It is the secret of life as I have seen the game played and as I have tried to play it myself." Then comes this inspiring passage:
